CONGRATULATIONS are in order for three Pennsylvania county agents and their wives. Born: to Mr. and Mrs. R. R. Burtner, of Dauphin County, a daughter; to Mr. and Mrs. R. B. Dunlap, of Blair County, a daughter; to Mr. and Mrs. L. F. Rothrock, of Perry County, a daughter.

* * *

When they summarized their cost of production records recently the members of a Juniata County poultry club found it was costing some of them twenty-one cents a dozen to produce eggs, and others as much as $1.45 a dozen.

* * *

In an effort to cut down the percentage of rejections the Centre County Sheep and Wool Growers' Association recently decided to tax its members two cents per pound next year for all wool not properly tied with paper twine.

* * *

Yale University is planning a new library which will cost $6,000,000 and will have room for 5,000,000 books. If one person could read two books a day, 365 days in the year, it would take nearly 7000 years to read all of those 5,0000,000 books.

* * *

Several people in Philadelphia recently saw a woman fall on the street, overcome by sudden illness. Shortly afterward telephone calls began coming into the nearest police station. One person said there was a fire where the woman fell; another reported a murder; another said bandits were around and they had killed one woman and wounded others. These alarms were followed by reports of explosions in a manhole, in a cellar, and by a bomb. Further proof that people don't see alike.

* * *

More than 20,000 persons were reported lost in New York last year. Most of them were traced by the police, but about 300 have disappeared, and probably will never be heard of again.

* * *

The United States has been importing wool from South America for 110 years. Much of this wool comes to Philadelphia. The total foreign trade of Philadelphia is reported to amount to about two billion dollars a year ($2,000,000,000).

* * *

Naturalists have found 770 varieties of flowers growing wild in regions north of the Arctic Circle.

* * *

George Washington wore size eleven shoes and his hands were so large that he had to have all his gloves made to order.

* * *

Icebergs are not made of ice, but of compressed snow which fell fifteen or twenty thousand years ago and has spent the most of the time since then as part of glaciers in the arctic regions.

Did you ever hear this one?—

The flower show had been a great success, and a few evenings later Mr. Blank, who had performed the opening ceremony, was reading the local paper's report of it to his wife.

Presently he stopped reading, his justifiable pride turning to anger. Snatching up his stick, he rushed from the room. Amazed his wife picked up the newspaper to ascertain the reason of her spouse's fury.

She read: "As Mr. Blank mounted the platform, all eyes were fixed on the large red 'nose' he displayed. Only years of patient cultivation could have produced an object of such brilliance."—Western Christian Advocate.

"Why are you hopping around like that?"

"My doctor told me to take my medicine three nights running and then skip a night. This is my night to skip."

Willie and his little sister were visiting at a mountain resort where they heard a great deal of talk of the fine view. One day the sister fell over the edge of the piazza, and Willie ran screaming to his mother:

"Oh, mama! Come quick! Bessie has fallen into the view!"

"Pa, what's phonetic spelling?"

"It's a way of spelling that I often got whipped for when I was your age," replied Pa.—Boston Transcript.

"William," snapped the dear lady viciously, "didn't I hear the clock strike two as you came in?"

"You did, my dear. It started to strike ten, but I stopped it to keep it from waking you up."—Tit-Bits.

"Abner," said the mother, "there were two pieces of cake in the pantry this morning and there is only one now. How does this happen?"

"It musta been so dark that I didn't see the other piece."

Robert Fulton years ago
Said he'd make the steamboat go,
And stuck to it.
Robert's friends began to jolly,
Called the steamboat Fulton's Folly,
But the darn thing went by golly,
He stuck to it

OUR YOUNG PEOPLE'S FORUM

Now Is the Time to Plan Homes for the Birds

WHEN the wrens come again have some nice little houses put up about the lawn and garden for them.

They should be put up early so they will be somewhat weather-beaten before the birds come. Wrens do not come until late in April or early in May but the first thing they do is to look for a home site.

It may be that none will come to inhabit these houses the first year, but they will come eventually.

The first time the wrens nested near my home they found a nice cosy corner on top of the corner post of the front porch. Little boards had been tacked across the corner to keep the English sparrows from nesting there. There was only a very small opening above the board where Mrs. Jenny Wren went in to make her home. When they came back the next year they went thru the lattice work under the porch and built a nest in a small tin can which stood about two feet above the ground.

A Queer Place to Build

The third year when they returned they began looking over the wash hanging on the line. Several pairs of men's overalls were there. The wrens looked them all over and went down inside to find a place for a home. Had the legs been tied shut at the bottom I believe they would have begun to build a nest.

When I saw how much they wanted a home near the house, I made a little box for them. They went into it almost as soon as it was placed on a corner of the grape arbor, and before the little birds left this box another little house was made and put up nearby.

As soon as the little birds flew away the parent birds cleaned out part of the nesting material, working harder to get it out than they did to put it in. When they had cleaned house to their satisfaction they began to carry material for a new nest in the other house for a second brood. Wrens like a new house for each family they raise.

The house wrens are tireless bug hunters, carrying bugs and worms all day long to feed their young. They are also tireless and joyous singers, singing from the break of day till dark during the nesting season. I have never heard them sing after the last little bird leaves the nest late in July or the first of August. They sing while in flight and with a mouthful of food which they are carrying for their young.

Now I have eight houses about the lawn and garden for wrens and they were all occupied last season. We like them in the garden for they destroy hundreds of harmful bugs and worms.

Hanging houses are the best to use as there is then no danger of a cat getting at the nest. Houses put on poles can be made safe by putting tin about the pole in a funnel shape, turned down so that a cat cannot get up.

The openings in the boxes for wrens must not be larger than one inch or the English sparrows will get in. There should be a neat little perch below the opening for they light there with long pieces of nesting material and often have to work quite a while to get the end of the twig into the opening. The foundation of their nests is bits of twigs, from one inch to four or five inches long. Then comes a lining of hairs and feathers found about the poultry yard.

The houses may be hung on the porch or in any trees near the house.

A house hangs on the end of our front porch, and the wrens build and hatch one or two broods there each year. They will perch on the backs of chairs and on the swing chains. Sometimes, after the little birds come, they will scold when some one sits near the end of the porch where the house hangs but they soon learn to know that no harm is meant and resume their song.—Mary A. Kintigh.

(To be continued)

From Forum Friends

Dear Friends:—I have never lived on a farm and never expect to. I don't know how we happened to take Pennsylvania Farmer but we do and have for a long time. I live in a town.

I am a sophomore in high school. This week has been exams. Thank goodness I had no regents or I would be so exhausted I would not be writing this letter but I had no half-year subjects. I went down this morning to school to look at the bulletin board to see if the marks had been posted. They had and I passed all my exams. It is a miracle for they were all very hard and I never expected to make French or ancient history but I did.

Ruth Weir
Franklin Co., Pa.

Sledding and skiing are great. Every night we go on "Kelly's," a great big hill in town. It's wonderful. The boys build large fires and we keep warm at the top of the hill when we're not sliding.

I have no brothers or sisters but as I live in town I have many, many friends. There isn't a week goes by but what there is a party somewhere, and there are movies twice a week.

I belong to the Girl Scouts, Troop 2, and the Junior Girls Friendly. Monday nights are the Friendly meetings and Thursday nights are the Scouts. I have been a Scout four years and go to camp every summer. I am corporal of the Bluebird Patrol which is considered quite an honor in our troop as it is so large and the older girls are the ones who hold office.

Tonight there is to be a sleigh-ride and a party. I am invited to both but don't know which to attend. I think it will be the sleigh-ride.

I have a bike, also four or five of my friends have them. We certainly do go on some exciting rides in the summer (when we're not in swimming). We also skate, ski, sled and do piles of other things.

I am on a basketball, football and baseball team. They are more fun than anything. Mother says I am on too many and do too much but I love to. Guess I'll be an all-around athlete. I always manage to study my lessons somehow, tho.—Amy M. Myers, thirteen (X), Oneida Co., N. Y.

Won't you write again sometime and tell the Forum friends about the things you Scouts do together? Where do you go to camp in the summer? COUSIN RUTH.

Dear Cousin Ruth and Forum Friends:—We have fun with our cat and dog. When I go down in the cellar the cat follows. In the summer I milk one cow and I like to go swimming and some of my schoolmates come to my place to go swimming. We have fun. My home is right above the creek.

We are going to have an entertainment. I have three parts. We have not made arrangements yet when it will be. Our school is beautiful inside.—Gladys E. Miller, eleven, Lancaster County, Pa.

Dear Forum Friends:—I am very busy trapping. I caught a skunk which I did not know how to kill so I backed it in the hole and hit it on the head. Can hardly wait until morning to see what is in my traps. Skunks are getting scarce around here, therefore, I cannot catch very many. The rest of my time is spent coasting.

You should see my dogs, Dick and Bud, enjoy helping to coast. I am sleepy now and must go to my warm bed so that I can get up early for Sunday school in the morning. My class has six little boys and five girls in it.—Wilford Garland (X), Cambria Co., Pa.

Dear Cousin Ruth and Forum Friends:—We are going to have a literary program at our school January 22nd, and all the scholars are going to take part. I wish you could be there.

For pets I have a collie pup, his name is Jiggs, and a Shetland pony, his name is Prince. I am sending a recipe for popcorn balls. I hope Gladys Fuller will like.

HIS WINTER'S MEAL
Mary A. Musser, Centre County, Pa.

POPCORN BALLS"

- 1½ cups sugar or maple syrup,
- 1 tablespoon of butter,
- 3 tablespoons water,
- 3 quarts popcorn.

Boil sugar or syrup with butter and water until it spins a long thread; pour this on the popcorn and shape into balls.—Henrietta Grantham, thirteen, Mercer County, Pa.

Dear Cousin Ruth:—We have thirty head of registered Jersey cattle, two pair of horses and a lot of chickens. I have a dog and two kittens. I have a piano and ukulele and I can play both of them. Papa plays a violin and mamma the piano in an orchestra. I like to go to the dances. We have good times.—Ona Tyler, eleven, Potter County, Pa.

WHO WENT THERE!
Dorothy Clarke, Union County, Pa.

OUR LITTLE FOLKS PUZZLE CORNER

DEAR LITTLE FOLKS:—This week's puzzle contains a very personal message which I am hoping you will be able to find because I could not very well have it printed and sent privately to each one of you—and yet I'd like you all to have it. If you look carefully at the sentences below you will notice that in each case there is a letter missing. When you are sure what the letter is put it in the little heart space corresponding in number to the sentence. For instance, the letter missing from the first sentence is, of course "B" omitted from the word "February." Now find the others, write them in the little hearts and you will have this personal message. When you have found the answer, send it to me on a POSTAL CARD so that it reaches me by February 20th. BE SURE TO SAY HOW OLD YOU ARE. The ten children, sending in the correct answer, whose cards are the best in grammar, spelling, punctuation, penmanship and general appearance will each be awarded a set of pictures.

The Honor Prizes, bright and shiny pencils with a supply of leads, go to those Little Folks who send in correct, excellent answers to ten puzzles for ten straight weeks without missing,—one each week. Please remember that in order to win an Honor Prize your answers must be absolutely correct each week. Mistakes in spelling, punctuation, and failure to mention your age every time are only a few of the many errors that are made weekly.

Address all replies to the PUZZLE EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

The answer to the puzzle published in the January 23 issue of Pennsylvania Farmer is:

READING ACROSS

1. Abe
3. awe
6. no
8. ax
9. often
13. rag
15. cringed
18. he
19. ye
20. Eva
21. ten

READING DOWN

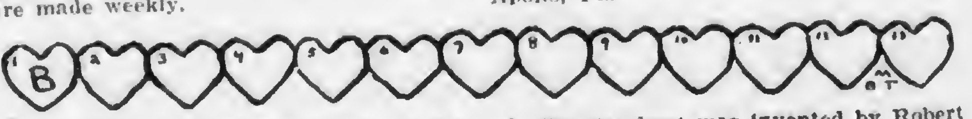
The puzzle prize winners are: A. Rodman Burgess, Jr., age 10, Franklinville, N. J.; Ada Eckel, age 12, Clarks Summit, Pa.; Kermit Green, age 12, Kunkletown, Pa.; Garson A. Lutz, age 12, Kempton, Pa.; Gertrude Slaseman, age 10, Cly, Pa.; Ruth Thompson, age 11, Newtown, Pa.; Edna M. Weaver, age 9, New Holland, Pa.; Gerald L. Weyand, age 12, Somerset, Pa.; Robert Worthington, age 10, Fountainville, Pa.; Ruth Young, age 10, Apollo, Pa.



1. Abraham Lincoln's birthday is Feruary 12th.
2. He was Presidnt during the Civil War.
3. Colubus discovered America.
4. Every ear has twelve months.
5. Calin Coolidge is President of the United States.
6. Pennsylvnia is called the "Keystone State."
7. Lafayette was a general in the Revoutionary War.
8. The stamboat was invented by Robert Fulton.
9. Washigton was called the "Father of His Country."
10. He was "first in the hears of his countrymen."
11. Daniel Boone was a great poneer.
12. There are ten tens in a hudred.
13. Longfellow wrot the poem "Hiawatha."

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1.—Archery, the newest craze at Ormand Beach, Florida, has lured many visitors. Here are two social leaders of New York's younger set displaying their skill.

2.—After three years aground, at the entrance of the Golden Gate, San Francisco, an attempt is being made to repair and refloat the Luman Stuart again.

3.—Miss Eleanor A. Lamson, one of the few women astronomers, is the official stargazer at the United States Naval Observatory in Washington.

4.—This statue of Lincoln, as the rail splitter, stands in the clanging, toiling, noisy west side of Chicago.

5.—Little Susan Johnson, six-year-old star skater of one of Chicago's skating clubs, has not only developed wonderful speed, but is also remarkably clever in doing stunts.

6.—This motorcycle, equipped with fire fighting apparatus suitable for a small town, was recently exhibited at a motorcycle show in New York.

7.—Three little animal friends of Annie E. Frary, who claims that all animals can be made to love each other.

The School Problem Again

After All, Shouldn't It Be Solved by the Parents?

OUTSIDE activities and the various school accessories, rather than regular school work are causing the many nervous breakdowns among school children. But the many rules and regulations with which the curriculum is hedged about do hamper the student, and make the work needlessly nerve racking.

Our school here is free from evils that use up the student's nerve force, but we have other non-essentials. When daughter was in seventh grade, she was not allowed to try regent's preliminary examinations from that grade, 'tho she was as capable of passing them then as she was the year following. She had to waste a half-year in eighth grade because of this technicality. Now she is forced to spend the full four years commonly allowed for high school work because "four years of English must be covered in class."

One of Two Things Will Happen

With such restrictions one of two things must happen: the child will daily along and form the habit of just putting in the time, or he will be graduated eventually with a number of surplus counts for which he has no use, and receives no special credit for having attained.

The system makes the flapper and is directly responsible for evils which arise from the flapper age. There is a constant cry for more good mothers, but the best of mothers are so handicapped as to be helpless in the midst of such a leveling system.—Mrs. E. M. Anderson.

The Parents' Part

SURELY nervous breakdowns among school children, and youth retarded because of rigid rules, are conditions much to be deplored. Now let us, as parents, face these problems squarely, and with a spirit of constructive rather than destructive criticism.

Child welfare organizations, and nerve clinics and hospitals trace extreme nervousness among our youth, not to the school room but to the four walls of the home—the child's home and its environment; with such direct causes as heredity, faulty diet, lack of rest, (involving late hours, irregular hours, and little or no night ventilation) and home atmospheres of turmoil and confusion.

Physical Deficiencies Play Big Part

Physical deficiencies—poor sight, diseased tonsils, defective hearing, decayed teeth, and weakness of vital organs—also play a large part in undermining nerve force of school children. For these defects the public school must not be blamed, and indeed so important a part do they play that progressive schools are aiding parents by conducting clinics to remedy the difficulties.

During many years of vital association with educators, schools, and school children in four alert states, we have rejoiced in the very flexible rules governing special promotions. Yet in spite of school surveys and various methods of research, which have helped the states inspire correct leadership among their youth, we do find here and there an educator who does not consider the "individual child." There may be several reasons for this condition—the most prevailing one perhaps being congestion in the school room. It is quite possible that a very exceptionally fine teacher laboring with fifty pupils for five hours daily, five days each week, might not so quickly recognize that unusual brilliancy of your child. You have grown up with him, and are with him about ten times as many hours each year.

Where the Blame Belongs

Just wherein lies our responsibility as parents? Must we not, after all, bear the entire blame? And if so, why? He is our child—ours from heritage—ours from early habits which so greatly govern his entire future, and the school he attends is ours also. So ask yourself where you stand.

1. Do you give the teacher your whole-hearted support?
2. Have you ever visited the school? (Not on special occasions alone—but did you ever observe the schoolwork for an entire session? Parents often think their children quite exceptional until they compare their efforts with several dozens of others under like circumstances.)
3. How often this year have you talked over with the teacher the work and health of your child?
4. Is it your great concern to follow up the advancement of your child each month?
5. Do you always attend the parent-teacher meetings?
6. Are you alert on the ideals of your board of education?
7. As parents, do you interest yourselves in bettering school conditions in your community?
8. The public schools are among our oldest and most sacred institutions. Have you safeguarded this trust?

Nothing thrills a conscientious parent more, than the happy groups of healthy children going to and fro with school books. Here they are joyously mingling with others and learning to live. Have you ever thought of the schools as your property? They are yours—and the teachers, principals, supervisors, and superintendents are your servants—thru that school board which you elect. After all then it must follow that your own school is just what you make it, or allow it to become. Can your child waste a year of life in the school you provide for him?—G. S. Stewart.

A Quicker Way

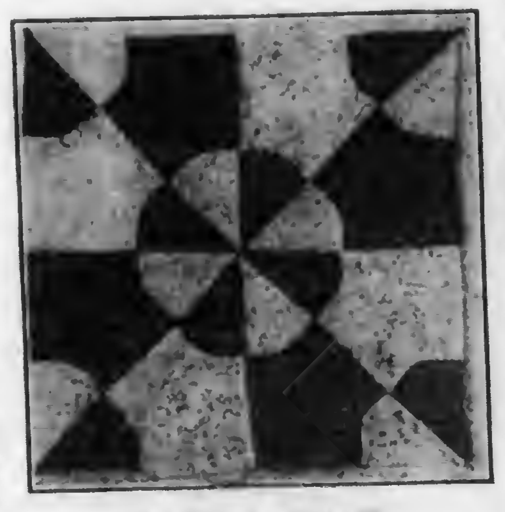
HERE is a much quicker way to make comforters than the old way. First, put an old sheet down on the floor and spread the lining on it. Put the cotton on the lining, take smooth sticks about a yard long and whip the cotton until it becomes very light. Put the top on and tack in rows about three inches apart, taking two rows at a time. Tack up and down from one row to the other, but do not cut the threads until you get the entire comforter tacked.

You can then take it on your lap, cut the threads, tie and trim them all while sitting down. By doing this you can make one in the time it takes to card the bats by the old way. You can tack one in about two and one-half hours, do the rest while sitting down, and not have to break your back over the quilting frame.—Mrs. C. A. U.

Old Patchwork Quilts

Patterns—New and Old—for the Needlewoman

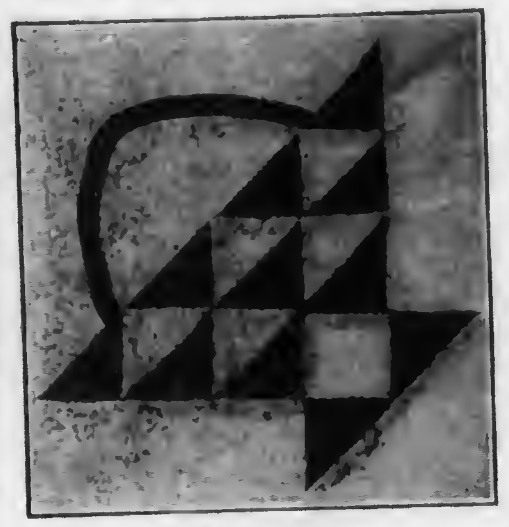
EACH year there is a growing interest in the old patchwork quilts and there are parts of each state where the interest has never waned—where the women with a creative spirit have always wanted to make "just one more quilt" even tho their closets and chests are full to bulging.



The Dutch windmill.

Can you think of anything more interesting than a visit to the home of some dear little woman who has about her, all the treasures of so many years? With each bit of needlework she can tell a story that makes one feel they have missed something by not having lived nearly a century ago.

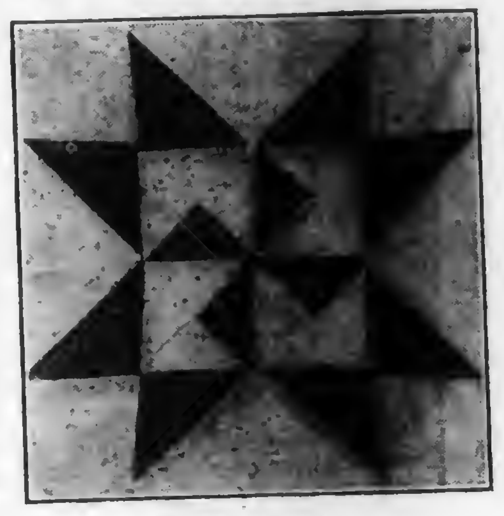
The woman who has fallen heir to one or more of these old treasures is indeed fortunate but those who have not, need not be disheartened for with the reproduction of the quaint little chintz patterns which can be procured from the wash goods departments in our city stores and even the smaller towns, the old patchwork patterns can be reproduced.



Basket pattern.

We have the advantage over our grandmothers in that we have more materials and softer and more varied shades than they had to choose from.

There is not an old quilter who is not familiar with the basket pattern for it was a general favorite as well as the star designs, which are many. The Dutch Windmill, joined solid, makes a continuous pattern and takes simple marking or one could almost follow the seams and not have to mark for the quilting.—Carlie Sexton.



Octagonal star.

Editors' Note:—Anyone desiring information as to patterns, send your requests to the Household Editor, enclosing a stamped envelope for reply.

Start a Health Chart

A LARGE life insurance company has worked out a splendid health chart which I have known to be of untold value with children whose habits hitherto had been not of the best. It is a very good check-up on mothers, too. It not only aids mothers in providing what's best for the growing child, but spurs her to better habits herself, for who has a boy or girl that does not imitate?

The chart has the following twenty essentials, each one adding five per cent to the personal health record. How do you measure up?

1. I brush my teeth every morning.
2. I eat cooked cereal for breakfast.
3. I do not drink tea nor coffee.
4. I eat fresh fruit or prunes every day.
5. I drink several glasses of water daily.
6. I do not drink from another person's glass.
7. I sit and walk erect.
8. I never put a pencil in my mouth.
9. I stand straight with my chest up.
10. I wash my hands before eating.
11. I drink at least two glasses of milk daily.
12. I eat plenty of vegetables every day.
13. I chew my food well.
14. I play out-of-doors every day.
15. I do not eat much candy.
16. I am cheerful and happy.
17. I take a complete bath at least twice a week.
18. I brush my teeth before retiring.
19. I go to bed early.
20. I sleep with windows open.

Hang these Good Health Rules in a conspicuous place in your kitchen, where "He who runs may read."—G. S. Stewart.

Valentines

OUR children have spent many happy evenings making their own valentines. At the small cost of fifteen cents we purchased from a large mail order house materials to make fifteen nice valentines, and envelopes for the various shapes and sizes were included. I heartily recommend this plan to all mothers for the children have enjoyed it far more than previous years when we bought them ready to mail.—Mrs. E. M. C.

Trouble with Macaroons

And Suggestions to Assure Success Next Time

DEAR EDITOR:—During the holiday season I tried one of the Pennsylvania Farmer recipes, and my macaroons were as flat as pancakes. We could eat them, but the appearance left everything to be desired. The recipe called for ¾ pound sugar, whites of three eggs, and ½ pound almonds.

I baked them at 325-350 degrees. Was that too low or too high? I used "put up" eggs. Could that have anything to do with my failure? Or did I have my nuts too coarse? I put them thru the food chopper. Thank you for an answer on Our Page.—A Reader.

MACAROON SUCCESS

The above recipe is all right, and the temperature, too, is O. K. Nuts should be ground in the medium knife grinder. I do not doubt in the least that your failure was due to the eggs. Eggs are such a vital part of macaroon baking that I should never attempt them without fresh eggs, just as no one would try angel food or omelet without fresh eggs.

Here are just a few valuable rules to bear in mind when baking macaroons of any kind:

Use fresh eggs beaten very stiff and dry.

Add sugar gradually, beating stiff with each addition.

Give them plenty of room.

Bake slowly, ten to fifteen minutes, in moderate oven.

Bake on tin that has been carefully paraffined.

CHOCOLATE MACAROONS

2 egg whites beaten very stiff
1 measuring cup granulated sugar
2 squares grated baker's chocolate

Follow rules combining eggs and sugar, then fold in the grated chocolate. Bake fourteen minutes. Remove from tin with spatula or cake turner. This makes thirty-six cakes. —Betsey Ford.

A Dry Shampoo

THE hair needs special attention during the winter when there is so much dirt and smoke. The shampoo business is much simplified when one has bobbed hair, but there are still a few of us who have long hair. Drying hair is often so difficult in January and February that country women sometimes postpone washing their hair. A hairdresser friend of mine told me how they give a dry shampoo in the beauty parlors. I tried it out, so I know that it works.

First wash your brush thoroly, and when it is dry, push cotton into the bristles and brush your hair. When one filling of cotton becomes soiled, take it out and put in clean cotton. Keep up this process until the cotton stays white. You will be amazed to see how much black one gets this way, and how glossy the hair becomes.—May H. Mumaw.

QUINCE HONEY

1 cup sugar
1 cup water
1 quince
½ sour apple

Let the syrup come to a boil then add the quince and apple which have been grated. Rapid boiling will prevent it from turning red.

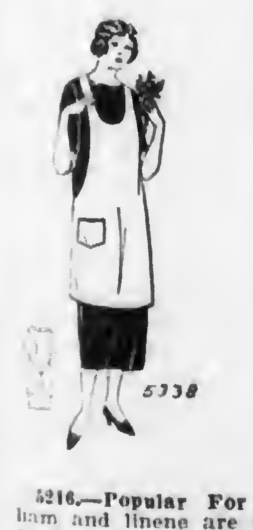
I also use about half and half of sweet apples and quinces for canning. The apples will have the quince flavor and they go farther. Quinces are often hard to get and sometimes high in price.—Mrs. C. M. F.

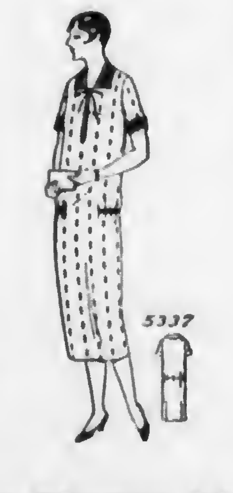
When Sewing for the Kiddies

Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

5338.—A Simple Apron Style.—Sateen, unbleached muslin, drill, cretonne or linen may be used for this style. One size: Medium. It will require 1⅝ yard of 36-inch material. Pattern, 10 cents.

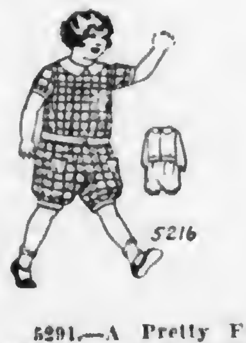
5337.—A "Slip-over" Model.—Cotton or wool crepe or rep, gingham, percale or tub silk would be suitable for this design. Seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. To make the dress as illustrated will require 3¾ yards of one material and ½ yard of another material to face collar, cuffs, vestee and belt for a 38-inch size. The width of the dress at the lower edge is 1⅝ yard. Pattern, 10 cents.

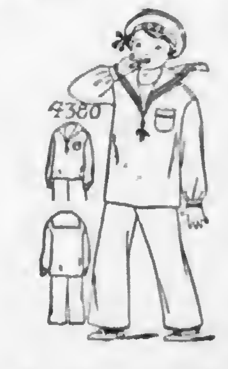




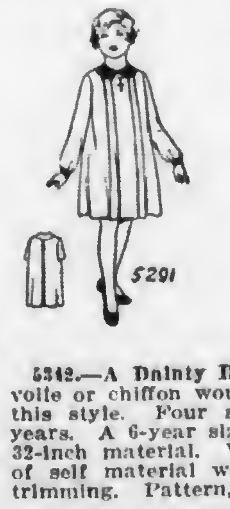
5216.—Popular For Play.—Plaid gingham and linene are here combined. The rompers may be finished with long or short sleeves. Four sizes: 2, 4, 6 and 8 years. A 4-year size requires 2⅜ yards of 36-inch material if made with long sleeves. To trim with contrasting material requires ⅜ yard. If made with short sleeves the rompers require 2⅛ yards. Pattern, 10 cents.

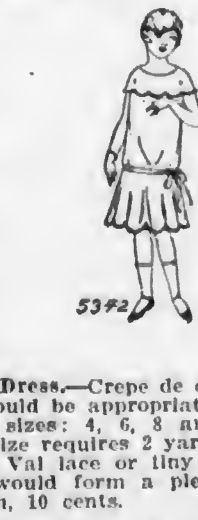
4380.—For the Small Boy.—Linen, drill, flannel and serge, also pongee and jersey cloth would be attractive for this style. The blouse may be finished in smock style or with the lower edge drawn in bloused effect. Four sizes: 4, 6, 8 and 10 years. A six-year size requires 2⅜ yards of 40-inch material. Blue linen with white facings would be pleasing, or white drill with trimming of orange or green. Pattern, 10 cents.





5291.—A Pretty Frock.—Linen, jersey, wool rep or wool crepe would be good for this model. Four sizes: 4, 6, 8 and 10 years. A 6-year size requires 2¼ yards of 36-inch material if made of one material and with long sleeves. If made with short sleeves 2⅛ yards will be required. Collar and cuffs of contrasting material require ¼ yard. Pattern, 10 cents.





5342.—A Dainty Dress.—Crepe de chine, voile or chiffon would be appropriate for this style. Four sizes: 4, 6, 8 and 10 years. A 6-year size requires 2 yards of 32-inch material. Val lace or tiny frills of self material would form a pleasing trimming. Pattern, 10 cents.

Send 10c in silver or stamps for our up-to-date spring and summer 1926 Book of Fashions.

DAVIS ABSOLUTELY PURE BAKING POWDER
DAVIS BAKING POWDER

Aren't these cookie cutters funny?
A cat, a horse, a goose, a bunny!
—*and there's a set for YOU!*

. . . and how the children will love the cookies you'll make with them!

They're easy to get . . . the set of four will cost you nothing but the packing and mailing cost—15c. We'll gladly send a Davis Cook Book, free, with the cutters, too.

We are making this gift to introduce to you some of the many treats which can be made with Davis Baking Powder. Davis makes baking lighter, finer in texture and more easily digestible. And—most important—it is more economical because it costs you less and you use no more than of any other high grade baking powder.

Mail the Coupon Today!

DAVIS
BAKING POWDER

Only one set of these cookie cutters to a family. This offer expires April 1, 1926.

DAVIS BAKING POWDER CO.

Use Only Genuine Coleman Mantles

They Give Better Light and Last Longer

1 They are made especially for use on Coleman Quick-Lite Lamps and Lanterns. They work perfectly with the Quick-Lite gas tip and air intake in producing the wonderful Quick-Lite brilliance.
2 They are full size, correctly shaped, knit to proper mesh, saturated with purest chemicals by special Coleman Process, thus insuring plenty of clear, natural, steady light.
3 Coleman Mantles are made of long-fibre Egyptian cotton and have reinforced patented bottoms, giving double strength where gas pressure is greatest.
4 Most economical to use. Coleman Mantles actually pay for themselves because they last longer.
5 *Use only the genuine.* Look for the name "Coleman" on the mantles you buy. Get them by the box — 12 to the package.

If your dealer cannot supply you order direct. Price 10¢ each; $1.00 per dozen, postpaid.

BROWN'S NEW BARGAIN BOOK on Fencing, Barb Wire, Gates, Steel Posts, Paints and Roofing
I Pay the Freight

FREE Don't Buy Fencing Till You Get My Book

Bigger, Better Values Than Ever This Season

You'll be glad you sent for my New Big Bargain Book when you see how I have slashed prices and the big savings I am giving my customers this year. Don't buy a rod of fence, or roll of roofing, or can of paint, until you get my new catalog—over 100 pages of real bargains on

Fence, Gates, Barb Wire, Steel Posts, Roofing, Paint

For years I have been saving money for my million customers—this year I'll save them even more. Just read these letters:

"Received my fencing and gates. I figure I *saved* $60.00 on prices here by ordering from you." N. LEGGETT, Boulder, Colo.

"I bought fence of you four years ago and it is fine and bright yet. I saved about $15.00 on this order." I. G. STEWART, Harlan, Iowa

When you buy from Jim Brown you get Direct-From-Factory prices—no in-between profits added; this extra saving is kept right in your own pocket. Furthermore Jim Brown pays the freight and I ship from 3 big factories at Cleveland, Ohio, Adrian, Mich., Memphis, Tenn., also from warehouses at Kansas City, Mo., and Davenport, Iowa. The low Direct-From-Factory prices are all you pay — not one extra cent is added — Jim Brown gives you REAL Factory prices and satisfaction guaranteed. Write and get my Bargain Book NOW.

FAMOUS **Ohio** SPREADERS

Save Money-"Gold Bond" Plan

It is only by this unusual plan that we are able to offer such a high grade manure spreader at so attractive a price.

Remember that all Famous Ohio Spreaders are built upon a steel chassis—with box reinforced by steel bottom sill—with steel beaters and wide-spread. The new automobile type axle prevents pole whipping and undue strain upon the running gear.

Every dollar's worth of extra value put into this machine will be returned in increased sales. We have not increased the selling price one cent.

The earlier you buy, the more you can save by the "Gold Bond" offer. Ask your dealer at once for all particulars—if he cannot tell you about it, send his name to us.

Those Puzzling Report Cards

And the Games Father and Mother Devised

MR. AND MRS. WILSON were in conference. Two report cards lay on the table beside them—Alice's and John's—and it was these the parents had been discussing.

"Alice's spelling!" almost groaned Mrs. Wilson. "And John's grade isn't much better. We have been helping them with their home work, too."

"Something ought to be done," answered her husband. "Seems to me their language needs bolstering up, too."

"I wonder," mused Mrs. Wilson, "how we'll manage to change the situation? I know Miss Martz is a capable teacher."

The two thought and thought. And before long, a nightly "game" of some sort was in progress in the Wilson living room. And the results soon became apparent, not only in better grades, but in improved oral expression, and a more general mental alertness. Here are two games that proved most popular and helpful. The first they called "Last Letter."

How to Play "Last Letter"

One player begins the game by spelling a word—any word, short or long. The second player must at once spell another word, beginning with the last letter of the word just spelled. The third player spells a word beginning with the last letter of this word, etc. If any player spells a word that has been spelled before, he must pay a forfeit.

This may easily be turned into an interesting geography game by pronouncing instead of spelling the names of lakes, rivers, cities, countries, and other geographical terms, each beginning with the last letter of the one preceding it. If liked, the players may be required to locate their "names."

The Wilsons found that a certain "Conversation Game" was much enjoyed at meal times. Instead of devoting all their time to gulping their food, the children soon learned to take pride in their ability to add something of worth to the general conversation. Of course, they weren't told that they were being helped to build a "language foundation." That would have destroyed the purpose of the game.

One time, Father Wilson would begin the game, choosing his own subject, an easy one, to be sure, suited to small folks.

"I think I never saw larger snowflakes than those that fell today," he would say. John knew it was his turn next.

"The snowflakes build themselves into little white tents on all the fence posts," he announced eagerly.

"Miss Martz says there never was a snowflake that wasn't six-pointed." was small Alice's contribution.

"I think God must be a very wonderful artist to design so many different snowflakes and all of them six-pointed," added Mother.

Then Alice chose her subject and the others had to say something about it. John took his turn, too, and so did Mother.

Interesting? Well, maybe not always to grown-ups whose minds have weightier subjects to ponder, but these, and countless other simple games, are far more effective and certainly pleasanter than nagging and worrying over monotonous home work, and poor "marks."—Helen Metzger.

Flowers in Winter

TRY this: take a nice fat carrot, cut it across so that the upper section measures about three inches. Carefully dig out a portion of the pulp, not breaking the sides nor injuring the top, then put a strong string thru the cupped end, and hang in your sunny kitchen window. Keep that cup filled with water, and you will very soon be delighted with a unique green basket, for the carrot tops will grow out and curve delightfully over the orange sides.

My pet hotbed. With a saw convert a small wooden box into a sloping-sided box, and by using wide adhesive tape fasten on a glass top. You can make most any shape or size hotbed for your indoor seedlings by following this suggestion.—Pennsylvania Reader.

Plan for Variety in the Menu

Are You Robbing the Family at Breakfast?

WOMEN will talk shop, whether they follow teaching, millinery, or are farm mothers. At a recent gathering of mothers, the conversation reached a point in which you and I are greatly concerned—"variety in the menu." One woman cornered me later and asked me how in the world to vary the breakfasts.

With me that is no difficulty, for the two essentials, fruit and cooked cereals, are so rich in variety. Most country cupboards have at least a change of fruits for each day in the week. Then with prunes, good wholesome prunes, and delicious oranges for diversion—what more could one wish? Cereals, too, that is those for cooking, offer a fine variety.

This woman says she cannot afford to put fruit on the breakfast table—that they have toast and rolled oats from January thru December. Let me tell you what I told her. "At our house we cannot afford to have a single breakfast without fruit, and I doubt if any one can." It is such a splendid regulator.

My neighbor has a child in school and his doctor bill last winter was $79, spent mostly for office calls when he had terrible colds. She admitted to me that the very first thing the doctor always asked was concerning his body "elimination." She never sends him to bed without a dose for this purpose. But now she is thinking. Would $79 furnish her table with fruit supreme? We know it would. And your child might have the added happiness that accompanies health.

Is there fruit on your breakfast table? Or are you one of those mothers who is robbing herself and her family as well?—Gertrude S. Stewart.

Pork Brine

THIS pork brine has been used for thirty years or more by Crawford County neighbors:

To every gallon of water use:
1½ pound salt
¼ ounce baking soda
⅛ ounce saltpeter
½ pound brown sugar

BEEF BRINE

To every 100 pounds of beef use:
3½ pounds salt
¼ ounce saltpetre
½ pound brown sugar

Boil in water enough to cover meat well. When it boils skim and pour on meat hot.—Mrs. D. W. Miller.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N.Y., discovered a process of making a new kind of paint without the use of oil. He named it Powdrpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to A. L. Rice, Inc., Manufacturers, 114 North St., Adams, N. Y., and a trial package will be mailed to you free, also color card and full information showing you how you can save a good many dollars. Write today.

400-Club Members

FARMERS on thirty-nine Pennsylvania farms qualified for membership in the 1925 Keystone 400 Bushel Potato Club by growing more than 400 bushels on a measured acre. The names of this new potato growers' roll of honor have just been announced by the founder of the 400 Bushel Club, E. L. Nixon, extension plant pathologist of the Pennsylvania State College.

Growing the largest yield in the state, 571.4 bushels, R. E. Briggs and Son, Nescopeck, qualified for the club for the fourth time. Ray Briggs thus becomes president of the club because of growing the best yield. W. B. Bennett, Ulysses, had the second highest yield, 529 bushels, and so becomes vice president. The grower of the smallest yield, C. A. Wachsmuth, Butler, is the new secretary. His yield was 401 bushels.

For the first time in the history of the club women became members in 1925. Mrs. Harrison Hamm, Carbon County, grew 428.8 bushels, and the Misses Snavely, Lebanon County, raised 406.5 bushels on a measured acre.

The roll of members by counties and the number of bushels grown on an acre by each follows:

Berks County: Paul R. and John R. Guldin, 482.18; John DeLong and Son, 455.2; Stanley I. Behm, 423.7.

Bucks County: Harvey H. Baum, 422; Henry R. Bauman, 408.7.

Butler County: Thomas Denniston and Sons, 441.18; C. A. Wachsmuth, 401.

Cambria County: W. A. Westrick, 403; C. H. Hostetler, 402.

Carbon County: Mrs. Harrison Hamm, 428.8; Robert Getz, 426.6; J. B. Adams, 406.6.

Chester County: R. Darlington, 436.

Columbia County: G. H. Dippe, 409.

Huntingdon County: Robert J. Wigton, 402.6.

Lebanon County: Misses Snavely, 406.5.

Lehigh County: D. D. Fritch, 452.4; Reuben Ringer, 430.3; Alvin J. Snyder, 424.8.

Luzerne County: R. E. Briggs and Son, 571.4; H. F. Coon and Son, 514.25; Charles F. Johnson, 440; Edwin C. Seely, 421.

Lycoming County: Elmer J. Waltz, 414.7.

Mercer County: R. P. McDowell and Sons, 409.2.

Montgomery County: Jacob S. Wile, 517.1.

Northampton County: Omar Dietterich, 408.

Perry County: Charles E. Beaver, 452.4.

Potter County: W. B. Bennett, 529; M. L. Van Wegen, 462; Alonza Perkins, 444.6; E. L. Sherman, 420; E. L. Blass, 405.

Somerset County: C. E. Rennan, 481.9; Claude Bauermaster, 473.5; Edison M. Hay, 410.

Sullivan County: Kemerly Connor, 431.

Union County: Harold K. Benner, 407.

Wayne County: Richard B. Simons, 404.

Buy It in Pennsylvania

FEW people realize that all nursery stock sold by Pennsylvania nurserymen is annually inspected by the nursery inspection service of the State Department of Agriculture. These inspections are made to ascertain the presence of any injurious insects or diseases and every effort is made to insure the cleanliness and freedom from these pests before certificates are issued to the nurserymen. Infested or infected stock must be cleaned up before a certificate is issued and each shipment made by the nurseryman must bear a copy of this certificate.

Invest Your Surplus Funds

WHERE the principal will be safe and the interest promptly paid twice yearly. Buy Bonds that are issued under U. S. Government supervision by the world's largest mutual farm mortgage banking system. The entire proceeds are used to build up the farming business through loans to active farmers at reasonable rates.

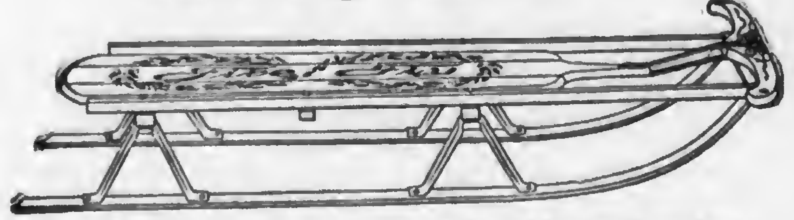
Fire-Fly Coaster



Length, 36 inches; Height, 6 inches; Width, 12 inches; Weight, 7 pounds.

Boys and girls, here is your chance to get a Fire-Fly Coaster. Just a little pleasant work after school hours and the sled is yours.

HERE'S HOW

Call on a few of your neighbors and get them to subscribe to Pennsylvania Farmer for one year at $1.00 each. Three subscriptions is all that is required. Send us the three subscriptions together with $3.00, the amount collected, and the sled will be forwarded by prepaid parcel post.

Fire-Fly Coasters need no advertisement; you know what they are. So get busy and earn a sled before another snowfall. Send all orders to

PENNSYLVANIA FARMER,
261 South Third Street, Philadelphia, Pa.

Who tests your tubes?

THE same great research laboratories that developed the Mazda lamp have developed the Radiotron. The five great factories that manufacture the Mazda lamp, manufacture the Radiotron. And the same genius and the same scrupulous accuracy are behind the test methods developed for the RCA test laboratories.

A Radiotron is far more difficult to make than an electric lamp. To insure the high standards of uniform perfection that have made famous the names of RCA, General Electric and Westinghouse, the RCA laboratories have developed tests delicately exact. When you buy a vacuum tube—know who made and tested it. Look for the RCA mark and the name Radiotron on the base.

RADIOTRON UV-199 is the standard tube for dry battery sets.

RADIOTRON UX-199 is *exactly* like it, but has a new base.

RADIO DEPARTMENT

Conducted by
BRAINARD FOOTE

Use of Trick Dials

FORMERLY, the tuning dial of a radio set was very much crowded toward the lower end of the scale. Stations are spaced by the Department of Commerce according to frequency and not wavelength. A uniform separation by frequency is necessary in order that stations may not conflict and cause interference. On the ordinary tuning condenser, a movement of a certain frequency near 250 meters may be accomplished by moving the dial one-half of a degree, whereas the same change of frequency near 450 meters may take two degrees. Naturally, stations appear closer together near the low numbers.

Special straight-line-frequency condensers are now being made which overcome such crowding and space the stations evenly over the semi-circular scale of the dial (180 degrees). The plates of such a condenser are usually eccentric in shape so that unless the bearings have a great deal of friction the plates are likely to move of their own weight. The use of a wood vernier dial will prevent this.

Special vernier dials may now be purchased which, by means of special cams and internal gearing, adapt regular tuning condensers to the frequency-spaced dial, thus overcoming the necessity for eccentrically shaped plates. Such dials, in addition, usually employ the entire circle of 360 degrees, just doubling the available room on the dial scale for noting the dial numbers of stations. With dials of this sort tuning is incomparably easier and more successful.—B. F.

Lessening the Resistance

DID you ever notice that as your B batteries became older your radio frequency tubes were harder to control and that a howl sometimes started in the amplifier? Such a condition is caused by increasing resistance in the B batteries as much as by actual loss in voltage.

Even when brand new, B batteries offer resistance to some extent. This may seem peculiar, on account of the fact that the batteries themselves furnish the current, but it is true, nevertheless, that the connecting wires, joints and chemicals in the B battery combine to offer resistance to the current flow.

Energy set up by the radio and audio tubes should be kept out of the B battery to avoid distortion from allowing energy from different tubes to flow in the same source and thereby affect each other.

To do this, secure a fixed condenser of large capacity and connect it from the B plus ninety post to the B minus post. Suitable condensers are made up in small sizes, to stand a maximum of 250 volts or more and should have a capacity of one or two mfds. The cost is slight and the improvement in results, particularly after the B batteries are half used up, is usually very pronounced.—B. F.

Battery Chargers

MOST listeners use storage batteries for lighting their radio tubes. Charging the storage battery is always a problem, a nuisance and often an expense. Those who can afford it have two batteries and engage the service man to replace and recharge at definite intervals, to insure untroubled and constant operation of their sets.

Charging at home is very economical—five to fifteen cents worth of current will charge the battery. The vibrator type of charger is the cheapest, but requires adjustment now and then and the replacement of silvered contacts. Moreover, some object to it on account of its buzzing noise. The alkaline type of charger is silent and the chemicals need renewal very often. Usually, the charging rate of such a charger is rather low, so that it takes longer to complete the charge.

The tube type of charger is silent also, but requires a new tube now and then. Tube chargers are the most expensive, but usually the most reliable. Of late, a new type of charger has come out. This is called the trickle charger and is so named because it charges very slowly—allowing the current to trickle thru the battery. Both tube and alkaline trickle chargers are made.

The trickle charger may be left connected all the time—a hydrometer reading once a week or so is sufficient to note whether the charger is being left on too much or not enough. Combination storage batteries and trickle chargers with master switches are now available and solve the tube lighting problem perfectly.—B. F.

Placement of the Aerial

SOME listeners seem to believe that the placement of the aerial wire exerts a marked effect upon the direction from which reception is best. While it is true that this has some bearing on the results, it is not nearly so noticeable as is imagined.

First decide in which direction most of the stations that you want to hear are situated and then run the aerial wire in just the opposite direction if convenient. In other words, if the stations lie south, point the aerial north. The wire should be in line with the desired direction, with the lead-in towards it.—B. F.

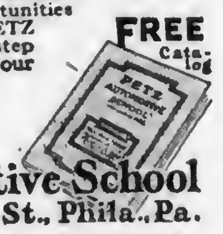
Bunk and Truth

THESE ARE "BUNK"

1. That the aerial wire must be nicely cleaned with sandpaper to receive radio energy. That the wire must be bright and shiny.
2. That insulated wire is not as good as bare wire for an aerial.
3. That the lead-in must be of insulated wire.
4. That "interference can absolutely be elminated" when two stations are so close in wave length as to cause a whistle in the set.
5. That an indoor aerial is superior to one outside and higher up.
6. That a five-tube set must necessarily be better in long distance than a three-tube set, regardless of its construction.

BUT THESE ARE TRUE

1. That dirty aerial insulators must be cleaned thoroly to receive best from long distances.
2. That any joints in the aerial system should be soldered firmly. That it is even better—not to have any joints—but to use one wire from the far end of the aerial all the way to the set.
3. That an indoor aerial often receives local programs with less interference from static and other causes than an outside aerial.
4. That a five-tube set, properly constructed, is more sensitive and selective than a three-tube set, and hence costs considerably more.
5. That it is impossible to reduce interference from static without also reducing the volume of the reception. However, it is often better to use a smaller aerial and tune more carefully for a strong station, thereby getting rid of a good deal of static and electric interference.—B. F.



Big Pay Jobs

THE auto tractor and electrical business offers untold opportunities to the trained mechanic. The automotive industry NEEDS TRAINED MEN and there are thousands of chances to start a business of your own.

NEW INVENTION SAVES MILLION

A Lamp that Burns 94% Air.

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, J. O. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

"Natural Mixtures"

"NATURAL mixtures" are sometimes alluringly advertised in catalogs, papers and magazines. Experiment station and seedhouse investigation find that for the most part they are "natural sweepings." They are advertised as the result of seed growing together, and thereby mixed when threshed and cannot be separated. The modern seed-cleaning machinery gives the lie to most such claims.

Investigation of "natural mixtures" in New York brought this verdict from the state authorities:

"The results of these tests, supplemented by many others, seem to be convincing evidence that these so-called 'natural mixtures' are not, in a majority of cases, natural mixtures at all.

"They never grew together, but are simply low-grade seed, screenings, tailings, and overrun and underrun from cleaning mills bulked together. They contain all kinds of weed seeds, as their analysis will show, for when a sample from one of these mixtures is analyzed it may show weed seeds distinctly typical and characteristic of two or more producing sections of the United States.

Buy from Responsible Seedsmen

"Certainly both economy and satisfaction demand that the seed used be purchased separately and mixed at home in definite proportions, according to the recommendations made by investigators who have studied the situation. To buy a mixture of grass seed or to send away for such gives one no control over the weeds introduced upon the farm and simply gives an unscrupulous seedsman a chance to get rid of some worthless seed."

Beware of "natural mixtures."

Seedsmen make mixtures of grass seed upon request, and have standard mixtures for various purposes, the proportions fixed according to the formula of scientists who have investigated.

They are not "natural mixtures," but are artificial and scientific mixtures, and made up of the highest grade seed of each ingredient as free from weed seed as modern machinery can make it.

Special cut-rate bargain mixtures contain a lot of this "natural" stuff The New York station cites the tests of the mixtures sent out by two bargain seed concerns against which "cease and desist" orders were issued by the Federal Trade Commission in 1920 and 1921.

An analysis of some samples from these firms showed ninety-one different species of weed seeds.

"There were present," says the New York report, "weed seeds, which, according to best information, were typical of the flora of all seed producing sections of the United States, indicating rather conclusively that this material was mainly seed screenings, low grade seed, and tailings from various sources bulked or mixed together."

Agricultural Progress

(Continued from page 3)

order can be secured by writing to the Pennsylvania Public Service Commission, Harrisburg.

With this step forward in rural electrification, coupled with all the other advancements made during recent years in our agriculture, one can be hardly other than optimistic over the future. The economic and social conditions surrounding the farmers of Pennsylvania today are such, in contrast to those of the West, that I believe if Horace Greeley were living now, his advice would be, "Stay East, young man, stay East."

PAPEC
"The Cutter That Does Not Clog"

"THE Cutter never clogged and we had no trouble with it whatsoever," writes P. C. Petersen, Johnston, R. I., after two years' use of a Papec Cutter. The Feeding mechanism has been so perfected that a man is no longer needed at the feeding table, saving the wages of one man, and doing a better job.

Needs Less Power—Lasts Longer

Any good two-plow tractor will run an N-13 or L-16 Papec Cutter to capacity without danger of clogging. Where there is no tractor, the R-10 Papec can be used with any farm gasoline engine developing 3 h.p. or more. The Papec lasts a great many years with very little upkeep cost. J. B. Johnson, Southboro, Mass., bought his Papec Cutter in 1917, cut from 25 to 30 acres of corn every year, also lots of hay and straw for bedding and after eight years writes: "To date have not spent one cent for repairs."

Write for FREE Catalog

It shows why the Papec has won the praise of men who know machinery. It demonstrates that a Papec will pay for itself in one or two seasons under favorable conditions.

Potato

plants tell of their hunger with these symptoms—

YOU may eat three hearty meals a day but if your food is unbalanced you know what happens.

A potato plant suffers in a similar way. Its food must be properly balanced . . . it must have nitrogen, phosphoric acid, and potash in correct proportions.

If nitrogen is lacking the leaves turn yellow and the vines lack vigor. Insufficient phosphoric acid delays maturity.

You first notice signs of potash hunger in the foliage. The leaves develop a bronzed and yellow color; later the leaflets hang limp . . the vines wilt.

Fields demonstrations have shown that complete fertilizers containing 80 to 100 lbs. of actual potash per acre bring good returns.

On this basis at least 1000 lbs. per acre of a high analysis complete fertilizer containing 8 to 10% potash, or 2000 lbs. per acre if the potash content is 5%, are required for profitable returns. Many successful growers prefer sulfate of potash in their mixtures!

FREE. Potato growers interested in larger yields per acre will find useful information in the newly revised booklet "Better Potatoes." If you would like to receive a copy just send your name and address to the office below.

30 *extra bushels per acre*

On one plot of clay loam soil, Mr. W. L. Shank, Lancaster County, used a mixture containing 3% nitrogen and 8% phosphoric acid at the rate of 1000 lbs. per acre. The yield was 17.5 bushels of marketable potatoes *more* than where no fertilizer was used. But an adjoining plot gave better results:

This plot was fertilized as above, but with 10% potash in the fertilizer—equal to 100 lbs. of potash per acre. The yield increased to 47.5 bushels of marketable potatoes over the check plot.

The potash fertilizer produced 30 bushels more than the no-potash mixture. Potash Pays!

Doctor Lipman's Weekly Talk on Soil Fertility Problems

The Way Commercial Fertilizer Is Used in Europe

AN UNDERSTANDING of the fertilizer practices in Europe is not possible without a knowledge of the general farming practices followed in European countries. It would be well to remember, in the first place, that the average European farm is much smaller than the average American farm. In France there are more than five million farms of less than ten acres. In some of the other European countries the situation in respect to the size of farms is not much better. Because of the small holdings, much of the work is done by hand. Relatively little machinery is used, and the application of fertilizer by hand is not regarded as a serious matter, for labor is cheap and many of the European farmers have been taught to do almost everything by hand.

Another factor that influences the purchase and use of commercial fertilizer in Europe is the question of credit. In Germany, the Netherlands, the Scandinavian countries, and even in France and Italy, powerful farmers' organizations have arisen. These depend on their collective ability to borrow money for financing farm operations. The cooperatives, or syndicates as they are called, determine the fertilizer needs of their members and purchase the raw materials in accordance with the prevailing prices and economies that may be made in buying plant food at the lowest cost.

Contrast in Practices

The above facts will help the reader to understand more clearly the information recently gathered by the writer thru some of his friends at the European experiment stations. These letters show a very considerable contrast in the practices of different countries. For instance, Prof. Christensen, of the Lyngby Experiment Station in Denmark, states that "chemical fertilizers in mixed form are, practically speaking, not used here in Denmark, and as far as I know the same is the case in the other Scandinavian countries." Dr. Knuttel, director of the Royal Agricultural Experiment Station at Maastricht, Holland, writes: "In the Netherlands compound chemical fertilizers have within recent years been used to a limited extent only. This station advises against the purchase of mixed fertilizers, among other reasons, because they are too dear in comparison with fertilizer ingredients. The importation of mixed fertilizers from foreign countries is insignificant."

Sir John Russell, director of the Rothamsted Experimental Station at Harpenden, England, writes:

The Compound Fertilizer

"Farmers in this country purchase considerable quantities of fertilizers in the form of these so-called compounds, and they do this in spite of a great amount of advice to the contrary given them by the county instructors. I attribute this preference to two causes. In the first place many of them mistrust their knowledge of artificials; they are not quite sure about the various materials and they cannot afford to take risks. Those who are more adventurous or had more knowledge tried mixing at home, urged by the circumstances that the price of the separate components was less than that of the mixture. They had, however, the greatest difficulty in making an efficient mixture and the results were not always satisfactory. I was informed by the manufacturers that there is now less tendency than a few years ago to develop home mixing.

"At the same time the activity of the county instructors has stimulated the artificial manure manufacturers to improve their methods and their formulae so that the farmer has gained. The making of a good mixture is very difficult on a farm where there is no mill or proper mixing apparatus, and in my view the best scheme would be for the farmers to draw up their own recipes on the basis of their knowledge of their own soil and its requirements, and send them to the manufacturers to be made up. We are a long way from that yet, but I think it is the goal at which we should aim."

Single Ingredients Preferred

A letter from one of the officials of the International Institute of Agriculture at Rome, Italy, is also of interest in this connection. According to him:

"While the greatest proportion of chemical fertilizers used in the United States represents mixtures, the preference is given in Europe to single ingredients, owing to difficulties in the prevention of adulteration. There are a few sections in Germany, especially western Germany, where phosphate of ammonia is used. This is a compound of sulphate of ammonia and acid phosphate.

"The increasing cost of labor has recently encouraged the tendency toward the use of mixed fertilizers. In Italy, as well as in France, there has been introduced a mixture of phosphate and nitrogen salts. There has been introduced in Germany and Belgium a special product made up of silicate of potash and of phosphate; this product has been tried out in Italy. There is still hesitation on the part of the farmers to used mixed fertilizers. Moreover, the big industries, especially those engaged in the manufacture of acid phosphate, are against the use of mixed chemical fertilizers since their extensive use would compel them to change their manufacturing and selling organizations."

Make Their Own Mixtures

A more general review of the entire fertilizer situation in Europe seems to indicate the following. In Germany the farmers prefer to buy single ingredients and to make up their own mixtures. The most notable exception is that of so-called ammonium - superphosphate, which corresponds to a mixture of sulphate of ammonia and acid phosphate. This is applied to supply ammonia and phosphoric acid, while the potash is applied separately. In southern Germany, where the farms are small, and there are many gardens, generally, there is used to some extent a mixture containing ammonia, phosphoric acid and potash.

Basic slag, for many years an important source of phosphoric acid in Europe, is gaining in popularity at present as a phosphatic fertilizer. Many farmers use a home-mixed material made up of basic slag and kainit, or some other potash salt. This is applied in the summer or fall. The nitrogen is then used in the spring.

Altogether, the tonnage of mixed fertilizer in Germany does not exceed fifteen per cent of the total. On the other hand, as already noted, in the case of England the use of mixed fertilizer in that country is much more prominent. It is estimated as about forty per cent of the total. This represents a reduction from the total of about eighty per cent of mixed fertilizer used in England about thirty years ago. In France and in Belgium about fifty per cent of the total tonnage represents unmixed materials, while the other fifty per cent represents mixtures of acid phosphate with other fertilizers.—J. G. Lipman.

Planting Problems

Please give me information and advice on the following questions. I intend to sow soy beans in corn stubble in spring, plow them down in fall and use the field for potatoes the following spring. Would you advise following this plan for raising potatoes, also what kind of beans would give best results? How many bushels should I sow to the acre, also what time should I plow them down in the fall for best results? I also intend to sow soy beans in clover sod this spring which I plowed this fall and use the field for potatoes the following year. What do you think the results will be from this plan.—H. J. DeL., Schuylkill County, Pa.

Any effort to improve the fertility of the soil should not be more expensive than is necessary. The plan that you have in mind would, undoubtedly, increase the content of nitrogen and of vegetable matter in the soil. However, the same purpose may be accomplished at a smaller cost by a somewhat different arrangement.

A Better Plan to Follow

By following the plan outlined, namely, growing soy beans next year for the purpose of soil improvement, you would lose the use of the land for an entire season. It would be better for you to sow oats with clover in the spring, to harvest the oats either for hay or grain and straw, and plow under the resulting clover crop in the following spring. If you have a satisfactory catch of clover the land would be in better shape for potatoes than it would be if you grew soy beans and plowed the land either in the fall or in the following spring preparatory to planting potatoes.

Instead of red clover, you could use sweet clover or a mixture of red, alsike and white-flowering sweet clover. Should you, however, decide to grow soy beans as suggested in your letter, a variety like Mammoth Yellow, or even Wilson, would best answer your purpose. If the beans are broadcast, about one and one-half bushels of seed per acre would be required. If drilled in rows and cultivated, about one-half bushel of seed per acre would be sufficient.

The resulting soy bean crop might be plowed in the late fall, or the crop allowed to remain on the ground and plowed under in the spring. Where the land is subject to leaching or erosion, the spring plowing would be preferable. On the other hand, for land that is reasonably flat and heavy in texture, fall plowing might represent a better practice.—J. G. L.

Please Answer

1. Can corn and cob meal, mixed with ground oats be safely fed to horses? 2. What is the best variety of soy beans to grow with ensilage corn in Susquehanna County? 3. What mixture of grass seeds would you recommend for seeding down to permanent pasture?—H. B. S., Susquehanna County, Pa.

1. The practice of feeding corn and cob meal to horses is not approved by many careful feeders. It is claimed that corn and cob meal thus fed is likely to cause trouble. Hence, mixtures of shelled corn and oats are recommended instead—two parts of corn to one part of oats by weight.

2. All things considered, the Wilson variety of soy beans would be quite suitable for growing with ensilage corn in Susquehanna County. It has been shown by tests at a number of experiment stations that one acre of soy beans and one acre of corn grown separately will produce a larger tonnage of ensilage than two acres of corn and soy beans mixed. This is accounted for by the shading of the soy beans growing in the corn and by the less satisfactory moisture conditions for the two crops when grown mixed.

The same is not true of oats and peas or of timothy and clover, for careful tests have demonstrated that two acres of oats and Canada field peas, or of timothy and clover, will produce a larger total yield of forage than the same crops grown on a like area separately.

3. The following mixture of grass seeds should give you good results for permanent pasture.

Timothy, 3 lbs.; orchard grass, 2 lbs.; red top, 2 lbs.; Kentucky blue grass, 2 lbs.; Italian rye grass, 1 lb.; meadow fescue, 2 lbs.; red clover, 4 pounds.; white clover, 2 lbs.; sweet clover, 2 lbs. This would give you a thick sward and should be satisfactory for both early and late grazing.—J. G. Lipman.

State Champion Club Girls

THE thirty-two girls in the accompanying photograph had the honor of representing ten thousand club girls in the United States at the Fourth National Boys and Girls Club Congress held at Chicago, November 27 to December 4th.

They are the state champions in the home economics projects and carry on the work as administered by the agricultural colleges and the United States Department of Agriculture cooperating in these projects.

These girls competed in such projects as clothing, canning, home furnishing and beautification; in fact, all of the fine arts which go to make up successful farm home makers. The 400,000 girls who are club members report products produced last year valued at $4,500,000.

These champions had all their expenses paid to Chicago by one of the large mail order houses.

Beef Cattle—Steers, good to choice, $9.25@10.25; cows, good to choice, $6@7; fair to good, $5@6; bologna cows, as to quality, $2.50@3.50; bulls, good to choice, $6.25@7.25; fair to good, $5@6.25; calves, choice, $13.50@17; fair to good, $13.50@15; common, $9@11; Tennessee, choice, $12@13; fair to good, $9@11; common, $6@8.

Sheep and Lambs—Sheep, wethers, extra, $10@10.50; fair to good, $7@9; common, $3@4; ewes, heavy, fat, $8@9; lambs, extra, $15.50@16; medium, $14@15; common, $12@13.

Hogs — Western, best, $15.50@15.75; nearby, handyweights, $14.25@14.50.

City Dressed Stock—Steers, $18@20; heifers, $15@17; cows, $11@14; yearlings, top, $20@21; good, $17@19; calves, city dressed, $24@26; country dressed, 21@23; sheep, good wethers, $20@22; ewes, $16@18; hogs, $20.75; lambs, $30@32.

HAY AND GRAIN

Hay—Timothy, No 1, nominal; No 2, $24@25; No 3, $20@21, light clover mixed, No 1, $23@24; No 2, $20@21; straw, straight rye, $16.50@17; wheat straw, $16@16.50; oat straw, $15@15.50.

Wheat—No 2 red winter, in export elevator, as to location, $1.88 bid; No 2 red winter, garlicky, $1.83 bid; lower grades are selling at the usual market difference.

Corn—Car lots for export: No 2, 79c bid; No 4, 73@74c. Car lots for local trade: No 3 yellow, 82@83c.

Oats—Car lots, as to location: No 2 white, 51½@52½c; No 3 white, 50½@51½c.

DAIRY MARKET

Butter — Quotations: Solid-packed creamery, in tubs, extra, 92 score, 47c; high-scoring goods, 48@51c, the latter for small lots; 91 score, 46½c; 90 score, 46c; 89 score, 44c; 88 score, 43c; 87 score, 42½c; 86 score, 42c; best prints, 92@94 score, 50@51c; cartons, 51@52c; good prints, 88@91 score, 46@48c; cartons, 47@49c; ordinary farmers' prints, 44@46c.

Cheese—New York, whole-milk, flats, held, 28@28½c; longhorns, round lots, 26½@27c; jobbing, small lots, 28½@29c; single daisies, held, 26c.

LANCASTER MARKETS

February 8, 1926.

LIVESTOCK

Review of local market for week ending February 6, 1926: Market draggy. Cows and bulls predominating in receipts. Comparisons with week ago: Beef steers steady, in-between grades showing stronger undertone; bulk of sales, $8.50@9.25. Bulls steady to strong, spots 25c higher. She stock firm, bulk cows $4@5.25. Stockers and feeders showing little action, few sales at prices about steady. Calves strong to 50c higher for week; top vealers, $16.50. Hogs steady at week's advance or 50@75c higher; top westerns, $15.

Receipts for Saturday's market: Cattle, 7 cars; 1 St Louis, 1 West Virginia, 1 Penna, 1 North Carolina, 1 Chicago, 1 Iowa, 1 Tennessee, containing 191 head, 80 head trucked in from nearby. Total cattle, 271 head; 9 calves, 338 hogs. Receipts for week ending February 6, 1926: Cattle, 46 cars; 19 Penna, 6 Chicago, 5 St Paul, 4 Virginia, 3 Iowa, 2 St Louis, 2 Tennessee, 2 Kansas City, 1 West Virginia, 1 Indiana, 1 North Carolina, containing 1152 head; 385 head trucked in. Total cattle, 1537 head; 82 calves, 1415 hogs, 130 sheep. Comparisons with week ago: Cattle, 53 cars; 1295 head; 314 trucked in Total cattle, 1609 head; 59 calves; 1269 hogs.

Steers:—	
Good to choice	$9.25@10.25
Fair to good	8.50@ 9.25
Medium to fair	8.00@ 8.50
Common to medium	6.50@ 8.00
Cows:—	
Good to choice	6.00@7.25
Medium to good	4.50@6.00
Common to medium	3.75@4.50
Canners and cutters	2.25@3.75
Calves:—	
Good to choice	14.50@16.50
Medium	11.50@14.50
Common	5.00@11.50
Hogs:—	
Heavyweights, 200@250 lbs	14.00@14.50
Mediumweights, 150@200 lbs	14.50@15.00
Lightweights, 100@150 lbs	14.25@15.00
Rough stock	10.75@14.00

BALTIMORE PRODUCE

Butter — Creamery, fancy, 48c; do, choice, 45@46c; do, good, 43@44c; do, prints, 48@50c; do, blocks, 47@49c; do, ladles, 34@36c; Md and Penna, rolls, 30@35c; Ohio and W Va rolls, 30@35c; store packed, 30@31c; Md, Va and Penna, dairy prints, 30@35c; process butter, 40@41c.

The Trend of the Markets

THE figures in the following table represent the approximate unweighted average prices of the commodities and grades specified. The prices are based upon quotations from the market page of Pennsylvania Farmer.

	This week	Last week	Month ago	Year ago
Butter, 92 score creamery extras (N. Y.)	$.46	$ .46½	$ .44	$ .39½
Eggs, fresh gathered extra firsts (N. Y.)	.34	.37	.41½	.46¾
Chickens, live, by express (New York)	.36½	.37	.32½	.28½
Potatoes, 150-lb sacks (Philadelphia)	6.92½	7.05	7.25	1.75
Steers, good to choice (Lancaster)	9.75	9.75	10.00	9.50
Hay, Number 2 timothy, baled (Phila.)	24.50	25.00	24.50	21.50
Wheat, No. 2 red winter (Philadelphia)	1.88	1.88	1.80½	2.06½
Corn, No. 2 yellow (Philadelphia)	.79	.81¾	.88	1.45
Oats, Number 2 white (Philadelphia)	.52	.52½	.53	.70½

Eggs — Market weak; nearby fresh-gathered firsts, three sales, 150 cases, at 32c; late offerings at 32c; bid 31½c; no sales.

Live Poultry—Chickens, old hens, 4½ lbs and over, 30@31c; 3½@4 lbs, 27@29c; Leghorns and other light fowl, 23@25c; young chickens, large size, fat, 34@35c; 2 lbs and under, fat, 38@40c; Leghorns and other light stock, 28@30c; all kinds, poor and thin, 24@25c; old roosters, 18c. Ducks, White Pekins, 33@35c; Muscovy, young, 31@32c; puddle, 31@32c. Geese, nearby, 24@25c; Kent Island, 24@26c; western and southern, 18@22c. Turkeys, young, 9 lbs and over, 50@52c; old toms, 40@45c. Guineas, young, large, 75c; young, small, 50c; old, 35c. Pigeons, young and old, pair, 25@30c.

YORK PRODUCE

HAY AND GRAIN

Feed—Quotations were as follows, all prompt shipment: City bran, $35; middlings, $35, in 100-lb sacks; red dog, $44.50 nominal, in 100-lb sacks; western spring bran, $33.60@34.60; standard middlings, $33.60@34.60; flour middlings, $39; red dog spot, $42.60, all in 100-lb sacks, all-rail and lake-and-rail shipment; white hominy feed, $35, all in 100-lb sacks; cottonseed meal, 36 per cent protein, $39.50; prompt shipment linseed oil meal, $52.50, in 100-lb sacks.

Hay and Straw—Hay, large bales, timothy and light mixed: No 1, $28; No 2, $26@27; No 3, $23@25; sample, $14@17. Straw, large bales, rye, $19@20.

Grain—WHEAT, No 2 red, c i f, dom, $2.04⅝; No 1 dark spring, c i f, domestic, $2.00⅝; No 2 hard winter, f o b, export, $1.97⅝; No 1 North Manitoba, in bond, f o b, export, $1.83⅞; No 2 mixed durum, f o b, export, $1.68⅝. CORN, No 2 yellow, 95⅝c; No 3 yellow, 92⅛c. OATS, No 2 white, 52c; No 3 white, 51c; No 4 white, 49½c; ordinary white, clipped, 51¼@54c; fancy white, clipped, 55@56½c.

CHICAGO LIVESTOCK MARKET

Cattle—Compared with week ago: Fed steers mostly 25c lower; few choice kind on all weights steady; weighty bullocks in very liberal supply; stockers and feeders dull; top heavy steers, $11.25; light yearling heifers upward to $10.25; she stock, 25@50c lower; canners and cutters showing most decline; bulls and vealers mostly steady. Week's bulk prices follow: Fed steers, $8.65@10.25; fat cows, $5.25@6.75; heifers, $7@8.25; canners and cutters, $4.15@4.50; veal calves, $11.25@13; stockers and feeders, $7.25@8.25.

Hogs—Uneven; light weights steady at Friday's average; others 10@20c lower; tops on all weights, $14; bulk, 250@300-lb butchers, $12.30@12.55; sorted, 190-lb down, largely $13.50@13.80; bulk desirable 200@225-lb weights, $12.80@13.25; majority packing sows, $11@11.25; heavyweight hogs, $12@12.60; medium, $12.30@13.35; lights, $12.40@14; light lights, $12.50@14; packing sows, $10.90@11.40; slaughter pigs, $11.50@14.

Sheep—Compared with week ago: Fat lambs, 25@50c lower; yearling wethers and fat, aged sheep strong to 25c higher; feeding lambs steady. Tops for week: Fat lambs, $15.25; feeders, $15; yearling wethers, $13.50; two-year-olds, $12; fat ewes, $9.60. Week's bulk prices follow: Fat and feeding lambs, $14.25@14.85; cull native lambs, $12@13; yearling wethers, $12.50@13.50; fat ewes, $8.25@9.35.

WOOL MARKET

Boston, February 6, 1926.

Domestic—Ohio and Penna fleeces—Delaine, unwashed, 53@54c; ½-blood combing, 53c; ⅜-blood combing, 53@54c; fine unwashed, 47@48c. Michigan and New York fleeces—Delaine unwashed, 50@51c; ½-blood combing, 51c; ⅜-blood combing, 53@54c; ¼-blood combing, 53@54c; fine unwashed, 46@47c. Wisconsin, Missouri and average New England—½-blood, 48@49c; ⅜-blood, 49@50c; ¼-blood, 50c.

GRASS SEED—WHOLESALE PRICES

Toledo, Ohio, February 6, 1925.

Cloverseed, cash, domestic, $20; imported, cash and February, $15.70; March, $15.75; October, $16. Alsike, cash, $16.60; March, $16.75. Timothyseed, cash and February, $3.57½; March, $3.60 bid.

FEED PRICES

The prices below are for prompt shipments based on payment on arrival of cars as quoted by the Philadelphia jobbing trade to retail feed dealers on Monday, February 8. Quotations cover solid carlots for delivery at Philadelphia or Scranton rate points.

Pure spring bran	$33.00@33.50
Spring bran	32.50@33.00
Soft winter wheat bran	34.50@36.00
Hard winter wheat bran	33.00
Standard middlings	33.00
Soft winter wheat middlings	33.50@34.50
Flour middlings	35.50@39.50
Red dog flour	41.00@44.50
White hominy	34.00@34.50
Gluten feed	43.00@45.00
36 per cent cottonseed meal	37.50@38.00
41 per cent cottonseed meal	40.00
43 per cent cottonseed meal	42.00
34 per cent linseed meal	51.70@53.25

Millfeed easier under increased offerings and light demand.

For Baltimore, Cumberland and Williamsport rate points, subtract 20c per ton (for cottonseed meal 40c per ton); for New York, Newark rate points, add 40c per ton (for cottonseed meal 60c per ton); for Woodbury, Bridgeton rate points, add $1.00 per ton; for Freehold, Toms River, Cape May rate points, add $1.40 per ton.

Philadelphia Markets

CAULIFLOWER advanced sharply on the Philadelphia produce market February 6th. There was only one car of California cauliflower offered and the demand was active, according to the Pennsylvania and Federal Bureau of Markets. Pennsylvania celery has been in light supply and prices have advanced.

Apples continued dull but dealers report that supplies of nearby stock are cleaning up and a more active demand is expected. Brussels sprouts from New York state have been in light supply and most of the stock was of only fair quality. The New York sprout season is practically over and California is becoming the chief source of supply.

Root crops moved slowly while sweet potatoes showed a stronger tendency. The liberal supplies of spinach was a feature of the market during the week and prices dropped. Pennsylvania mushrooms have been in moderate supply and quotations have showed little variation. Trading has been slow and the demand limited.

The potato market has been dull with a slow demand. Pennsylvania round whites opened on Monday at $7 to $7.10 per 150-pound sack and closed at $6.85 to $7 per 150-pound sack.—W. R. W.

Butter Markets

CONSIDERABLE firmness was in evidence at all markets early in the week ending February 6th. Supplies were somewhat limited and with demand fairly active the markets appeared quite healthy. Because of the rather sharp fluctuations during the latter part of January the markets were already sensitive and the trade generally was uncertain what the major trend would be but appeared to favor lower prices.

Receivers under existing condition were anxious to keep goods moving and slight accumulations were viewed with concern even to point of anticipating following days markets in order to interest buyers. This free selling policy tended to increase the sensitiveness of the markets and buyers began to follow a very conservative course, were critical regarding quality, and reduced reserve stocks to a minimum.

On Thursday and Friday nervous and easier tones were apparent on all markets with some price declines effective, especially at Chicago, where buying support was withdrawn on both the spot and future markets.

Receivers quite generally report a slight increase in shipments from individual factories and these reports are somewhat confirmed by the sizeable increase in receipts on the four markets which for the week up to Friday were 4930 tubs heavier than that of the week previous.

The change from the firm position of last week to the easier nervous condition which prevails at the moment further unsettled the minds of the operators as to future trend. Some arguments are advanced which favor steady and unchanged to higher markets while others favor easy and declining markets. At the close of the week all markets appeared very nervous and unsettled with sentiment at such a wide variance that it is difficult to arrive at any definite idea of the future trend.

County News and Comment

Armstrong County, Pa.—Not a ray of sunshine has visited this locality since January 30 when we had a fifty-eight-degree temperature. Last night we had a fall of six inches of snow. Farm work is at a standstill. A few farmers having considerable orchard acreage have been busy pruning, hauling out brush and mulching trees preparatory to applying the dormant spray. A few bunches of early-littered pigs yielding dressed carcasses of from 130 to 200 pounds each are being marketed at eighteen to nineteen cents per pound. While the winter thus far has been one of real severity, demanding full feeding for all stock, hay and roughage seem abundant and capable of lasting to the end of the feeding period. A good percentage of our general farmers feed a very light grain ration, consequently corn cribs, well filled last fall, show less leanness than ordinarily at this period. Manure is being hauled, as made, to spring corn and potato plots. The usual custom being to broadcast, either by hand or spreader, eight to twelve tons to the acre. Much loss has been sustained on extra-early litters of pigs, in some instances exceeding fifty per cent. Wheat has fluctuated but little since December 15, selling at about $1.60; corn, 85c; rye, $1.10; oats, 50c; certified seed is higher still. Poultry, fat hens will bring 35c; butter and eggs, neither plentiful and yet selling at 40c each, pound and dozen respectively. Clover seed sowing will begin the latter part of this month. Bituminous coal mines all operating night and day.—W. M. P., Feb. 5.

Berks County, Pa.—Weather conditions so far this winter have been ideal. All heavy butchering was done before the heavy snow made its appearance. Today we had our first experience with an old time blizzard. Farm Products Show was well attended and practically every part of the county was represented at Harrisburg. Grange meetings were well attended all winter. Berks County Pomona will meet at Kutztown on Saturday, March 6th. Mr. Gordon, of State College, will help to prepare a program with local talent. It will be held in the Park Theatre. The members of Kutztown Grange will provide dinner for all delegates who may attend. Wheat sells at $1.85; corn, 75c; eggs, 38c; potatoes, $2.50.—W. N. M., Feb. 4.

Blair County, Pa.—January has been very changeable. Just at present we are having some of the roughest weather so far this winter. The temperature is staying close to zero and there is a very high wind. We have had some good rains, yet some wells are dry and streams low. Some roads are closed with snow. There were a number of exhibits at the State Farm Products Show from this county and a number of our citizens attended the show. The writer was there and it is a pleasure to say that all with whom I talked while there were impressed with the quality of the products shown. Wheat is moving more briskly now as it nears the price of two dollars. Some ice is being stored for future use. Farm sales will soon be in progress, there is at present a fair demand for tuberculosis-free cows at fair prices. Wheat is now selling for $1.80 a bushel. Eggs, 45c; old chickens, live, 25@28c.—H. E. H., Jan. 29.

Clearfield County, Pa.—The weather has been changeable and very cold spells; the lowest here at high altitude being ten below zero. Fine ice was stored in larger quantity than usual. Winter grain has been slightly protected by light snows, these usually drifting. Most of our roads are open to motor traffic. Apples are selling in our local markets at $1@2, as per grade and variety. The market is dull on account of cars of common stock from New York reaching our market on open consignment. Potatoes are in demand at $1.75@2; butter, 60c; eggs, 30c, a rapid and untimely slide in price. Dressed pork 18c; beef, by the quarter, 14@18c; hay and straw market quiet.—D. H. W., Feb. 2.

Carroll County, Md.—Last Thursday was the roughest, coldest day we have had this winter. A high cold wind prevailed all day and no snow covered the ground as a protection for wheat. Wheat and barley in fair condition even tho weather conditions have been unfavorable. Not much outdoor work has been accomplished lately because of rough windy weather, the main work being grinding feed and attending livestock. Prospects are for less than usual number of spring sales. A number of farm homes over the county are supplied with electricity either from commercial current or from home generating plants. Radio makes it possible for the farmer to enjoy the long winter evenings. I believe the greatest need of the farmer at present is a solution of his marketing problem. And the greatest need of the farm home is more conveniences. It is surprising at the large number of farm homes in which water is still carried from an outside source. An unknown luxury in many a home is a sink and drain. Another convenience which should be in more homes than it is at present, is a power washing machine. Prices are: wheat, $1.80; corn, $3.50 bbl. of 350 lbs.; eggs, 36c; old hens, 26c.—H. I. R., Jan. 31.

Clarion County, Pa.—The last week in January was zero weather and a big snow storm which filled the road. Shoveling and thawing weather have opened them again. The wheat fields look fine. Butchering not all done yet as a good many farmers had few pigs last spring and had to buy. Price of dressed pork still 16c. Some farmers butchering beeves and selling from 10½c to 14c, some still holding for more money. Wheat going up in price. One carload shipped for $1.70; butter and eggs dropping very fast in price which takes the farmer's profit on account of high priced feed. Quite a lot of idle men around looking for work. Cloverseed high in price this spring. The retest for T. B. is expected in the next two weeks to clean up the herds.—C. R., Feb. 4.

Jefferson County, Pa.—The winter was rather mild thru December. Now everything is covered with snow again, grain and grasses will be protected from cold winds and freezing. Stock wintering well. Butchering about all done. Farmers doing chores, hauling coal, hay and straw, some lime being hauled. Small lots of timber being logged and sawed into lumber. Local lumber market a little dull. A few potatoes being loaded at $2. A few local market prices: country butter, 50c; eggs, 45c; potatoes, $2@2.50; oil meal and cottonseed, $2.75 cwt; oats, 50c bu.; coal, $2@2.60 ton, mine run. An exhibit of potatoes from five sections of Jefferson County were shown this year at the International Livestock Exposition at Chicago, taking fifth place among 100 exhibits from twenty states. The boys' and girls' potato clubs won many prizes at the State Farm Products Show at Harrisburg. Famrers of the county bought a few more outstanding Berkshire brood sows at the State Farm Products Show. Howard Fleming, sophomore of Union Vocational School, won first honors in the bee project contest in Pennsylvania. The State Beekeepers' Association presented him with a gold medal while in convention at Harrisburg.—F. A. M., Jan. 27.

Lackawanna County, Pa.—January has been a mixture of rain, foggy days with mud and spring-like weather, followed by a heavy fall of snow on the 8th and 9th. Roads are drifted, making travel impossible in many places. The 29th was the coldest 29th of January in twenty-five years, twelve degrees below zero. Farmers busy harvesting ice, hauling and cutting ice, hauling and cutting wood for home consumption and selling the surplus. Wood selling for $6 per cord, stove wood length. The situation in many local industries is growing more distressing as the mine suspension lengthens. The Farm Bureau Association held their annual meeting at Clark Summit, January 27th. Lunch was served by the ladies of South Abington Grange. There was a separate session in the morning for the ladies under the direction of Miss Ruth Patrick, home econmics extension worker. A splendid program was arranged by County Agent L. E. White. There were two fruit specialists and they gave some very good pointers on insect control. A representative from the Bureau of Animal Industry gave a talk on the T. B. eradication. Potatoes have varied to 75@90c pk.; eggs and butter took a drop, butter, 48c; eggs, 60c.—E. A. K., Feb. 1.

Lancaster County, Pa.—We have been visited with a number of cold spells, but they usually lasted only a day or two at a time. Scarcity and high price of coal have meant that many have been burning wood this winter. Neglect to clean the pipes and flues as often as they should be has caused a number of chimney fires. There has been very little snow, and the fall wheat does not look at all well. Tobacco stripping is well under way and is beginning to sell at from twelve to fourteen cents per pound for wrappers. Eggs are 38c; butter, 50c; lard, 18c.—R. C. R., Feb. 1.

Lebanon County, Pa.—At this writing the ground is covered with snow and it is snowing today, giving good protection to the grain and grass fields. Some radio sets were installed thruout the county last fall and this winter, which are a means of spending the evenings more pleasantly. There are yet some farms for sale and some without tenants. The Farm Products Show, held at Harrisburg recently, was well attended by Lebanon County farmers and pronounced the best held yet. The usual number of prizes were awarded to our exhibitors. Many county people are engaged in sawing wood and delivering same in Lebanon and surrounding towns. Farm stock sales are being held daily, and good prices realized. The indications are that hired help will again be rather hard to get, and many are obliged to operate their farm with their own help and the aid of improved machinery. Prices: wheat, $1.75; corn, 90c; rye, 90c; hay, $18; straw, $12; potatoes, $2.60; apples, $1.50@2; butter, 50@55c; eggs, 40c; milk, $2.40 cwt.—P. L. M., Feb. 3.

Montgomery County, Pa.—We are having a very open winter, there being no snow at the present time, but very cold. Temperature around zero. Grain needs a covering of snow. Most of the manure is hauled out and fields cleared of corn stover. Many farmers who have woodlots are realizing a nice profit in the sale of firewood. People have accustomed themselves to the use of coal substitutes and not much complaining is heard. Quite a few miners have passed thru here looking for work. The general farm outlook for 1926 is fairly bright but the industrial conditions are none too good. City and town folks are realizing more and more the importance of the prosperity of the farmer in relation to the prosperity of the country in general and various business associations and clubs are holding cooperative meetings. Prices: wheat, $1.75; corn, 90c; mill feeds slightly higher, bran, $2; gluten, $2.40; oil meal, $2.90; eggs, 48c; chickens, 25@30c; dressed pork, 16c.—C. N. D., Jan. 29.

York County, Pa.—Weather rather uneven during past month. We have had a number of extremely cold days, but as yet hardly any snow. There have been but few days all winter when it was not fit to work outdoors. T. B. testing on the area plan was started Monday, January 25, in York County. Six townships are signed up for the test at the present time. Four of these will be tested now and the other two in probably one or two months. The annual farm bureau meeting was held January 28 in the county court house. The attendance was the best in the history of the organization, there being over 200 men present. At the noon hour the annual get-together banquet of the city business men and the county farmers was enjoyed by nearly 500 men. The principal speaker at the banquet was W. G. Spillman of the United States Department of Agricultural Economics, Washington, D. C. H. M. Havner and E. L. Nixon, of State College, delivered addresses at the afternoon session. The annual school directors' meeting was held January 28 at York with a good attendance. Ex-governor Brumbaugh was one of the speakers at this meeting. Wheat, $1.78; corn, 80c; rye, 95c; oats, 42c; four per cent milk, $2.75; hogs, live weight, $13.50; eggs, 32c.—W. K., Jan. 29.

Prices and Prospects

COLD weather and a limited demand held up potato shipments during the last week of January. Shipping point markets in the East and North showed little change but during the early part of the week ending February 6 a weaker tone prevailed. The large consuming markets also reflected this dull condition and altho prices did not decline to any extent, trading was very slow. Buyers are holding off and there are considerable quantities of potatoes coming out of storage.

During September, October, November and December of 1925 there were 2355 cars of potatoes unloaded in Philadelphia compared with 2209 in 1924. Prices in 1925 during this period were about three times as high as the previous year. Large quantities of these potatoes were stored and with the market showing a weaker tendency, dealers are beginning to market this stock and are not buying.

One large chain store featured a sale of potatoes at five pounds for twenty-five cents which is equivalent to $5 per hundred or $7.50 per 150-pound sack. This is about the same price that the independent store would have to pay for its stock. It is likely that this has had some effect on the markets. These conditions are not only true in Philadelphia but also exist in practically all sections of the country.

The total shipments from the leading late producing states up to the end of 1925 amounted to 112,776 cars, an increase over 1924 when 110,252 were shipped. Growers know that 1924 was a year of heavy production and low prices, while in 1925 we had the lightest per capita production in years with high price levels. This is another factor that is having a disturbing effect on market conditions. The explanation lies in the fact that a much larger percentage of the crop is moving in commercial channels than for many years.

Potatoes that were not worth hauling last season have brought good hard cash this year. Scabby, cracked, undersized potatoes that would usually be kept at home, fed to cattle, or sent to starch factories have been arriving on the market and going into consumption.

The future of the potato market this season is uncertain and depends on so many factors that it is unwise to make predictions.

The New York egg market weakened on account of heavier receipts during the week of January 26 to February 8th. Milder weather in the principal egg producing sections had a depressing effect on the market. Nearby eggs were more plentiful and prices were lower. Prices also declined in Philadelphia and trading was slow on all but fancy grades. Extra firsts sold at 35c per dozen on February 3 and firsts at 32c. Egg receipts in Philadelphia for the week totaled 25,331 cases, of which number Pennsylvania furnished 2531.

Live fowl and chickens were in light supply in New York and the market held steady. Broilers and pullets were firm, while old roosters were scarce and wanted. Dressed fowl were in moderate supply and the market steady. Live poultry held firm in Philadelphia during the latter part of the week and moved fairly well.

An advance of one cent on 92 score butter was the main feature of the Philadelphia butter market during the week ending Wednesday, January 27th. The supply of fancy butter was fairly liberal and the demand was not active in wholesale channels, as some of the large buyers were reported to be receiving more than enough butter for their needs from their own direct shippers. As a result receivers found some trouble in effecting a satisfactory clearance.

Advance on Butter

The advance of one cent occurred in two stages of a half cent on Friday and another half cent on Wednesday. The advances were due in a large measure to firmer and advancing markets at New York and Chicago. When trading on the Philadelphia market is active, 92 score is in most cases quoted at a full cent over 92 score in New York. However, during the early part of the week the differential was only a half cent in favor of Philadelphia. The closing three days of the week the same price was quoted in Philadelphia and New York.

Medium grades were in fair demand with 90 score advancing a cent and a half to 46c. Receipts of undergrades were somewhat more liberal and advanced only a half cent during the week. At the close 92 score was quoted at 47½c at Philadelphia, 47½c at New York and 45c at Chicago. Storage 92 score was quoted at 45c in New York.

Trading on the Boston wool market showed little change during the week ending February 2nd. The market for fleece wools has been steady and a limited quantity has been bought by the mills. Values for this class of wools are generally firm.

Hay receipts were generally liberal and were fully ample for buyers' needs. Cold and storms over a wide area were stimulating the demand for hay. Good hay moved readily at all markets but common hay sold slowly. Timothy averaged lower, altho Boston and New York markets ruled steady on light receipts.

The grain market held steady during the week. Cash grain held firm upon active demand and moderate receipts. The demand for corn and oats held the market firm despite the fairly large receipts. The movement of corn has become slightly larger as roads are generally in good condition.—W. R. Whitacre.

Of Interest to Dairymen

PENNSYLVANIA dairymen will be interested in the announcement that the 1926 National Dairy Exposition will be held in Detroit at the Michigan State Fair Grounds, October 9 to 19th. This marks the end of the wanderings of the National Dairy Exposition for by 1927 it is expected that the new agricultural building which is being erected in Chicago will be far enough along to accommodate the cattle and machinery exhibits. The new building will become the permanent home of the Exposition following the 1926 show.—A. L. B.

Ready Money

at a time it will be needed - - - -

REAL SERVICE—immediately following a fatal accident, ready money to care for the unexpected expenses is a welcome relief to those upon whom the responsibility falls. If you should be the next, will your family be protected?

For Readers of PENNSYLVANIA FARMER

EVEN if you are careful—and most of us are—you must trust your safety to others—Auto Drivers—Engineers—even Providence. Just a moment's neglect by them and you may be the victim of a serious or fatal accident. A defective steering gear, a tire blown out, an unexpected rut or stone in the road or a sudden bolt of lightning may have disastrous results.

You cannot afford to trust to *luck* when only $1.00 yearly will protect you and your family from immediate inconvenience or want through a serious or fatal accident that may happen to you any day.

To have this needed protection immediately, fill in and return the application today. No medical examination is required.

This Travel-Accident Insurance policy, available to every reader of PENNSYLVANIA FARMER, will pay—

$5,000.00 for loss of life by wrecking of railroad passenger car, street, elevated or subway cars as specified in policy—

$2,000.00 for loss of life by wrecking of horse drawn or private motor driven vehicle, bus, taxicab or passenger elevator as specified in policy—

$1,000.00 for loss of life by being struck or knocked down while on a public highway or being struck by lightning, cyclones, tornado, as specified in policy—

$10.00 weekly for 15 weeks for all injuries sustained in the above manners as specified in policy.

PENNSYLVANIA FARMER is not in the insurance business but in line with its many years of service, PENNSYLVANIA FARMER has arranged for its readers the best and the greatest protection that can be given for the low cost—and it is available to every member of a reader's family. You owe it to yourself—you owe it to your family. The small cost of $1.00 a year places this protection within the reach of everyone. Send your application now.

$5,000.00

for only **$1** *a year*

Travel Accident INSURANCE

Any representative of PENNSYLVANIA FARMER will be glad to explain this policy to you. Applications must be made on the blank provided.

Notice: Not more than one policy can be issued to any one person, but any and all members of a reader's family may each secure one.

Application

Print each name and address clearly and carefully. Illegible names will delay the delivery of your policy.

for $5,000.00 Travel-Accident Insurance Policy issued to readers of PENNSYLVANIA FARMER, Phila.

PENNSYLVANIA FARMER
Insurance Department, Philadelphia, Pa.

I am a reader of PENNSYLVANIA FARMER, more than 10 years of age and less than 70 years, not deaf or blind or crippled to the extent that I cannot travel safely in public places, and hereby apply for a $5,000.00 Travel-Accident Policy in the Federal Life Insurance Company issued thru PENNSYLVANIA FARMER. Enclosed is $1.00 (one dollar.)

To Centralize Activities

Jersey Farm Groups Plan to Open Trenton Office

LEADING farmers, recognized the weakness of the smaller farm organizations in New Jersey, have been seeking a way to coordinate the activities of the smaller associations to the end that they might present a united front on matters of common interest. In response to this demand, the New Jersey Federation of County Boards of Agriculture, which is the New Jersey unit of the American Farm Bureau Federation, presented a plan during Agricultural Week to centralize the activities of the various farm groups. The proposal met with decided favor at a gathering of nearly 200 association representatives and farm leaders in Trenton. As a result, the farm bureau called for committees from each of the organizations to meet as a joint committee and to develop ways and means to bring the farm groups closer together.

In a word, the plan is to bring farmer organizations of the state into a united body and to provide central office accommodations at Trenton to handle the activities of the individual associations in which all of the groups are mutually interested. The New Jersey Federation, the New Jersey State Grange, the New Jersey State Horticultural Society, the Holstein-Friesian Cooperative Association of New Jersey, the New Jersey State Potato Association, and the New Jersey State Home Bureau have already endorsed the idea and are appointing committees to represent them at a general conference on the subject to be held in February.

New Jersey farmers quite rightly are proud of their individuality, and the organized groups of breeders, growers and commodity farmers are correspondingly proud of the individuality of their organization. Each organization, if the plan is adopted, will continue to operate by itself but will support a general office at Trenton.

Practical application of this idea has already been tried out in a small way. On such matters as agricultural legislation, for example, the New Jersey Federation and the New Jersey State Grange have functioned together for several years thru a joint legislative committee representing the wishes of these two largest agricultural groups in the state. As legislative matters of interest to fruit growers have come up within the past few years, the Horticultural Society and at times one or more of the breeders' associations have united with this legislative committee for the advancement of a measure or the amendment of a law.

The combined front of the fifteen farmer organizations of the state will give a united farm voice for the first time, and with a strength and prestige that will command more attention from legislators and the organizations of other industries.

Important Functions

The general office at Trenton, under the proposed plan, will number among its important functions the scheduling of hearings for the apple, peach and potato membership before the Interstate Commerce Commission, and the arranging of conferences on traffic schedules with the proper railroad officials. It will create a speakers' bureau, where the membership can secure speakers for their state, county or local programs. Development of local programs and methods of procedure will be another duty of the general office; also the crystallization of farm public opinion.

The New Jersey Federation is the only state farmer organization which has been maintaining an office at the state capital. The proposed plan will give all organized groups a Trenton office for the first time, meeting a need which has been frequently expressed in recent years. Control of the general office will be vested in an executive committee composed of representatives from all of the farmer groups taking part in the plan.—B.

Two Conflicting Viewpoints

Pessimism

WHOEVER thinks farmers don't work long hours should keep vigil with me almost any of these nights. Yes, I know this is haying and harvesting but it wasn't much better lots of times last winter. It's a quarter of eleven (P. M.), I'm so tired I'm staggering just waiting for my brother to get home—and supposedly he is more tired than I am because he has been working hard harvesting oats all day; yes, and half the night.

. . . .

It is six months since the above was written and here we are doing just the same in mid-winter! And most of our neighbors are doing the same—getting breakfast by artificial light and going out to haul wood as soon as the men and teams can find the road and unloading the last loads at night after bedtime!

When some genius invents headlights for bob-sleds no doubt they can haul wood all night. Talk about the farmer having nothing to do all winter! Just come out and try it once and see if you city working men ever got half as busy in June.

Every year we say we'll plan differently next year, we won't do this way; and sometimes we do plan different work but it's always endlessly long days no matter whether it's milking cows or harvesting grain or cutting wood.

Every one laughs at the suggestion of an eight-hour day on the farm but until we learn to limit our day somewhat, as other industries do, we can't expect to be otherwise than overworked and underpaid—the result is inevitable.—Mrs. E. M. Anderson, Chautauqua County, N. Y.

Optimism

WHO says "farming doesn't pay?" This year lots of farmers sold potatoes for more than their farms would bring on public sale. I have heard from one farmer who sold potatoes from eight acres for $9000. One of my neighbors raised 8000 bushels on about thirty acres. He was offered $2.50 a bushel. Figure the value of his crop.

Now this is in the community where farms sell ridiculously low—for far less than the buildings are worth. Of course, this is an exceptional year for potatoes but we seldom receive less than $1.00 in the fall, as we are close to good markets.

Corn is such a wonderful crop with us—immense yields—and hogs 20c a pound wholesale, dressed. I sold about $2000 worth of hogs last fall. I have a few acres of alfalfa and six acres of sweet clover besides soy beans, etc., for pasture and my hogs pay me good dividends and do not make me much work.

As I look at it, now is the opportune time to buy a farm. Everything seems to favor the farmer. Farming for me; I am satisfied.—C. R. Bashore, Berks County, Pa.

HILLPOT *Quality* BABY CHICKS

What is YOUR standard for judging chicks?

Is it sturdiness and vigor, which leads to EASE OF RAISING? O. F. Smith, NEW YORK, writes, "I never before had experience with chickens, yet from 101 Hillpot Chicks I raised 97".

Is it HEAVY LAYING of WINTER EGGS? "My 75 pullets from Hillpot Chicks laid 1548 eggs in January. My record was 70%, while the Vineland Contest in the same month averaged only 30%." states Mrs. Georgianna Gilbert, NEW JERSEY.

Superior Quality of my Chicks is proved not by what I say, but by what my customers know. Decide now on my "PROVED CHICKS for '26". Send for my beautiful new chick book FREE. Contains full page illustrations in colors of the famous breeds, shows by customers' letters how to be sure of securing the most profitable strains of

More Milk is a natural result of **Healthy Udder and Teats**

No need to tell an experienced cow owner that any condition of udder or teats that gives the cow discomfort causes a holding back of the milk.

Why, then, neglect even the smallest of these hurts? Why make the milking hard and the yield smaller?

For sore teats, teats cracked or chapped, stepped on, or injured in any way, just a rub of Bag Balm starts an immediate healing. For caked bag, bunches, inflammation of any kind this wonderful penetrating, healing ointment insures a quick rebuilding of healthy, normal tissues. Shortens the work of milking by keeping the teats soft, silky, pliable.

Bag Balm, in fact, has a hundred-and-one uses on the farm. Quickly heals any kind of animal sore or skin trouble.

Bag Balm is sanitary, clean and pleasant to use. Cannot taint the milk. Keep a can on hand constantly. Big 10-ounce can only 60c. If your feed dealer, general store or druggist is without Bag Balm, we will send it by mail, postpaid.

Booklet, "Dairy Wrinkles," sent on request.

HONEY FOR RADIATORS

The Other Side of the Story by One Who Has Used the Mixture Successfully

EDITOR, Pennsylvania Farmer:—With reference to the article in the January 30 issue headed "Honey in Radiators," your readers may be interested in both sides of the story.

There are a host of auto owners who are using the honey-water solution with satisfactory results. This is true both of the thermo-syphon and the water pump circulating systems. I have used it two winters without trouble. A friend of mine has so used it three winters with satisfaction.

A mixture of equal parts of honey and water will give good results when the temperature seldom drops to zero; a stronger mixture is needed for lower temperatures.

Mix Ingredients First

The honey and water should be mixed before it is put into the radiator. Very warm water hastens the process.

The lower third of the radiator front should be protected with cardboard, or a radiator cover with adjustable front may be bought for the purpose.

The radiator should be about one inch less than full to provide for expansion of the liquid when it gets hot, without wastage by overflowing.

When car has been standing for some time either inside or out with a temperature of fifteen degrees or lower, blanket the radiator and run the motor for five minutes to insure the solution being in circulation.

If there is no waste by leakages of overflowing no more honey will be needed during the season, simply add water to care for loss by evaporation. The honey does not evaporate.

At low temperatures, say fifteen degrees F. or lower, the fifty-fifty solution may become like slush and non-circulating until warmed up as suggested.

If the temperature is so low as to cause slushing, there is no expansion such as to cause damage to the radiator.

Not Absolutely Trouble-proof

This mixture is not absolutely trouble-proof. The three common faults claimed against it are: the honey gets gummy; it leaks out in the cylinders; it eats holes in the radiator.

In the first case it is obvious the fault is in letting the water get low.

The mixture will unquestionably find its way out of very small leaks which, because of the accumulation of sediment or scales, still retain plain water. However, with ordinary care the water system can be maintained tight.

As to eating holes in the radiator, it is well known that honey, either alone or when mixed with water has no corrosive action. It will, however, clean out dirt and scales. In some cases a radiator holds water only because of the accumulation of dirt and scales inside. When these are loosened of course the liquid escapes.—E. G. Carr, Hunterdon County, N. J.

The Home Grounds

(Continued from page 17)

they should be planted some distance from the house.

When beautifying the farmstead it should be kept in mind that all plantings should be made so they will appear to belong to, and to blend in with the natural surroundings. You can plan to do a little planting each season so that the task will not seem so great, and the cost will be better distributed. The foundation planting should have first attention, then the following season the flower garden or lawn could be developed, and so on.—Mary C. McGovern.

An easy as driving nails. Makes a long lasting joint that protects belt ends. To take apart for lengthening or shortening belt, loosen belt and push out steel pin. Used by leading thresher, farm implement and belting manufacturers. Approved by agricultural colleges. Sold by nearly all hardware stores and implement dealers.

Veterinary

Conducted by Dr. J. F. Shigley

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We invite readers to make use of this service. Clippings from the column when properly preserved and classified, make one of the most valuable medical symposiums a farmer-stockman can obtain.

HOOF ROT.—I have a flock of Merino sheep of which a number have been bothered with sore feet for about a year. I think they have foot rot but am not sure. Please tell me the nature of the disease and what to do for it. Is this disease contagious?—J. F. W., Johnsonville, N. Y. Hoof rot in sheep demands careful attention. The treatment consists in a thoro cleaning of quarters, providing dry litter with a dry runway for exercise and an examination of the feet of each sheep. The feet should be cleaned and washed with an antiseptic solution and dried as well as possible. The hoof should be trimmed where necessary. The animals affected should be placed in a separate pen. The runway may be sprinkled with lime. Clean quarters, dry runways and regular examination will largely prevent hoof rot.

STRING HALT.—We have a horse seven years old and for about two years I notice that when he stands an hour or two and I try to start him he lifts his hind legs up to his ribs. After he goes a short distance he walks all right. It does affect his pulling a bit. What was, or is, the cause and is there a cure for it?—G. P. Z., Charleroi, Pa. Your description reads like a case of string halt. This may be due to a nervous condition which will produce a marked flexion of the leg when the horse is excited or to the shortening of the flexion tendon which attaches to one of the principal tendons of the hind leg. The condition resulting from the latter cause may be relieved by an operation that consists in severing the tendon. This is not always successful. As the case described is probably of a nervous origin, operative procedures would probably not correct the condition.

COW OFF FEED.—I have a cow that is apparently in good health except after she freshens. Three years ago, one week after she freshened, she was taken sick. Two years ago about two weeks after she was affected. This year I thought she would be all right as it has been three weeks since she freshened but she is the same again. Seems as tho she is bound up. Has no appetite and goes off almost entirely on her milk. This condition lasts from one to two weeks.—L. M. B., Spring Mills, Pa. It would be well to feed this cow oil meal, bran mashes and roots and give her free access to salt for a period of three to four weeks before calving. This would tend to relieve constipation. It may be that the cow is not having a ration with sufficient vitamins. Animals with too few vitamins will show up well before calving, but, to use the common expression, "go all to pieces" when their milk flow starts. An increase in the variety of the ration, including the foods mentioned above, will usually secure good results.

COW HARD TO MILK.—Can you tell me what to do for a cow that holds back her milk sometimes for two and three milkings? This makes her go dry too soon. We also have egg-eating hens. They break and eat the eggs in the nest. What is a cure.—E. S., New Holland, Pa. This is usually a nervous condition and is hard to handle. It requires a great deal of patience to handle such an animal. In general one should milk in the same quarters and at regular hours so as to lessen the nervous element in the milking process. EGG-EATING HENS.—Some writers have said that egg eating is hard to cure, but by providing a varied ration, such as oyster shells, green feed, digester tankage, milk and corn as basic rations, it might be prevented.

Our Readers' Classified Advertising Department

A market place to buy or sell at little expense. Over 90,000 farm families read Pennsylvania Farmer every week. Rate 8 cents a word each for one, two or three consecutive weekly insertions; 5 cents a word each for four or more insertions. Count each number and initial and send cash with order. Orders, discontinuances or changes of copy must reach us by Wednesday of week preceding date of issue. All advertisements set in uniform style, no display type or illustrations. Poultry advertising may run here, but if displayed or illustrations used must run in display advertising columns at commercial advertising rate (55 cents per agate line). Livestock advertising not accepted in this department. Minimum, ten words.

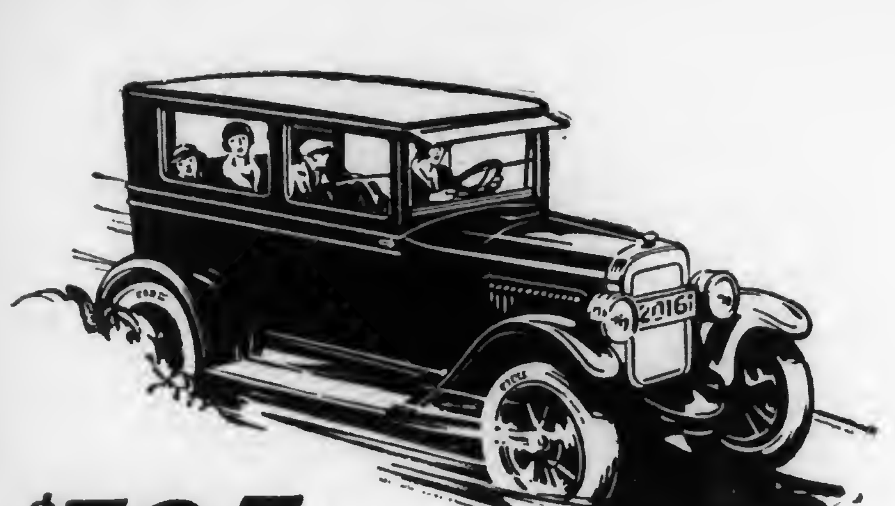
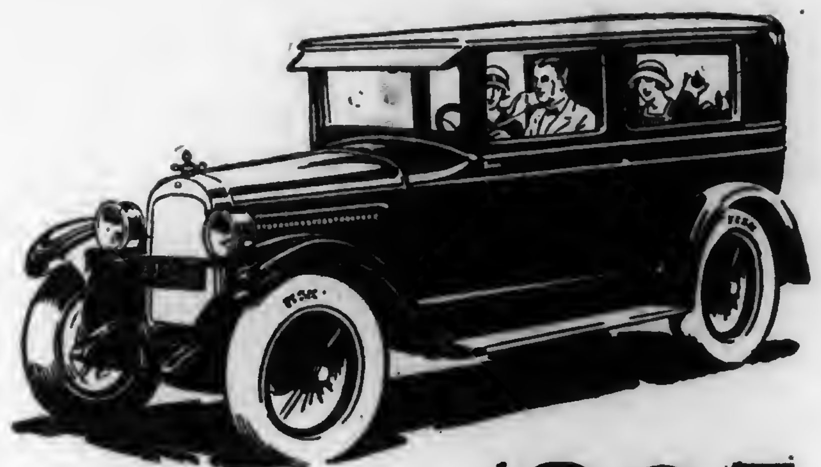
SITUATIONS WANTED

MANAGER of stock, grain or dairy farm. Understands all machinery. Can handle men. Life experience. Open April 1, 1926. Box 90, Pennsylvania Farmer, Phila.





$595 f.o.b. factory 4-Cylinder Standard Sedan

6-Cylinder Standard Sedan $895 f.o.b. factory

record-quality tells its own story!

"an opportunity that never before existed"

—the trim-looking light-car classic pictured above is the Overland Standard Sedan, a full-size 5-passenger 4-cylinder beauty patterned on smart modern lines, clean-cut, rakish, low. A roomy car, carrying 5 full-grown people in cosy comfort. Body finished in polished lacquer, a rich deep blue with flashing black and nickel trimmings—as handsome a light car as you ever looked at.

Extra big doors—extra wide—easy entrance and exit to both front and rear seats . . .

The Widest Seats of any light-car built—new single-piece undivided front seat, 39 inches wide, 19 inches deep. Wider back seat, 45 x 18—Lots of leg-room.

Very latest one-piece Windshield—you can always see where you're going.

Big Wide Windows—more than 20 square feet of window space —longer, deeper windows mean clear, uninterrupted vision . . .

New Cowl Ventilator—a modern big-car feature—a comfort only more costly automobiles give.

Triplex Springs—with 30 inches more spring-base on a 100-inch wheelbase—easier riding, easier driving . . .

A 27-horsepower engine—sturdy, reliable—fast on the straight-aways, great on the hills—extraordinary economy on gasoline and oil . . .

Sliding Gear Transmission—three-speed, selective—*at the lowest price at which you can have a car with this modern transmission . . .*

. . . if you've been thinking that only one maker could build the car you could afford, step in and see this Overland Sedan. Here's a *modern* closed car, priced at only $595!

"a magnificent big six —for only $895"

—*"a car of spectacular beauty"* with *"an engineering masterpiece under the hood of it"*—that's the Overland Six . . .

"*An exquisite color combination*"—it takes a woman to tell it—for "*exquisite*" is the only term that comes anywhere nearly describing the strikingly attractive color-ensemble of this handsome big automobile—Two beautifully blended tones of grey, topped off in glistening jet-black, a double beading all around the waist-line —*"The way they gather around it, and their open admiration—it is almost embarrassing,"* another woman-owner exclaims. Nothing so attracts the man-or-woman-in-the-street as something distinctly out-of-the-ordinary in an automobile!

"It's all that inside room that makes a hit with me"—Driving or riding, a man likes plenty of *space* to move around in. Put 5 full-grown people into the ordinary Sedan and *somebody* is crowded. Put the same 5 into this spacious big Overland Six and everybody feels like he's riding in a 7-passenger limousine!

"Over 5300 miles and the motor hasn't missed a shot"—No car is better than its engine. And in this 38 horsepower big Six you have an engine as nearly flawless as automotive engineering can make it.

All controls centered at the driver's finger tips . . . One piece windshield . . . Automatic windshield wiper . . . Sun visor . . . Rear-view mirror . . . Fisk full-size balloon tires . . . Long, flexible Chrome Vanadium Springs especially built for balloon tire equipment . . . every last feature and convenience . . . *Do you wonder it has taken the factory 9 months to catch up on production when such a magnificently-equipped car as this is priced at only $895!*

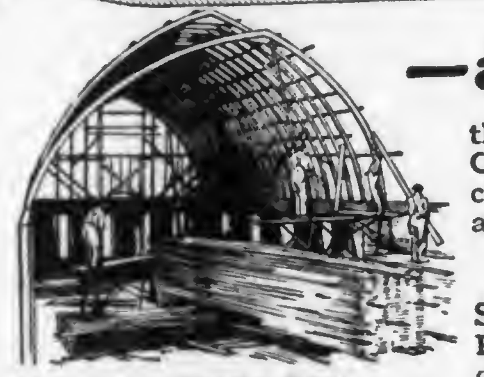
Get Our NEW FREE BOOK Before You Buy

If you are thinking of building, remodeling, ventilating or buying anything in the line of equipment for your cow or horse barn, hog or poultry houses, then by all means get this book before you buy. It will save you a lot of money and give you a lot of valuable pointers on just what equipment will be best suited to your purpose. This Free book tells all about the Jamesway line of Equipment, Plans and Ventilation for cow and horse barns, hog and poultry houses and why they are better and cheaper. It also explains how the local Jamesway Service Man not only SAVES you a lot of money, but gives you much valuable help and the benefit of experiences, which these men have gained in helping hundreds of farmers work out their equipping and building projects. This Service is an advantage of vast importance.

MAIL Coupon NOW Your name and address sent to us on coupon below will bring you this valuable money-saving book by return mail free and postpaid. Send coupon to our office nearest you. Do it NOW.

(4)



Lower Lumber Costs
Jamesway Plans and Specifications will SAVE you big money on lumber costs. Our Jamesway book shows how—gives you actual figures in dollars and cents. Send for it and state what you are interested in—horse barn—hog barn—cow barn or poultry house.

—and as President of the Jamesway Company, I want to personally tell you why. FIRST—through our extensive experience in making hundreds of PLANS, equipping and ventilating thousands of Cow Barns, Horse Barns, Hog Houses, Poultry Houses and Complete Farmsteads—all over the United States, naturally we have come to KNOW HOW to plan and equip and ventilate barns better and at far LESS COST. That's one way JAMESWAY COSTS LESS.

Jamesway PLANS Save You Money

SECOND—You will be greatly surprised how much money Jamesway Plans will SAVE you in lumber, alone, often amounting to several hundred dollars. Jamesway plans will SAVE you many costly mistakes, too. This is very important, because if doors, posts, feed rooms, windows, and the general arrangement is wrongly placed, you have a building that is costing you money every day, instead of making you money every day. That's another way JAMESWAY COSTS LESS.

Jamesway EQUIPMENT Saves You Money

THIRD—Here again, our extensive experience in designing and building equipment and ventilation for poultry houses, hog houses, cow barns, etc., enables us to put out BETTER designed—MORE practical—LONGER lasting, more sanitary equipment for the cow, the horse, the hogs and the hens. Being so much BETTER made, they last much longer. Being BETTER designed, they do the work better—save you more time—give your stock greater comfort and make more money for you. That's why JAMESWAY COSTS LESS and over a period of years it means a vast amount of money saved for you.

Money Saving Plans
The Jamesway Service Man in your locality will give you PERSONAL help that will cut building, remodeling or equipment costs considerably. He is as familiar with poultry house construction as with hog barn or cow barn building problems.

Jamesway VENTILATION Saves Money

FOURTH—By all means, do not overlook the matter of ventilation, whether it be for the hog house, poultry house, the horse or cow barn. If you do you will surely regret it. It will be damp, cold, foul, or disease-breeding. It will take money out of your pocket every day and it may take it at a frightful cost. It takes EXPERTS to correctly design a ventilation system that will ventilate a building properly. We have them, and in this, again JAMESWAY SAVES you money, and makes JAMESWAY COST LESS.

Still Another JAMESWAY Saving

In addition, we have built up a PERSONAL Service to Jamesway buyers, through our Jamesway Service Men, one of whom is no doubt near you, ready to help you in any building, remodeling or equipping problem you may have. It is a service which SAVES money, time and costly mistakes, also aids in getting lower bids on building work. Here's proof:—

"I believe the first five minutes your Jamesway man, Mr Calhoun, talked to us, he SAVED us at least $500 in construction costs by a single suggestion."—Lee Boyce, Brookfield, Mass.

You Buy Direct From Factory to Farm

This is another reason Jamesway COSTS LESS. You buy direct from our factory through our Special Jamesway representative, who is a trained equipment man. I cannot tell you in this one Ad all the reasons for Jamesway leadership in the barn equipment field and why our business has grown to its enormous size and prestige, so I ask you to

Send For This Valuable Book

It is 8x11—has 128 pages, stiff bound cover, and is full of "Proofs" in the form of letters from users telling why they selected Jamesway equipment in preference to any other. It shows how Jamesway SAVES you money in building, remodeling, equipping your barns. It is free—send for a copy today. It will interest you, even if you are not ready just now for such equipment. W. D. JAMES, President

Saves Labor—Time
Jamesway Equipment gives your cows, hogs and hens greater comfort, and SAVES owners the most time and labor, because it is BETTER designed, handier, more practical. Built of BETTER material it lasts longer, therefore much more economical to buy.

Harvest Time in the Penna. Grape Belt

This Erie County Cooperative Association Markets Perishables by the Trainload

By C. L. WHITE, Associate Editor

THE Keystone Cooperative Grape Association, of Erie County, Pennsylvania, has been called the most successful farmers' cooperative organization in the state.

Three facts are offered as evidence that this organization is unusually successful: First, its members are satisfied with the way the business is run by the officers; second, the buyers of its products are satisfied that they have been treated fairly; third, savings of $49,500 have been accumulated in four years, mostly from economies in operation.

It was a bright October morning, in the middle of the grape picking season, when we visited the headquarters of the association in the town of North East.

We had spent the previous night in Jamestown, New York, and had driven that morning along beautiful Lake Chautauqua, half hidden in the fog, to Westfield. Turning west from there, along the shore of Lake Erie, we had soon realized we were in the grape country. We had passed wagonloads of grapes, scores of them. All were headed toward one of the great grape juice plants at Westfield we learned later.

Crossing the state line into that projecting corner of Pennsylvania that stands out so prominently on the map, we had seen great vineyards, some occupied by busy pickers, and others dotted with white baskets inverted over the tops of the grape vine stakes, waiting to be filled.

Sold 500 Carloads in Fourteen Days

Only fourteen days of the grape shipping season had passed when we arrived at the association's offices in North East that morning. But in those fourteen days the Keystone Cooperative Grape Association had loaded and sold 500 carloads of grapes. Beside these, as we learned from the manager, Mr. H. H. Meyer, the members had hauled the equivalent of 150 carloads to a grape juice plant at North East.

Let us try to get an idea of what it means to be in charge of a marketing project like this one. Suppose we put ourselves in the shoes of the manager of this organization for a little while.

Here we are in a room with two or three chairs, and a big flat-topped desk with two telephones. One of the telephones rings. It is the man in charge of one of the ten loading stations where grapes are being loaded into railroad cars from motor trucks. He tells us that he has just finished loading two cars. We take down the initials and numbers of the cars on a chart prepared for the purpose.

We ask the loader how they are coming, and he reports that he will probably have two or three more cars filled before night. That is not welcome news, for there are nine other stations just as busy piling the baskets away in the refrigerator cars, and no one is very anxious to buy those grapes.

It is now noon. The loading reports continue to come in. We know that we shall have forty cars on the sidings before night. We know, too that we shall have to sell those grapes before night, for there will be another forty cars loaded tomorrow.

We call up a good customer 200 miles away on the long distance telephone. He tells us that grapes are going very slowly. People seem to be "fed up" on them. He cannot handle any more unless the price goes down. He is afraid that he will have to sell his last carload for less than he paid us, or they may spoil on his hands. We don't like to see him in a fix like that; we would like to reduce our prices enough to start people buying. But, this is a producers' organization. What will the growers think about receiving low prices?

Now it is two o'clock. We have thirty cars we should sell before night. Nobody wants them at our figure and we cannot cut our price without causing great loss to our growers. What shall we do?

Loading grapes into refrigerator cars at North East, Pennsylvania.

Thirty cars of grapes. Two hours until the markets close. Nobody wants grapes. What shall we do?

We are sure we wouldn't know what to do in such a case, but H. H. Meyer, manager of the Keystone Cooperative Grape Association, does know what to do, and that is one of the main reasons why this organization is considered a model of what a cooperative can be.

These baskets will soon be carrying Concord grapes to city buyers.

Mr. Meyer was in just such a dilemma when we called at his office this Wednesday noon. He had about forty cars of grapes that were being loaded that day, and buyers weren't anxious to take them off his hands.

Whether Mr. Meyer has been in such difficult situations so often that he has gotten used to them, or whether he is too good an actor to show his worries, we don't know. But certainly he didn't appear troubled as we discussed the organization and its ways of doing business over the dinner table.

Perhaps one cause for his not worrying was his thoro knowledge of the market. He spends over a month each year visiting prospective buyers, so he is not "up against it" even if a few of his prize customers go back on him. He knows where to find more. And the grapes are all sold under a distinctive label. People who bought Keystone grapes last year know where to look for more of the same kind.

With the aid of the long distance telephone and the telegraph, Mr. Meyer can keep in close touch with the situation everywhere in his territory. If his dealer in one town has all the grapes he can use, he telephones or telegraphs to another town, and another and another, until he has found buyers.

If heavy shipments by competitors, or some other reasons make it impossible to sell all the grapes on hand without "knocking the bottom out of the market," the cars are held for a day or two until there is a good opening for them. This can be done safely, for the grapes are all in refrigerator cars, which are really cold storage plants on wheels.

After dinner we left Mr. Meyer in his office while we went on a little side trip with J. F. Bimber. One of Mr. Bimber's duties is to manage the cooperative's basket factory that makes more than three-quarters of a million baskets a year. He took us out to a farm near the lake to see Charles H. Haye, then the president of the organization.

Mr. Hays told us some more about the workings of the association and its history, tracing it back to the old Keystone Grape Company from which the present organization grew.

The idea of cooperative effort isn't new to these Erie County grape growers. Back in 1896 they organized, with other growers across the line in New York, the first farmer-owned selling agency. In 1901 the acreage of grapes in Erie County had increased so much that the growers there decided they should have an organization of their own. The result of this decision was the organization of the Keystone Grape Company, chartered under the corporation law of Pennsylvania. Altho this company was a stock corporation, it was, in spirit and intent, a cooperative. The law at that time made no provision for non-stock corporations.

Organized under New Cooperative Law

In 1921 the Keystone Cooperative Grape Association was organized under the new Pennsylvania cooperative law. Mr. Hays gave P. R. Taylor, head of the State Bureau of Markets, and S. S. Lehman, then county agent in Erie County, a large part of the credit for the formation of the new organization. The Keystone Grape Company had operated successfully for twenty years and had built up good will among buyers that was of inestimable value to its successor.

The growers changed from the stock company to the cooperative form of organization with as little shifting of officers as possible. D. C. Bostwick, who had been president of the company, became chairman of the board of directors of the cooperative. Upon the retirement of Mr. Hays last winter Mr. Bostwick took his place as president. The whole board of directors of the old company was drafted into the new organization, the five of them, together with seven others, making up the directorate of the cooperative association.

The cooperative took over the real estate of the Keystone Grape Company which (to page 33)

The Spiral Bedspring that Supports the Spine

CAMBRIA FENCE

It will soon be fencing time

During these winter months you are undoubtedly planning to fence in more property in the spring. Before you buy fence, we want you to look into the features of Cambria Fence. It combines in one all of the essential points a good fence should have, namely:

A Hinge Joint Cut Stay Fence

—a zinc coating that actually protects against rust.
—a fence that will stretch evenly and stay tight.
—a cut stay, hinge joint fence that will conform to the contour of the ground.
—a fence that will retain its neatness and newness throughout the years to come.

Cambria Fence is tried and proven—a product manufactured in the oldest steel-making plant in the United States.

NESHAMINY GARDENS

Where an Editor Works and Thinks

By R. P. KESTER

WHO in your family has the best ideas about how the home and grounds should look and does she have full cooperation in improving them? There may be an implication in the way that question is asked that the wife is the one who plans and plants the home grounds if it's done at all. If so, it is because my observation teaches me that that is the case in nine cases out of ten. Why is it that the average farmer thinks it effiminate or small business for him to be seen "pottering" about fixing up the "yard?" I have heard men apologize to visitors for the attractive appearance of the home grounds by saying, "It's some of the women's doin's."

* * *

IN THE minds of this class of farmers, a lawn is something for the town home or rich man only. The term lawn in the average farmer's mind is a "door yard" on which the owner has time and money to waste (?). He sees nothing incongruous in the growth of weeds and the absence of flowers, or the broken fences and lack of shade. Usually, when pressed on the subject, he will give as an excuse, "I never have any time to do any fixing up." In nine cases out of ten that is not true. The real reason is he lacks a sense of appreciation of the beautiful, or else is too indolent to help create it.

* * *

THESE may be thought hard words. Maybe they are, but I want to "get under the skin" or a class of farm home owners I have seen. No other class of homes in the world has the natural opportunities for easy adornment as have farm homes. A little time and labor, and a little thoughtful planning will soon convert a very ordinary place into an attractive, cheery and lovable home. The best known home in the world, that of John Howard Payne, was only a thatched cottage but it had moonbeams shining on it and vines over the door. I have no doubt that the beloved mother of the wanderer had flowers growing also wherever there was room to plant them.

THE essentials to attractiveness in a home grounds are, a smooth green sod, some shade trees, somo ornamental shrubs, and some well placed flowers. These three factors admit of infinite variation in planning and setting,—excepting the sod, which is fixed in its character. While the finest condition in a lawn sod requires years to develop, it will be beautiful in a few weeks if properly done. The best plan is to prepare the soil early in the spring and keep it well raked and cultivated to remove stone and kill weeds. Then, about August 15 sow heavily with the best lawn grass seed you can buy. Begin clipping as soon as it is two inches high, and thereafter as long as it needs it.

* * *

WE PUBLISHED the first of a short series of articles on planting the home grounds. The author who has made a special study of the easy adornment of farm homes will follow this with others and we are sure they will aid many in choosing the right material. It is necessary for one to form a mental picture of what he wishes the place to look like years hence. Too many make the mistake of placing large-growing trees too near the buildings. While evergreens have a proper place, they should not be so numerous as to dominate the appearance. It is a good plan to look at many pictures of planted places, or, what is better yet, take a trip in the automobile and pay special attention to the home grounds seen. You will learn what not to do as well as what is pleasing.

Ham—Last night I went home and got San Francisco on a one-tube set.

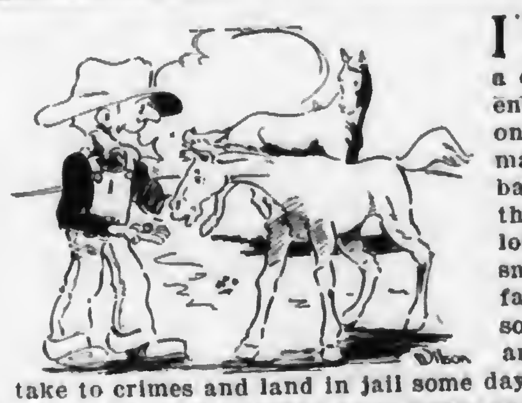
Ham and—That's nothing. I went home last night and got Greece on my vest.

Mistress—Why have you put two hot water bottles in my bed, Bridget?

Bridget—Sure, mum, wan of thim was leaking, and I didn't know which, so I put both in to make sure. —Punch.

THE CHEERFUL PLOWMAN

The Only Child



I'VE often heard the "only child" is seldom made to mind, that such a one runs loose and wild with parents acting blind; I've heard it said on every hand the normal paw and maw take guff and sass to beat the band without recourse to law, when there is in the family herd just one lone little scamp,—they take with smiles the naughty word without a facial cramp! I've heard this said so many times, I've heard folks grin and say, "That pampered brat will take to crimes and land in jail some day; but then, he is an only child, his parents can not see that he is mean, and cross, and wild, and saucy as can be!" "He should be made to toe the mark!" I've heard stern neighbors cry, "that little rascal's heart is dark, the devil's in his eye; but then he is the only kid that those good people own; his evil ways from them are hid, because he is alone!"

Now, here is Gyp with coltie Bess; Bess is the only girl,—there's not a brother here to bless or tease the little pearl,—but is she spoiled? I'll say she's not! A lady thru and thru, she's conscientious to the dot and does as she should do! Her mother spoils her? No, by jove, her mother uses brains! She teaches her beneath the groves and on the treeless lanes; she teaches her in barn and stall the lessons she should get, and doesn't baby her at all nor treat her as a pet! She brings her up with love and care as mothers always do, no doubt she uses law and prayer, and tells her who is who, but no erratic flights and spurts, no saucy words, I know, no thought that blossoms out and hurts, does she permit to grow!—J. Edw. Tufft.

OIL SPECIFICATIONS

Lubricating Value Is Not Always Indicated by the Ordinary Tests

NO DOUBT every reader of this article has heard from time to time various terms applied to oil which means practically nothing to him. I refer to such terms as "flash point," "fire point," "viscosity," "pour test" and similar terms. These terms are simply a tabulation of the physical characteristics of an oil and may not be, in the slightest degree, a measure of the oil's lubricating value.

The various physical tests usually applied to oil are as follows:

First, "specific gravity" which is merely the weight of oil as compared to the weight of the same volume of water. This test is sometimes taken as an indication of the type of crude from which the oil is refined, but is not a true guide because oils of different viscosities made from the same crude may have different specific gravities.

The Meaning of Viscosity

The second is known as "viscosity" and is usually quoted at two or three different temperatures. Viscosity is simply the technical name for "fluidity" and the figures applied to a viscosity reading simply denote the number of seconds at which a certain quantity of an oil will flow thru a certain-sized orifice at a given temperature.

The third test is usually called the "flash point" and is simply the temperature at which oil will ignite and immediately go out when a flame is swept across its surface.

The fourth is known as the "fire test" or the temperature at which an oil will ignite and continue to burn.

The fifth specification is called the "pour point" or "cold test," or the temperature at which oil ceases to flow from a certain shaped container in a given time.

The next most important specification is called the "carbon residue test" which is the percentage of carbon remaining when an oil is evaporated to dryness in an open crucible.

The above tests are made use of by refiners only in checking different lots of the same grade to assure themselves of a certain degree of uniformity and are of no further value to the user even if he had the necessary instruments and laboratory to conduct the tests. A lubricating oil's value lies alone in its ability to lubricate efficiently.

If the Public Knew

If the oil buying public realized that it is possible to take ordinary molasses and by mixing it with certain other ingredients, such as alcohol, paraffin and coloring matter, produce a substance which has practically all of the physical characteristics of a high-grade lubricating oil, they would pay less attention to oil specifications.

I know of one refiner who makes two oils of identical physical characteristics, one of which is a high-grade automobile engine lubricant and the other is used for certain processes in the tanning of leather.

To protect yourself, do not buy oil from specifications alone. Assuro yourself that the oil has a certain definite lubricating value which has been determined by experience in service, and further protect yourself by buying oil of the highest grades made by the largest and best known refiners. It has been definitely proven that the difference between the cost of correct lubrication and incorrect lubrication is at the most but eight or ten dollars per year,—which will not nearly cover the cost of a burned out bearing or a scored cylinder block.—E. B. Hine, Automotive Engineer.

ATWATER KENT RADIO

"California is just one trip
but Radio takes you on hundreds"

EVERY WINTER it had been the custom of a farmer living near Galesburg, Illinois, to go to California.

Last winter he was unable to go. Instead, he bought an Atwater Kent Receiving Set. Now he tells us:

"My wife and I hardly missed the trip. There were so many interesting things coming out of the air that it was no trouble at all to keep ourselves entertained. My wife summed it up when she said:

"'California is just one trip, but Radio takes you on hundreds.'

"When I studied the radio reports showing all the forces at work to shove prices up or down, it gave me so much to think about that at the end of the winter I was a better farmer.

"I was more tolerant, too. Why, I got to listening to the services of a church which wasn't the one I was brought up in, and I tell you it was a revelation! I had supposed those people had horns, but they haven't."

Radio is indeed a godsend to any home, and doubly so to the home of the farmer. But be sure that the instruments upon which you depend to put you into touch with the world are *good* instruments. Don't get your impressions of Radio from inferior receiving sets and speakers.

Look for all-round performance, for reliability, for simplicity and ease of operation. And for a set and speaker that will make a good appearance in your home.

Atwater Kent Radio is so well built, so simple, so dependable and so good looking that it is known among dealers as "the Radio that sells itself and stays sold."

The Atwater Kent dealer nearest you will be glad to give you a demonstration.

• • • • •

What a country banker says

"The ownership of a radio set today is a better indication of intelligence than the ownership of any other piece of equipment on the farm. Every farmer who owns a radio set can hardly help becoming well posted on markets and prices, and making more money. And the smart farmers know it."

"What you can live thru and still smile and fight on is the test of the stuff of which you are made."

Size of Farm Families

THE figures of the triennial farm census in Pennsylvania show that the average farm family contains about four and one-fourth persons,—4.27 to be exact. Thus it is seen that the farm population is barely holding its own and that there is little danger of greatly increasing the number of farmers in the state at present. Of course, these figures show only the number actually living on the farm at the time the census was taken and do not take into account the number who may have been born and raised on the farm and have later gone into towns and cities. It would be interesting to know what such a count would show. We feel sure, however, that the average farm parents have more than two and one-fourth children, even tho the number is much less than it was fifty or one hundred years ago. The census shows a variation in numbers from 3.36 in Delaware County, the lowest, to 5.5 in Cambria County, the highest.

Coal Strike Settled

THE anthracite coal strike was settled in Philadelphia on Lincoln's birthday. There seems to be nothing in the terms of settlement that might not have been agreed upon at the first meeting last fall. The contract is for five years with wages at the present level, with provisions for opening negotiations within the industry whenever either side desires a reopening. The question of the check-off seems to be about where it was in the beginning. The matter of arbitration seems to have been laid aside.

So, after nearly six months of suspension, during which miners have been without any income, the operators have lost immense trade and the general public has suffered in a number of ways, the mines will reopen at once, but without any progress having been made towards establishing the coal business upon a secure basis so far as the public is concerned.

Now, we may expect to hear much talk of a political nature in relation to the settlement. Politicians will endeavor to make capital for some and ruin the chances of others. The fact that Pennsylvania will elect a United States senator and a governor next year causes every public question to be handled on the basis of expediency rather than fact. As a matter of fact, necessity may be credited with having had more to do with the settlement of the coal strike than anything that any individual did.

Be Sure of Your Seed

WE KNOW of nothing that will better repay the time spent than the testing of seed to find out its germinating ability. A great deal has been said and printed, urging the testing of seed corn and a great many people practice it with more or less efficiency, but other seed is in the great majority of cases planted without any knowledge as to whether it will grow or not. This is especially true of garden seed. Thousands of gardeners are disappointed after their arduous labors in preparing their gardens by finding their seed did not come up. The tests made by the New York Experiment Station last year showed that a great deal of the cheap seed was purchased in chain stores. In some cases none germinated. Many seedsmen make careful tests and stand back of their seed, thus making an honest effort to give full value. Cheapness is not always a recommendation since seed that will not germinate is the dearest kind you can buy.

Buying Below Cost

THERE seems to be a universal inclination in mankind to feel that they have done a smart thing when they buy something for less than it cost. They seem to feel that they have been "lucky," or that the purchase shows them to be exceptionally shrewd buyers. So well known is this trait of human nature that many stores invariably use two sets of figures in advertising their goods,—one telling what the article is worth (usually a fictitious price), and the other stating what it is being sold for. Old as is this practice, it still seems to work.

As a matter of fact, there is a tinge of unrecognized dishonesty in a desire to get something for less than it cost to produce it. This holds true whether one is buying a dozen eggs or a suit of clothes. If a manufacturer sells below cost it means that the materials he uses are bought below cost, or that they will not be paid for at all. It means that the workmen are getting scanty wages, or will soon be out of work for the manufacturer will eventually go bankrupt. If the city man buys his eggs, meat, apples, bread, etc., for less than it cost to raise these products, it means impoverishment of the farmer. It means that farmers cannot buy manufactured articles and pay taxes by which the public institutions of his community are kept up. Buying below cost is getting something for nothing and taking the results of other men's work for which no compensation is returned. It is not only unfair, it is dishonest.

We Dare Not Print It

THE following question is asked us by a reader in Greene County, Pennsylvania.

"What do you think of an attorney who will defend in open court a bootlegger and try in every way to twist his points to clear the bootlegger from just punishement? Is he a loyal American and a supporter of the Constitution?"

The license which attorneys in America are permitted to have in conducting a defense is a disgrace to the profession and is something not permitted in other countries, we are told. A defendant has the right to a fair trial and he has a right to have a representative before the court, but when that representative, by hook and crook, is allowed to prevent the carrying out of the law it is time to call a halt. So notorious has become the miscarriage of justice and so uncertain the results before the courts there is good ground for believing that crime is fostered thereby. The questions which the inquirer raises are not confined to bootlegging cases. Trials for murder and other crimes have become largely battles of wits between attorneys, and the most conclusive evidence is not sure to result in conviction. However, there are many good conscientious lawyers who will not take cases requiring such methods, and who deprecate the fact that others do. This is as far as we care to go in stating our views of such tactics and such tacticians.

Don't Expand This Year

THE information gathered by the United States Department of Agriculture prompts the officials to warn against any agricultural expansion this year. Some of the reasons given are as follows:

There is little likelihood of increased demand for farm products either at home or abroad.

No reduction in farm wages may be expected. Farm necessity prices will be about the same as last year. Credit funds will be ample and at previous rates.

While a slightly smaller world crop of wheat is indicated there is enough carry-over to prevent any sign of shortage, and if the same amount of spring wheat is planted as last year and average yields are secured, the export and the domestic price will be more nearly what the world price is now.

Last year's corn acreage with average yields will produce sufficient corn, and an oats crop the same as last year will continue the low price.

The outlook for the livestock industry is good. The decreased number of beef cattle, sheep and swine indicates the possibility of rising prices all along the line. Normal breeding would seem to be wise under these conditions.

The dairy business is in a strong position, but should the present trend in foreign production continue without a corresponding foreign consumption, sharp competition from foreign countries may become an important factor.

While no figures showing intention-to-plant prospects are yet available, the possibilities are that the late potato states may be inclined to plant too heavily because of the abnormal prices now obtaining.

It is well to note all these factors, but the eastern farmer has little close calculating to do in any of these lines. His acreage, his markets and his diversity of production, together with the fact of big markets close at hand, make his problem chiefly one of working out a well balanced, economical producing system.

Washington Letter

BUTTER TARIFF AGITATION.—A resolution has been introduced in the Senate directing the Federal Tariff Commission to submit its report in the butter tariff case, and providing for a congressional investigation of the methods used by the commission in making its inquiry. This is the outcome of a resolution adopted by the board of directors of the National Board of Farm Organizations demanding the abolition of the United States Tariff Commission.

It is declared by the National Board's spokesmen that "delay in the butter tariff case has caused the loss of millions of dollars to American farmers." This statement is regarded as somewhat overdrawn by friends of the commission, when it is known that the total imports of butter during the year ending December 31, 1925, amounted to 7,212,000 pounds. This was only 1,869,000 pounds more than the exports of butter during the same period.

MORE OLEO BEING SOLD.—While we imported around 7,000,000 pounds of foreign butter, the oleomargarine manufacturers of the United States in 1925 produced and sold 237,273,000 pounds of oleomargarine as compared with 229,873,000 pounds the year before. It is held by dairy organization representatives that this vast increase in oleomargarine production is to a far greater extent responsible for the unsatisfactory butter prices than is the failure of the tariff commission to act upon the tariff rate.

NATIONAL AGRICULTURAL DAY.—The plan of having a national agricultural day established by congressional enactment, which was first proposed by the National Grange, is attracting considerable attention. It has received the endorsement of all the farm organizations. Congressman John C. Ketcham, of Michigan, and Senator Arthur Capper will introduce bills to put this idea into operation. Agricultural day is designed to call to public attention the importance of the farming industry, and the necessity for a better understanding by the public of the problems of agriculture, which affect all the people.

TO FIGHT FOR SURPLUS LEGISLATION.—The mid-western promoters of the Dickinson surplus disposal bill are planning to open headquarters in Washington. It is announced that a meeting will be held in Washington on March 1, attended by agricultural leaders from many states, at which plans will be perfected for an aggressive campaign for the enactment of surplus disposal legislation.—E. E. Reynolds.

Harrisburg Letter

THE SPECIAL SESSION.—The special session of Pennsylvania's legislature will close this week with little accomplished at a series of intermittent meetings, but much to explain. The great bulk of the proposals made to it have been held in committee and what did get the favor of either house was only after battles and in many cases close votes. Opponents of Governor Pinchot played into his hands in a number of instances and on the other hand the Governor sent in measures like Giant Power which never had anything like a chance to get by. The session came too close to the opening of the spring primary campaign for comfort of many legislators aspiring to renomination. The cost for pay and expenses of members and attaches alone runs over a quarter of a million dollars. The book of acts will be small, but the reports of debates will be large.

TO SUBMIT POWER AGAIN.—It is expected the Governor will bring rather forcibly to attention of the next legislature the power legislative program together with other subjects failing to get anywhere this session. Under the constitution the retiring governor communicates his ideas to a legislature when it assembles, which are generally lost sight of when the incoming governor makes his inaugural address. The Public Service Commission is still holding up decision on the application for a rehearing on the rural power regulations.

WORKING ON CROP ESTIMATES. The statistical branch of the State Department of Agriculture is working on a series of estimates of production of staple crops in Pennsylvania to be issued shortly. Considerable attention has been atracted by the results of analysis of the size of farm families in Pennsylvania because northern tier counties, standing high in agriculture, indicate a decline in children while southern tier counties hold their own in many instances.

TESTING GOING RIGHT ON.—Tests of cattle for tuberculosis are going ahead on area bases in many of the counties of the state this winter and the outlay in indemnities has been heavy. The number of cattle under supervision breaks all records.

DETAILED MARKET STUDIES.—Probably more information than ever assembled before at the Capitol on local supplies for city and large borough markets is now being put out by the State Bureau of Markets. Every statement is a hint for cultivation of the local market.—Hamilton, Harrisburg.

New Jersey Letter

APPROVE CENTRALIZING PLAN.—Ten farmer organizations in New Jersey have now signified their general approval of the plan, proposed by the New Jersey Federation of County Boards of Agriculture, for centralizing the efforts of all state farm organizations thru a general headquarters at Trenton. The ten associations have appointed committees to meet in Trenton in late February to develop ways and means to put into operation such a centralizing plan. A tentative constitution and by-laws for the central body have been prepared and will be considered at the joint meeting of the committees.

UNIFORM TRAFFIC LIGHT BILL.—A measure has been introduced in the Legislature which would provide a uniform system of lights and signals to be used in traffic regulation, making the measure mandatory upon the various cities and towns. It is claimed that lack of uniformity has resulted, not only in the breaking of traffic regulations with resulting consequences, but in a menace to life and property.

FARM LOAN MEETINGS.—The eighteen local national Farm Loan Associations in New Jersey have been holding annual meetings thruout the state in recent weeks. One of the more recent meetings, that of the Somerville local, showed that the organization had loaned over half a million to Somerset County farmers. Officers of the Somerville association for 1926 are: Clifford T. Darby, president; Frank W. Meeker, vice president, and Robert W. Hanna, secretary-treasurer. These three, together with Benjamin L. Totten and N. P. Jensen, comprise the Board of Directors.

FORMAL BRIDGE OPENING.—July 4 has been set as the date for the formal opening of the Camden-Philadelphia bridge. This affair thruout South Jersey will be one of the most generally recognized events of the year. Farmers in Camden, Salem, Cumberland, Gloucester and Burlington Counties actively backed the bridge project since its inception. They have stood firmly for the collection of tolls to amortize the cost of construction. The Mayors of twenty-one Camdens in twenty-one different states have been invited to join in the celebration.—B.

New York Letter

DEATH OF DAIRY EXPERT.—The dairy industry of the state has suffered a great loss in the death of Prof. W. A. Stocking, who was a member of the dairy staff at Cornell for twenty years, and who was largely instrumental in establishing it in its present high position. He had given much time to original research work in dairy bacteriology and met his death at a premature age thru an infection that induced a heart difficulty, in his work with bacteria. He had led the farmers as president of the state dairy association from 1922 to 1924. His "Manual of Milk Products" is a text book in most agricultural schools and colleges of the country. He leaves a widow and four children, one a student in the University of Montana. He represented the American dairy industry at Milan, Italy, at the International Dairy Congress and later studied European dairy conditions.

PROFESSORS IN FIVE COLLEGES ENROLL FOR HOME STUDY.—Faculty members of colleges of other states are asking for the new marketing course offered to New York state farmers thru Cornell College of Agriculture. This is a pioneer work and the field is big. The course consists of fifteen lessons.—M. G. Feint.

Don't neglect a Cold
Dangerous sickness often starts with a cold. Ward off your colds with Musterole before pneumonia starts.
Musterole is a clean, white ointment made with oil of mustard. It has all the healing properties of the old-fashioned mustard plaster without the blister.
At the first sneeze take Musterole from the bathroom shelf and rub the ointment gently over congested spot.
It penetrates the skin and goes right down to the seat of the trouble.
Rheumatism, tonsillitis, lumbago, coughs and colds are all symptoms that call for Musterole.
To Mothers: Musterole is also made in milder form for babies and small children. Ask for Children's Musterole.

He Wants You to Know

FINDING great advantage in being able to plow at the rate of eight to ten acres per day, a Case tractor owner wrote: *"I am telling you this because I do not believe the average farmer knows how much a tractor like mine will save in hired help and in the cost of doing so much work in a short time."*

Case tractor owners have every advantage. Their machines are simple, easy to handle, thrifty in operation and upkeep, adapted to both drawbar and belt work. Their fields can be plowed and crops planted on time. Harvesting, threshing and all other field and belt work can be handled quickly and cheaply.

The saving in power and labor costs made by a Case tractor is a desirable addition to any farmer's income. There are three sizes: 12-20, 18-32, 25-45. Let us send you information to help you choose the best size for your work.

Established 1842

The tractor that does the most work, season after season, for the longest time, makes the best investment. Ask any Case owner for his work and cost records.

Garden and Truck Crops

Worms Eat Carrots

Last summer my carrots turned a rusty color and did not grow very well. Now the carrots are being eaten full of small holes by a white or yellowish worm about three-eighths of an inch long. They have practically ruined five bushels. The carrots are stored in barrels in the cellar. It appears to be the carrot rust fly as described in the book, Insect Pests of Farm, Garden and Orchard, by Sanderson and Plairs. Is there anything that can be done to stop them?—W. E., Tioga County, Pa.

I believe you have already named the insect which is damaging your carrots. Your description of the worm and appearance of carrot indicate that it is the carrot rust-fly.

The Life of the Insect

The parent insect is a small two-winged fly, usually appearing in May. Eggs are laid near the carrot plant and the young maggot works its way down along the root. The maggots become mature in about one month and are pale straw-colored. The mouth has a pair of black, curved hooks, with which the maggot is able to rasp off portions of the tissue of the root.

After maturity, the maggot transforms to puparia, light brown, resembling a grain of wheat. In August, a second brood of flies appears, lays eggs and hatches into more maggots. Often the second crop of maggots is large enough to cause severe damage to late carrots in the field and in storage, and this is apparently what has ruined your stored carrots.

So far as I know there is no remedy. The insects hibernate or pass the winter either as puparia in the soil or as maggots in the roots. All infected roots should be destroyed, and it might help if carrots were not planted on the same ground or near the old patch for a season.—W. T. Tapley.

Berry Bush Cuttings

CUTTINGS may be made from vigorous healthy currant or gooseberry bushes any time during fall, winter, or early spring. If made during the spring, care must be taken to see that the plants from which cuttings are taken are still perfectly dormant. The lower and middle portions of vigorous, one-year-old wood should be cut into lengths of six or eight inches.

The cuttings are then tied in bundles of fifty with the bases of the cuttings all pointing the same way. These bundles should then be buried upside down in light, well drained soil, and completely covered in such a way that there will be two or three inches of soil over the ends of the bundles. The base of the cuttings will begin to callus two or three weeks after they are buried. If the ground is frozen, the cuttings may be stored in a cool place in sand or soil which must be kept moist until they can be buried outside.

When the Soil Becomes Tillable

As soon as the soil is in a tillable condition in spring the cuttings may be planted six inches apart in the nursery row. The depth of planting should be such that only one or two buds are above the surface of the ground.

Where only one or two additional plants are desired, they may easily be secured by layering, which consists of bending some of the side branches down to the ground, and covering them with a small mound of soil until roots are formed.—New Jersey State College of Agriculture.

Early Cabbage Varieties

WHEN winter cabbage sells well there is added interest in early cabbage. Northern markets are already receiving early domestic type cabbage from south Texas and from Florida. Early cabbage from the South is marketed from January to July, and nearly all is of the early-maturing domestic type. According to shape it is known as flat, such as Flat Dutch, or pointed, such as the Wakefield and the Winningstadt, a somewhat later maturing variety; or round, such as Copenhagen Market.

The pointed cabbage is a market favorite because of its early maturity, its convenient size for family requirements, and the ease with which it may be packed in hampers used for early shipment.

Where Most of Early Crop Is Grown

Florida, Texas, South Carolina, Virginia and California, in the order mentioned, produce about five-sixths of the early cabbage crop. Florida and Texas have the market pretty much to themselves until April, then South Carolina, Alabama, Virginia, and Mississippi compete with the late shipments from Florida and Texas. Virginia is about the only state shipping in quantity during June. California ships a rather uniform quantity, from February to May the total amount being from 600 to 1000 carloads.

Where does the local market gardener and farmer find a market with these southern states shipping an average of over 2500 carloads a month from January to May? A half-way regular sleuth about February 1 could find evidence in many a northern greenhouse or hotbed yard that certain farmers were figuring on growing early cabbage just as tho they never heard of the land of perpetual sunshine and balmy breezes. Look again to the figures.

Least Amount Shipped in July

It is seen that during June only about 1500 carloads are shipped and that July is the leanest month for the railroads depending on cabbage to fill cars. Early cabbage in the north means home grown early cabbage ready to cut from the middle of June, on. It is a good crop to grow and many a truckload is sold in our markets every morning.

The one quality which causes one variety to be favored over another is earliness. Early cabbage is the first seed to be planted, the hardiest plants to set in the field, one of the first of the money crops to come in. It is true that some of the early greens, bunching crops and asparagus, have had their run on the market, but there is real pleasure in cutting and marketing early cabbage; if it is early. Growers readily change from one strain of variety to another if they believe the new will be ready to cut a few days earlier than the old.

Jersey Wakefield, was introduced into this country by Francis Brill, of New Jersey, about 1850. For many years it was grown only by himself and neighboring gardeners. Since these men also grew other varieties of cabbage for seed the original Wakefield became mixed. Our present stocks have been selected from this hybrid seed.

This variety was introduced to the trade in 1868. It immediately became popular and has continued to be the leading variety grown for early use. Heads of Jersey Wakefield should be of medium size, averaging about one pound, ten ounces, with an angular shape, sharply inclined to a point. About ninety days are required to produce a mature head. The ideal color should be a uniform light green, outer leaves few and head when mature solid and crisp, quality extra fine, the pointed types being sweeter and tenderer than the rounded sorts.

The Charleston Wakefield

Charleston Wakefield was selected from a larger type of Wakefield; it takes about five days longer to reach maturity; in general the shape is thicker thru and not so sharply pointed.

Copenhagen Market was introduced in 1911. It is of Danish origin, being a hybrid of Danish Summer Ballhead. This variety has been grown in this country only fourteen years but in that time it has become immensely popular with market gardeners thruout the country.

The head is of medium size, globular, flattened, horizontal cross-section round; plant medium size, short stem, leaves few in number and enclose the head loosely; color dark green with considerable bloom; usually matures in about 105 days, or two weeks later than Jersey Wakefield; heads should average from two to three pounds each.

Golden Acre Recently Introduced

Golden Acre, which was only recently introduced, is quite similar to Copenhagen Market in all plant characteristics. It is possibly slightly smoother and a lighter green color. The heads average smaller and can be planted closer, from twelve to fourteen inches apart in the row. It is early maturing, about the same as or a few days later than Jersey Wakefield.

Jersey Wakefield, Golden Acre, and Copenhagen Market are the three leading varieties of early cabbage. There are many other varieties that are early, having been selected and offered by seed companies in order to fit certain conditions of soil, climate, or market. It is within the power of every grower to test new varieties and different strains of the standard sorts, in order to find that one which comes nearly, if not entirely, up to his requirements.—W. T. Tapley.

Pruning Plum Trees

VERY little difference was noted in the behavior of heavily pruned plum trees and trees receiving much less pruning in tests conducted over a number of years with several standard varieties of plums on the grounds of the New York State Agricultural Experiment Station at Geneva. In the opinion of the Station horticulturists most varieties of plums require but little pruning subsequent to the proper shaping of the trees after they are planted.

Since little pruning gives just as good if not better trees, it is regarded as a waste of time and effort to pay too much attention to the pruning of plum trees. The chief recommendation is to thin out thick growths where necessary and to remove broken or injured branches.

Tell a man there are 267,543,201 stars and he will believe you, but if a sign says "Fresh Paint" he will make a personal investigation.

MORE POWERFUL TRACTORS
Save Plowing Time

Lowest Plowing Cost Ever Known!

Whether preparing the seed bed or harvesting the crop, your work is usually a race against time. Hardly a year passes that does not call upon you at some time for high pressure work to overcome unfavorable weather conditions or some other crop menace. *Results* are what you must have. And for *results* you must have a tractor that is big enough for your needs—an OilPull of the proper size.

At plowing time, for instance, the right size OilPull saves hours of time. Saves labor cost. Reduces power cost. It cuts the cost of plowing an acre of ground to the lowest figure the world has ever known. Neither man power, animal power nor mechanical power has ever been able to plow so cheaply. These are facts easily proved.

Take Fuel Cost, the biggest cash item of expense, for example. The OilPull plows at *lowest fuel cost* per acre. An OilPull has held all principal fuel economy records for the past 14 years. Triple Heat Control, Oil Cooling, Perfect Carburetion, Hairline governing, Ball Bearing Transmission and other features make this possible.

Take Labor Costs. One man operates a 3-plow OilPull as easily as a 2-plow outfit. But instead of merely plowing 50 per cent more, owners report that he actually *does double the work*—saves *half his time*—cuts 50 percent from his labor cost per acre—has half his time left for other work. This is due to increased power and speed. Larger OilPulls reduce labor cost still more.

Take Upkeep Expense. OilPulls are famous for low operating cost. They seldom need attention. Average expense per year among hundreds of OilPull Tractors is less than $20.

Take Depreciation. An OilPull will last, on the average, 10 years and more. Our late models are expected to increase even this great span of life. This means an extremely low depreciation each year.

It is such remarkable economies as these which cut the cost of plowing to the lowest figures ever known. *Be sure you choose a tractor that is big enough for your work.*

Light-Weight
OILPULL
A 10-Year Tractor

The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, husker-shredders, alfalfa and clover hullers, bean hullers, silo fillers, corn shellers, motor trucks and tractor winches
Serviced Through 33 Branches and Warehouses

Avoid Disappointment!

The new *Light-Weight* OilPull has met with unprecedented demand. Last year many farmers who delayed were disappointed. A shortage in some sizes is threatened this year. We suggest that you see your nearest Rumely dealer at once to avoid disappointment. Meanwhile, mail the coupon for vitally important facts about tractor economy. HORTICULTURE

DR. S. W. FLETCHER,
Staff Contributor and Adviser
Head of the Department of Horticulture
Pennsylvania State College

Annual Meeting of State Horticulturists

(Continued from last week)

S. W. FROST, of State College, located at the Arendtsville Field Laboratory, reported a more hopeful outlook for the ultimate control of the Oriental moth, altho at present no wholly satisfactory treatment is known. The natural parasites now are reducing the moths considerably, especially in New Jersey, where the pest has been established longer than in southeastern Pennsylvania.

Cultivation, especially by discing, continues to be of benefit: this should be discontinued for a period of three weeks after the early spring cultivation so as to prevent the larvae that have been turned under by cultivation from escaping. Four or five nicotine sprays reduce the infestation and are profitable under some conditions, especially when combined with the other preventive measures.

Experiments with bait pails were conducted at Arendtsville the past season. Gallon pails filled a quarter full with a mixture of one part molasses and eight parts water were hung on every other tree in every other row. The pailed block had twenty-five per cent less infested fruit than the remainder of the orchard. This method may have possibilities.

J. W. Stear, of the State Department of Agriculture, finds four broods in Cumberland County; the pest has not yet reached the western part of Franklin County. He has observed as high as ninety per cent of the insects parasitized in New Jersey.

Summing up the evidence accumulated thus far, E. R. Hodgkiss recommended the following spray schedule for peaches in addition to cultivation, cleaning up dropped fruit and other sanitary measures: Use a spray containing nicotine at the shuck fall, ten days later, and five weeks, seven weeks and nine weeks after shuck fall. Occasionally a later application may be needed. This program should give forty to sixty per cent control.

Attention Directed to Oil Sprays

The increasing virulence of the European red spider or mite, and of the rosy aphis, has directed attention to the value of oil sprays. These are of two types, the miscible oils and the oil emulsions; according to Professor Hodgkiss, the latter are perhaps somewhat preferable. The oil sprays are not cure-alls, but undoubtedly they are excellent for the delayed dormant treatment, especially where the European mite or rosy aphis is a problem.

An oil spray also is superior to the standard lime-sulphur spray for killing the San Jose scale, but since it lacks the fungicidal value of the lime-sulphur, the latter usually is to be preferred when the mite and aphis are not serious.

Professor Hodgkiss is of the opinion that the home made engine oil emulsion is not as generally useful as one of the commercial oil emulsions or miscible oils, because of the difficulty of securing a uniform product in home preparation.

Uncommon Peach Diseases

W. C. McCubbin, of the State Department of Agriculture, called attention to several rather uncommon peach diseases, one being "leaf roll" in which the leaves turn yellowish, roll upward, and drop early in the fall. This is not due to a parasite, but to the death of the small rootlets because of unfavorable soil conditions, possibly accumulations of iron and aluminum salts.

Another is "punky wood," in which the trunk, near the ground, is very soft and the tree unthrifty. No other control is known than stimulating such trees with a heavy application of nitrate of soda.

The lane is bordered with cold frames on Monmouth Truck Farm, owned by Ernest Hiltbrunner, Monmouth County, N. J.

The fruit trade papers recently have carried scare headlines about the condemnation of American apples in England, because of the spray residue on some of them, especially those from Virginia which are sprayed with Bordeaux late in the season, and those from the Pacific states, which have had eight to twelve sprayings with arsenate of lead.

The Question of Arsenic Poisoning

This matter was discussed at the Harrisburg meeting. Local health officers in England have analyzed these apples, and claim that they contain enough arsenic to cause poisoning. This does not seem at all probable, for numerous analyses made in this country have shown that a man would have to eat several bushels at one sitting to get even a stomach ache,—from the arsenic. Perhaps this is the English way of retaliating against our embargo on English potatoes.

The discussion of dusting and spraying, led by F. N. Fagan, had the usual indefinite conclusion. Dusting was commended by J. A. Runk, of Huntington, who has secured excellent results on peaches and promising results on apples. He stressed the point that dusted trees have better foliage than sprayed trees. Neff Richards, of Bedford County, secured eighty-five to ninety-five per cent of control of scab with both spray and dust. On the other hand, R. E. Atkinson, of Wrightstown, Bucks County, was not able to control scab with dust, but did control it with spray. He will not dust next year except as an emergency measure, when time is the limiting factor or the water supply inadequate. Several other speakers testified for and against the method.

It is unfortunate that this subject is so much a matter of biased controversy—that there are some who still see no good whatever in dusting, in spite of the fact that a constantly increasing number of growers are using this method.

It must not be forgotten that 100 per cent control of pests is the chief, but not the sole, objective. Almost equally important is expediency—how to get certain results at the least expense, and particularly, in these days, with the least labor. Many men are dusting, not because they feel it gives as good control as spraying, but because it is more expedient under their conditions of labor, water supply, etc.

Spraying vs. Dusting

A middle of the road, fair minded statement of the situation might be something like this: Spraying is the standard method of pest control in orchards. It is practically certain to give good results when properly executed. Dusting in general has not given as good control as spraying, especially of apple scab, altho in many cases results approximating those secured by spraying have been obtained.

There is reason to hope that as the technique of dusting is better understood, and the materials and machinery improved, the disparity between dusting and spraying may be still further reduced. At present, spraying is safer and surer, and is to be generally recommended.

Certain of the larger growers, however, may find it more expedient to dust than to spray because of difficult labor conditions, inadequate water supply, or hilly land; and a very considerable number may find it desirable to use the duster for certain applications, as a supplement to spraying, especially after midsummer when the most virulent scab period has passed.

Illustrating his point that the fruit grower should strive to secure fruit of large size, by pruning, fertilizing, and other cultural methods and possibly by thinning also, A. F. Mason, of New Brunswick, N. J., quoted Philadelphia market reports of January 10, 1925: Staymen, 2½-inch, $5@6 a barrel; 2¾-inch, $7 a barrel. York, 2½-inch, $3.50 a barrel; 3-inch, $5.75 a barrel. Greening, 2½-inch, $4.50 a barrel; 2¾-inch, $6.50 a barrel.

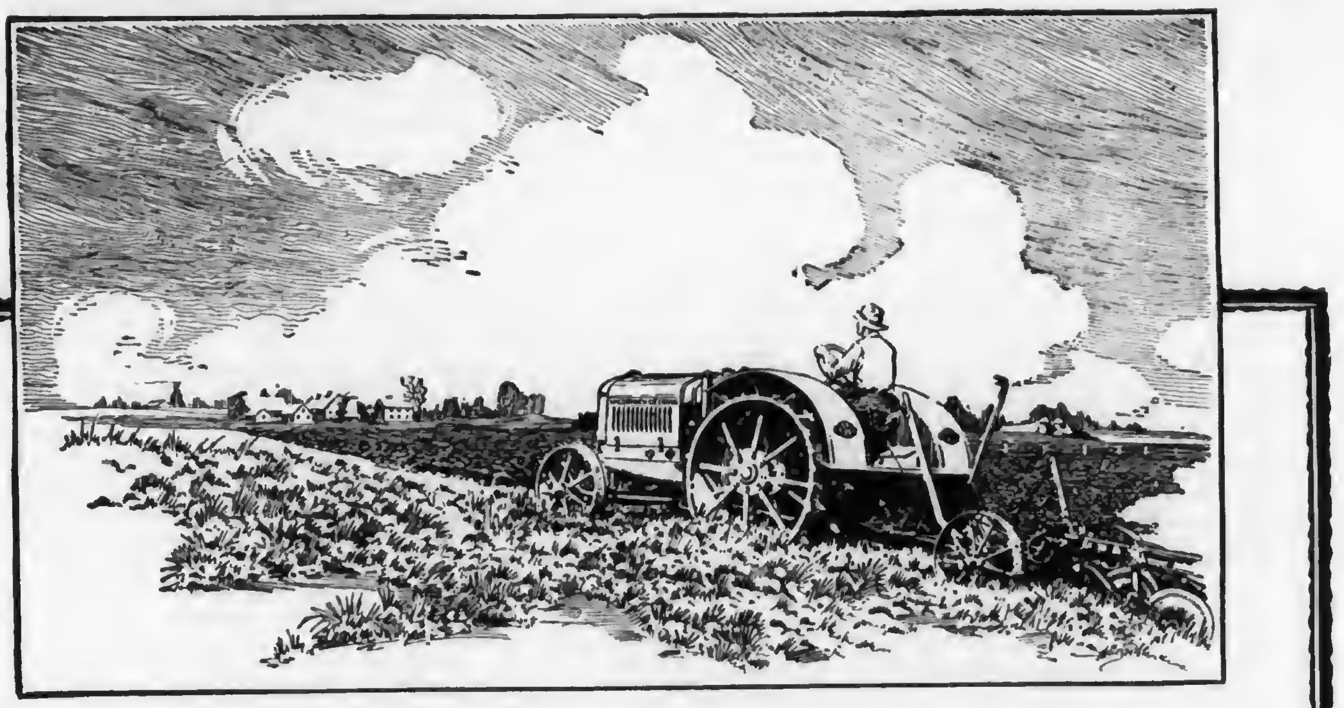
Strive for Good Color and Size

"It appears, therefore," said Mr. Mason, "that an additional quarter inch of size may add from $1.50 to $3.00 a barrel. That is worth working for." He showed the market value of color by the following Philadelphia quotations of January 11, 1926: 2½-inch New York McIntosh, poor color, $7@7.50; same, average, $8@8.50; same, high, $9.50@10. Good color, also, is worth $1.50 to $3 a barrel.

Good color is the result of many conditions, such as rate of growth, amount of sunlight, amount of moisture, time of picking. It may be influenced most of all by open pruning, and time of picking. Certain trees partially picked on October 15, leaving the greener fruit on the trees for a later picking, gave seventy per cent red apples at the first picking and ninety per cent red apples at the October 28 picking. It cost 3.5 cents a bushel to harvest the crop, when all the apples were picked at one time, and 4.8 cents a bushel to harvest in two pickings.

In 1924, twelve Winesap trees were thinned so that the fruits were six to eight inches apart. Twenty

(Continued on page 15)



A Recipe to Make Farming More Profitable

THE other day one of the great American leaders, a self-made man to whom other men listen with great respect, made two very simple statements that have an important bearing on farming.

First, he said: *"One great problem before us is the need of reducing costs. Success comes to the man who makes anything as good as anybody else, but also makes it cheaper!"*

Here he has hit on the farmer's biggest job. To-day the old methods, old-fashioned equipment, and slow muscle power that turned out a good day's work in 1913 are eating deep into farm economy. The profit is bound to be slim for the farmer who does not cut costs to the bone. He must adopt the faster, more productive methods that add to income, and so raise his family's standard of living.

The further advice of this man is: *"I don't believe in Ben Franklin's maxim about saving pennies. If you watch the big things the pennies will take care of themselves."*

This is a plea for the most practical kind of economy—a plea for *making* money rather than *saving* money. It comes from a man who began at the bottom of the ladder and built up a great business. If he had hung onto pennies, afraid to invest in money-making equipment, he never would have been heard of. In industry the old equipment is scrapped, no matter how costly, as soon as better, cost-reducing equipment comes on the market. In farming it *must* be the same.

A new year of farming is ahead. How profitable can you make it? The question hinges largely on equipment. The methods of 1860 would force a family into poverty to-day. The methods of 1913, too, fall far short of the changed needs of to-day.

You are living and farming in the mechanical power age. The McCormick-Deering builders have developed a long line of modern, big-scale machines to work with McCormick-Deering tractor power and to help the farmer in his battle with production costs.

This winter, check your old equipment against the work to come next spring and summer, talk things over with your family and resolve to make your farming more efficient, and make it easier, too. See the McCormick-Deering dealer; profitable farming begins at his store.

INTERNATIONAL HARVESTER COMPANY

POULTRY

R. G. KIRBY
Staff Contributor and Adviser
Kirby Poultry Farm

Building a Poultry House

I would like to know a few things concerning poultry. What would you advise raising for a green food for a flock of 300 hens? I have a fair-sized orchard, so something that could be raised as an intercrop would be satisfactory. I am feeding small heads of cabbage this winter but only have seventy-five hens, it would take considerable cabbage for a large flock. Which type of house would you advise? I have the foundations 60x20 feet. Several poultrymen have advised the shed type, but State College advises the uneven span. Would the latter need special ventilators on roof? Is it advisable or necessary to enclose the rafters and studs directly over and back of the roosts and then have a hinged opening in back to provide ventilation? Would you partition such a house into two or three pens?—E. B. W., Perry County, Pa.

Mangel beets and cabbages are standard succulent feed for hens. Sprouted oats are probably the best green feed. If you wish the orchard for a summer range for the hens and growing stock, it can be left in clover sod.

The advice of the state college advisers concerning poultry houses will be safe to follow. They have the opportunity of traveling around the state and making observations of poultry houses under all conditions.

Not Necessary but Makes It Warmer

It is not considered necessary to enclose the rafters over the roosts or back of them but such construction makes the house a little warmer. Hinged openings in the back of a house make better summer ventilation possible. They also increase draughts over the roosts in winter if they do not close properly. Such openings should be carefully made so they can be tightly closed at certain seasons.

We have a sixty-foot house which we divided into three sections, each twenty feet wide. I like this plan best as it makes the house less draughty. The sections seem warmer on a windy winter day than a house without partitions. When a house is inclined to be damp the condition can be improved with ventilators in the roof. Many poultrymen keep their houses in good condition without ventilators by properly building the front.—R. G. Kirby.

Doesn't Produce Results

In 1924 we had a poultry expert here who helped everyone who asked advice. He mixed a laying mash made up of protein, 24 per cent; fat, 5 per cent, and crude fiber, 8½ per cent. It was composed of wheat bran, wheat middlings, corn feed meal, oat flour, choice alfalfa meal, corn gluten feed, fish meal, meat meal salt, that made hens lay after using 100 pounds of it. When he left he had the mash mixed and sold by another company but uses his signature. I have been buying it this fall 100 pounds every week but the hens didn't respond. In January I bought a bushel of wheat and gave the hens bran mixed with hot dishwater morning and noon. They have doubled the amount of eggs. I give the corn at night about 4.30. Can you tell why my hens didn't do as well on it now as when the expert was selling the mash? The hens are in healthy condition, the pullets began laying in July. I was feeding bran shorts and wheat corn.—Mrs. H. O. H., Wicomico County, Md.

The elements contained in the laying mash formula should give good results. Possibly your pullets were not fully matured and were not ready to lay in December. The old hens in the flock were probably resting. In January the entire flock were ready to produce eggs. I do not think the production was due to the bran mash mixed with hot dishwater. It will probably pay to keep on feeding the balanced dry mash.

Sometimes pullets which have laid in July and August go into a fall moult and do not produce many eggs until after January first. This may have caused the low egg yield during December.—R. G. Kirby.

Steady Market for Fresh Eggs

SOON after January first there is an increase in the production of strictly fresh eggs and the price drops rapidly. Then a great many producers realize that buyers from the best stores are paying about fifteen cents or more per dozen for eggs than the farmer is receiving. Immediately they become discouraged and wish to find a better market for their eggs at once.

The business of successfully supplying eggs direct to the consumer cannot be established on a satisfactory basis at a moment's notice. I think this article is rather seasonable because we now have come to the early hatching season. The early hatched pullets produce fall and early winter eggs. And that is the time to work up the business of selling fresh eggs direct to the consumer.

Can't Be Done in a Hurry

Too many producers are satisfied to sell eggs to the dealers when eggs are scarce and prices high and then expect to work up a select trade when eggs are plentiful and prices are low. It is rather difficult to work up a premium egg business in the spring, but it is possible to keep the customers that purchased eggs from you in the period of scarcity and sell quality eggs to them thruout the year. The weakest link in the efforts of some producers to sell eggs direct is the fact that they make the start in the spring.

Must Cull Customers, Too

An egg producer has to cull his customers in a measure as he culls his flocks. Some customers will keep a few hens or have a nearby friend who supplies them with spring eggs. In the fall the regular source of supply falls down and they come to you for eggs when it is no trick to market them profitably. Such customers may not appear in the spring during the period of highest production.

Keep the fall eggs for the customers that will buy regularly thruout the year. Gradually build up the trade with that type of buyer and you can still sell eggs at a premium in the spring.

Fall is the time to gather in new customers when your pullets are laying and eggs are scarce on the general farms. Some of these new buyers can be developed into permanent customers. Those that fail to show up the following spring can be culled out the following fall when they want fresh eggs. Try and never be out of eggs when your regular customers call in the fall and early winter.

Here is a complaint I have often heard from producers who try direct marketing, "We had the buyers coming along fine until last fall when production slowed up and we had to turn them down for a few weeks. When production increased the customers failed to show up." I would rather hatch enough pullets early to supply this fall trade and hold the customers even if some of the pullets molt because of the early hatching date.

Not every farm is located properly for direct marketing. The best results come if the farm is located on a good road that is open all winter. It should be within a few miles of a good market city. Manufacturing towns use a lot of eggs. Most of the workers have garages where the hen houses used to be and they have incomes large enough to buy plenty of fresh eggs.

Increase Number of City Buyers

It is a great help to have an egg-buying friend in a certain office or factory where the business is prospering. One buyer will tell another where the fresh eggs come from. New customers will be found and often they will buy for each other and take large orders which cut down the time required to make the sales.

About five years ago a lady stopped at our farm and asked for fresh eggs. I told her they were all promised for that day. She said her mother was sick and could eat nothing, but they thought fresh eggs might tempt her. That being the case I sold her two dozen eggs out of sympathy and took a chance on getting enough within an hour late in the day to fill the promised order.

That lady has been responsible for seven new customers taken on as the egg production increased and their business has been worth several hundred dollars more than the eggs would have brought at wholesale prices. I could state several similar instances and at present the addition of private customers is only limited by the number of eggs for sale except during periods of heavy spring production.

You cannot develop a private trade much larger than you can supply from August until January 1st. Our buyers do not seem to consider the price or the season in eating eggs. They just want the eggs. It is lucky for most poultrymen that the cold storage plants are in business and buy during the spring. It insures some income from the spring poultry business. There is no trouble in marketing the product during the remainder of the year.

Place the Eggs in Neat Cartons

Placing the eggs in neat cartons with the farm name on the outside is necessary. Cartons can be packed in advance and this speeds up the sales and the customers have a safe manner of carrying the eggs home in their cars. Some buyers bring the boxes could continually bring back plan as the boxes only cost about one cent each and a clean fresh package adds to the appearance of the eggs. A plan of refunding for boxes would continually bring back dirty boxes unfit for use.

In eleven years of selling eggs direct to the consumers we have built up a trade which is profitable. I used to wonder if the time taken in making the sales did not amount to more than the profits. This thought occurred during seasons when eggs were very high in certain large city markets. But as we continue in the business I think more of this private trade and the books show that a large part of the very moderate prof-

(Continued on page 14)

Always a wise investment NOW Better than ever before

Dodge Brothers, Inc. have announced astonishingly low new prices.

They have announced important refinements in their product. Always building an exceptional car, they are now building better than ever.

Better in many ways—in beauty, comfort, driving vision, engine smoothness, snap, elasticity, and getaway.

The simultaneous offering of lower prices and vital improvements is made possible by a gigantic expansion of buildings and equipment.

Ten million dollars so invested permit great savings through vastly increased volume and efficiency.

Part of these savings goes into further betterment of the car. The other part goes directly back to the buyer—in the form of a price reduction that staggered the industry.

Those who chose Dodge Brothers Motor Car in the past invested their money wisely. Today they invest more wisely than ever before.

$15000.00 in cash Prizes for Feeders of Dairy Cows and Beef Cattle—

State fairs and livestock shows are feeding contests. The premium list is the book of rules. Contestants pay an entry fee or stall rent and buy their feed.

Most fairs and shows are commercial enterprises, yet they are supported by all agricultural colleges, livestock associations and farm papers because they help the farmer and feeder.

We believe in rewarding feeders for their skill in getting the utmost out of their feeding materials, therefore we have launched the greatest feeders' contest of all.

No Entry Fee—No Stall Rent

14 Prizes for Cow Testing Associations	$ 3,000.00
14 Prizes for Individual Dairy Herds	2,100.00
7 Prizes for Championship Cows	1,000.00
14 Prizes for Beef Cattle Feeders	2,500.00
12 Prizes for supervisors or verifiers	2,650.00
24 Prizes for herd managers	1,250.00
37 Prizes for co-operating feed dealers	2,500.00
122 Prizes, totaling	$15,000.00

Feed Less Grain Make More Money by Balancing the Ration with CORN GLUTEN FEED 23% Protein The Protein Product of Corn

Every feeder of six or more dairy cows, or forty or more beef cattle is urged to enter this contest. You can feed anything you like just so the grain ration contains 25% or more of Corn Gluten Feed.

Enter this contest and you will make more money. Experts in feeding will visit you and show you how. You will go through it richer—both in experience and money. Contest starts April 1—ends September 30, 1926.

The simple rules and conditions are given in our Bulletin No. 4. Write for this bulletin and say whether you wish to enter as Cow Testing Assoiation, Individual Dairyman, or Beef Feeder, so we can send you the right entry blanks.

Dairy Calf Clubs

DAIRY calf club work should show a renewed activity in Pennsylvania, according to E. B. Fitts, in charge of dairy extension work at the Pennsylvania State College, now that several counties are free from tuberculosis. In order that only acceptable heifers may be secured for club work the dairy extension representatives together with A. L. Baker, state leader of boys' and girls' club work have made the following suggestions, which, if followed in the organization of dairy calf clubs, should insure satisfactory results.

A Few Helpful Suggestions

1. Put the matter of heifer selection in the hands of a competent committee.
2. If possible, get calves from herds where farmers have been doing constructive breeding work for a number of years.
3. If calves must be taken from herds where little or no constructive breeding has been done, records and individuality of sire and dam should be given careful consideration in addition to the general type of the calf.
4. Calves should always be from a sire having productive line of inheritance, (i. e., from a family noted for production).
5. Select calves only from tuberculin tested herds.
6. Where records of dam are available, 400 pounds of butterfat should be the minimum.—A. L. B.

So Horns Won't Grow

WHEN the calf is about ten days old you can feel a button-like lump where each horn will later appear. This is the best time to prevent the growth of horns. With scissors clip the hair from the button-like lump.

Wrap the end of a stick of caustic potash or caustic soda in paper to protect your hands. Dip the end of a stick in water and hold it as you would a pencil. Rub the skin over the lump until it bleeds at the center. Rub vigorously, especially on the highest part of the lump and for a space around it about the size of a dime. Do not make it wet enough so the caustic potash will run.

Market for Eggs

(Continued from preceding page)

its have been due to the direct-to-the consumer trade.

It is somewhat of a responsibility selling eggs direct. The reputation for fresh eggs developed during eleven years of effort might easily be ruined. Just one basket of questionable eggs distributed among our customers would cause them to lose faith in our product.

I have noticed that buyers who have started in taking two dozen eggs every week often increase their regular orders to eight and ten dozen eggs every two weeks. They come every two weeks because they find out that strictly fresh new laid eggs are easily good for that length of time. And the larger the orders the greater the saving in time for the producer and members of his family who make the sales.

The sign board helps in picking up new customers and in posting prices, but the cream of the customers are the regular buyers who come without a sign because they have learned the pleasure of eating high quality eggs and require them at all seasons.—R. G. Kirby.

Mother (after visitor had gone)—Bobby; Bobby, what on earth made you stick your tongue out at our pastor? Oh, dear.

Bobby—Why, muvver, I just showed it to him. He said, "Little man, how do you feel?"—and I thought he was a doctor.—Life.

Horticulturists Meet

(Continued from page 11)

per cent of the crop on the thinned trees was less than two and one-quarter inches, and fifty-five per cent of the crop on the unthinned trees.

In 1925 the thinning was continued; the average sale value of the fruit from the thinned trees was $17.82, as compared with $14.01 for unthinned trees. The difference, $3.81 per tree, represents a gain of over $100 an acre, after deducting the cost of thinning, which was sixty-nine cents a tree. The old Winesap, however, is a variety that profits by thinning more than some other varieties, as the York.

Discussing this paper, Sheldon Funk, of Boyertown, stated that color and size are, to a certain extent, antagonistic characteristics,—a maximum of size usually means a minimum of color and of keeping qualities, and vice versa. The aim should be to strike a happy medium.

Position of Association Stated Again

Little was heard at the meeting about the deer problem, except brief remarks by D. M. Wertz, of Waynesboro, re-stating and emphasizing the position of the association—that the deer are the property of the state, hence the state should assume full responsibility of their depredation, either by preventing it, or by paying for the damage. The open season for doe in a few sections has helped somewhat, but in the state as a whole the damage is increasing rapidly.

Fencing is the only practicable solution in many isolated farms; but it is unjust that the land owner should be required to pay one-half the cost of fencing to protect his young orchard against the state's livestock.

The Board of Game Commissioners is now showing a movie film—"The White-tailed Deer in Pennsylvania"—to sportsmen's organizations around the state. In this film damage to farm crops by deer is featured. This is good educational work, but it may come too late.

Will the State Horticultural Association and the Agricultural Council of Pennsylvania allow this challenge to go by default?

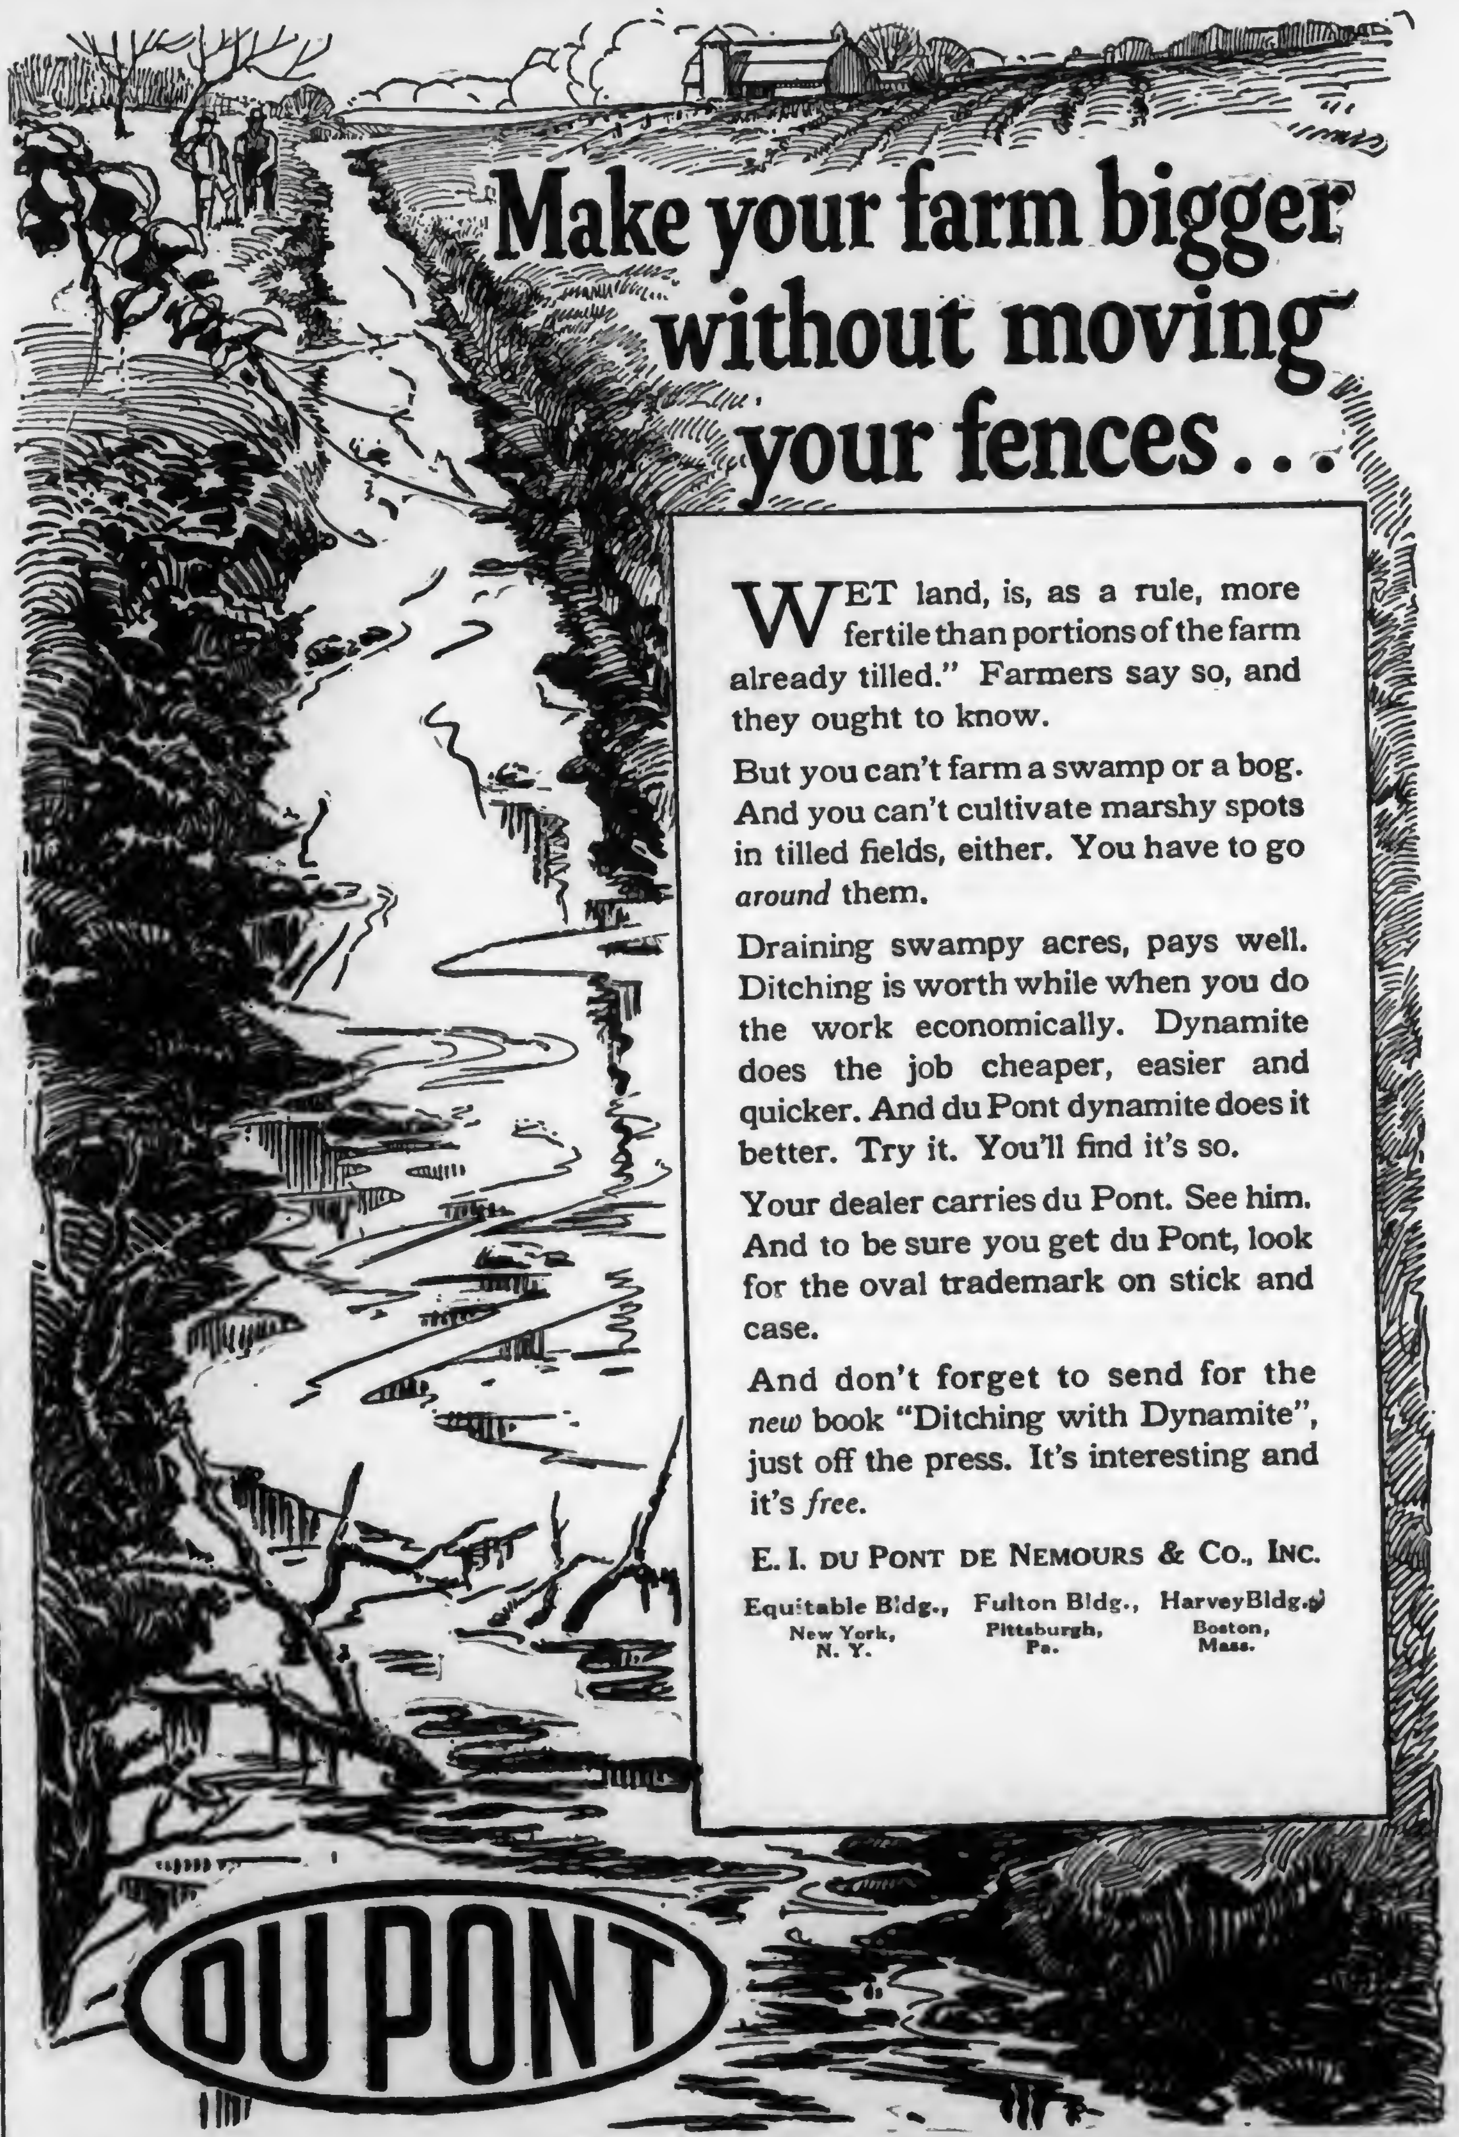
It is fair that the farmers should have representation on the Board of Game Commissioners, in view of the magnitude of this problem in Pennsylvania. The Horticultural Association endorsed Howard Anderson, of Stewartstown, York County, for this position. He is not only a prominent fruit grower, but also an ardent sportsman, and should be able to see both sides of the question.

The Tendency of Roadside Markets

According to W. T. Tapley, of State College, roadside markets started as a method of selling home-grown farm produce, and many of them still are of this nature, but the tendency more and more is to add other supplies, such as gasoline, candy, "hot dogs," soft drinks, and to include general farm products, such as milk, butter, and eggs, as well as fruit.

As he sees it, this tendency is justified, for time is valuable to all people. If at one stop all the produce required can be obtained, time has been saved and service rendered. This policy has resulted in many stands handling produce which has not been grown by the seller. Future development of the roadside market will probably be along the line of the organization of community co-operative roadside markets, selling the farm produce of an entire community.

This is the inevitable result of the present situation along certain highways, where individual stands are so close together that none does a satisfactory business.—S. W. Fletcher.



Make your farm bigger without moving your fences . . .

"WET land, is, as a rule, more fertile than portions of the farm already tilled." Farmers say so, and they ought to know.

But you can't farm a swamp or a bog. And you can't cultivate marshy spots in tilled fields, either. You have to go *around* them.

Draining swampy acres, pays well. Ditching is worth while when you do the work economically. Dynamite does the job cheaper, easier and quicker. And du Pont dynamite does it better. Try it. You'll find it's so.

Your dealer carries du Pont. See him. And to be sure you get du Pont, look for the oval trademark on stick and case.

And don't forget to send for the *new* book "Ditching with Dynamite", just off the press. It's interesting and it's *free*.

Feed Linseed Meal and
IMITATE SUMMER CONDITIONS

The tonic effect, as well as the high protein content of summer pasturage, can in great measure be duplicated by the liberal use of Linseed Meal.

Prof. Morrison, author with W. A. Henry, of the world famous book, "Feeds and Feeding," says: "The effect on livestock of a judicious use of Linseed Meal is soon apparent in a thrifty appearance, a pliable skin, a sleek, oily coat and good 'handling' quality of the flesh. Due to its tonic effect it is especially useful as a conditioner for animals which are run down or out of condition."

A. F. Pierce, Prop. Sheomet Farm Jerseys, Winchester, N. H. says: "Linseed Meal is a wonderful conditioner as well as one of the best concentrates for increasing milk flow."

Frank Shields, Mgr. Kilohana Farms, Lewistown, Ill., writes: "After cattle have been on full feed for some time, Linseed Meal improves their digestion, gives their hair a more glossy appearance and makes them sell better when sent to market."

ALL FARM ANIMALS ARE WONDERFULLY BENEFITED BY THE LIBERAL USE OF LINSEED MEAL AND THE PROFIT BY ITS USE OFTEN RUNS AS HIGH AS 100 PER CENT. The books described in the Coupon below will tell you how. **Send in the Coupon now.**

DAIRY

A. A. BORLAND,
Staff Contributor and Adviser
Head of the Department of Dairy Husbandry
Pennsylvania State College

Bran vs. Middlings

How much salt should be mixed in a dairy ration per 100 pounds of grain feed? Last year I had all Holstein cows. The creamery gave me a test of 3.2 for the whole summer. Last fall I sold some Holsteins and bought three Guernsey and one red cow, and one Jersey and Holstein mixed. I am milking ten in all, five Holsteins and five others. When I made this change, I told the creamery man that I sold Holsteins and replaced them by better testing breed, so I expect a higher butter fat test for the future. After I told him that, he gave me a 3.4 test for one month. Then he went down again to 3.3. I sold heavy milkers on account of low test and now Guernseys are running on same test.—J. O., Montgomery County, Pa.

One pound of salt to the hundred pounds of grain is a fair allowance to be mixed with the dairy ration.

Cows vary considerably in the fat which is in their milk. Anything like fright, changes in the feed, and change in the weather, may affect the milk flow and the fat test of the milk. Furthermore, some Guernseys are low testers. However, it appears that there is sufficient evidence to indicate that you are getting an incorrect test. We suggest that you write to the Pennsylvania Department of Agriculture at Harrisburg, giving full information about your experiences with this creamery. The Department will investigate the situation and find out whether accurate testing is being done in the plant to which you are selling your milk.—A. A. B.

Treatment for Lice

Could you recommend some remedy for lice on cattle. Does treatment for lice tend to decrease the milk flow?—C. W. B., Warren County, Pa.

The eradication of lice from dairy cattle does not tend to decrease the milk. In fact, it should tend to increase the milk. Cattle infested with lice soon lose flesh and become unthrifty. A number of remedies have been proposed for the destruction of lice. A good bulletin on the subject may be had by writing to the United States Department of Agriculture, Division of Publications and requesting a copy of Farmers' Bulletin 909.

According to this bulletin, there are three commonly used methods of applying treatment for lice: First, hand applications; second, spraying; third, dipping. The best method to adopt naturally depends upon the season of the year, the remedies selected, the number of cattle to be treated, and the facilities available.

The insecticidal value of many of the dusting powders is dependent upon their naphthalene and pyrethrum content, and they are of value in helping to hold in check the parasites during the season when the weather is too cold for dipping or spraying. They are sold under various trade names.

The group of greases and liquids consists mostly of home made remedies, which are fairly effective and practicable in cases where a farmer has only a few animals to treat and gives the matter his personal attention.

The following remedies have proved effective when applied by hand and the treatment repeated, if necessary, in about sixteen days: (1) Cottonseed oil and kerosene, equal parts; (2) kerosene and lard mixed in the proportion of half pint kerosene to 1 pound of lard; (3) crude petroleum; (4) any of the dips recommended for use in dipping.

When to Use Remedies

The first three remedies are suitable for use during mild weather, but if animals are to be treated during very warm or very cold weather, it is advisable to use some of the dips instead of the oils, as the latter are liable to cause injury if the freshly treated cattle are moved rapidly, exposed to bright sunshine, or become chilled.

These remedies may be applied with a brush or a cloth. They should be distributed in a thin even coating over the surface of the head and body, including the inner surface of the ears, care being taken to see that there is no excess quantity at any point.

On farms where the number of animals is not large enough to justify the owner in providing a dipping vat, a spray pump may be used to advantage. Where an orchard spraying outfit is available it may be utilized for spraying animals. A small spray pump, which, equipped with hose and nozzles, can be purchased for less than $10, is convenient for the purpose.

Any of the dips recommended for lice may be applied in the form of a spray, and while spraying is usually not as effective as dipping, nevertheless, if the work is done well and carefully the lice can be eradicated by spraying. Two treatments should be given 15 to 16 days apart.
—A. A. Borland.

Mr. Phillip Simon and Mr. J. B. Reiff, Chester County, Pa., have used this concrete block silo for eighteen years. It has a capacity of eighty tons

Ready-Mixed Rations

I expect to start in the dairy business and am not experienced in that line of work. Will you give me some information for feeding dairy cows? What ready mixed dairy ration would you advise me to use to produce the greatest amount of milk? Do you advise me to feed a low grade of molasses?—W. J. Northumberland County, Pa.

The value of a proprietary mixture for dairy feeding depends largely on its food analysis, providing of course, that it is made of clean, wholesome materials. The good proprietary mixtures, according to my opinion, analyze a minimum of 24 per cent protein and 4.5 per cent fat, and a maximum of not over 10 per cent fibre. Any proprietary feed meeting this analysis is likely to prove satisfactory for milk production, because it is made from wholesome materials.

Fair proprietary mixtures analyze from 20 per cent to 23 per cent protein and at least 4 per cent of fat, and not over 12 per cent of fibre. Poor mixtures analyze from 16 per cent to 19 per cent protein, at least 3.5 per cent of fat, and not over 14 per cent of fibre.

Poor Protein Mixtures

Very poor protein mixtures, when used as the entire grain ration, analyze about 10 per cent protein and 3.25 per cent fat. It is true, however, that this last mentioned class of feeds may have a legitimate place in dairy cattle feeding. Since they have about the same analysis as corn meal and oats they may be used as substitutes for these feeds if their market price warrants the substitution.

Porprietary mixtures containing about 16 per cent protein may be used as a substitute for standard wheat middlings and wheat bran in the grain mixture, since bran and middlings also contain about this per cent of protein. The advisability of substitution depends largely on the comparative prices of 16 per cent protein mixtures with bran and middlings.

Cane molasses has given satisfactory results when fed to dairy cows at the rate of two or three pounds daily diluted with two or three times its weight of water and sprinkled over the roughage. This practice will make poor roughage more palatable and the cows thus consume more roughage than they would otherwise. Molasses is also an appetizer and may be used to advantage to feed cattle that are out of condition.
—A. A. Borland.

Lancaster Tobacco

BUYING of 1925 crop of Pennsylvania tobacco, after continuing for several weeks, has slowed down considerably with only about thirty-five per cent of the crop out of the hands of the growers.

The prices paid to date will average about ten cents per pound. Buyers were offering twelve cents for the best crops, but quite a few crops were sold for seven and eight cents per pound. These prices are about thirty per cent lower than last year, in the face of much higher production costs than obtained on the 1924 crop.

Indications at the present time point to only about sixty per cent of the crop being sold—probably not that much. Recent reports to the effect that a large Philadelphia cigar manufacturer intends to make about six million five-cent cigars, using a large proportion of Pennsylvania fillers, have not been verified. Certainly there has been no visible effect upon the tobacco market.

Heavy snowfalls within the past week will probably still further slow up the buying and delivery of the crop, as many sections of the county are impassable.—Lancaster, Pa., Feb. 11.

A New World's Record

Hillstead Farm
—the property of Mrs. John Wallace Riddle, Farmington, Connecticut, in October, 1925, achieved a new world's record for Guernseys with Anesthesia Faith of Hillstead. Age 4½ years. Record 19,741.4 pounds of milk, 1,112.5 pounds of fat.

Sugared Schumacher Feed

With protein added lowers milk costs. Sugared Schumacher Feed helped make this greatest record for Guernseys.

100 LBS. SUGARED SCHUMACHER FS FEED The Quaker Oats Company CHICAGO, U. S. A.

Hillstead Farm, Farmington, Conn.

The Quaker Oats Company, Chicago, Ill.

Gentlemen: We are pleased to tell you that Sugared Schumacher Feed was used continuously as part of the grain ration fed Anesthesia Faith of Hillstead 114,354 during her recent World's Record 365 day test as well as during her two previous tests.

We have been mixing Sugared Schumacher Feed in our herd ration and young stock feed for several years, and consider it a good economical feed for growth, condition, and production. Yours truly,

(Signed) David Munson, Farm Mgr.

Sugared Schumacher Feed will help your cows make larger records and larger profits. Under present market conditions Sugared Schumacher Feed combined with Boss Dairy Ration, or other choice high protein feeds, supplies the choicest rations for the milking herd at very attractive prices.

Dairymen everywhere realizing the present market situation are basing the rations for all their live stock on Sugared Schumacher Feed and are making more milk and making it more profitably. [2]

Consider This 18 Year Record!

The Hinman was the first practical All-American Milker.

Today it has an 18 year record of success. It has milked some of the most valuable prize cows making milk and butter records. It has served dairymen for 10, 12, 15, 18 years continously.

What better proof can you get of the value of Hinman to you!

Why this outstanding record?

Because—the Hinman works on the right principle. It's extremely simple. See picture above—there's everything but power and transmission. It's easy to clean and produces clean milk—certified milk in many dairies. It takes little power.

On its unequaled record—proved by practical experience in thousands of dairies, large and small—you can safely make up your mind that it's the Hinman Milker you want.

Write for interesting literature that gives the whole Hinman story. This is something no dairyman should miss. Write now for yours.

Agents. A few good opportunities open. Write at once.

Profits In Pooling Feed Orders

FOR the past two years we have watched with interest the plans which have been followed in pooling orders for large quantities of feed,—orders running into a great many thousands of tons,—and it seems to us an opportune time to ask those who are interested in feeding, to look over the record and see who has made the profit.

If farmers in a certain section had advance notice that potatoes were to be bought from them in large quantities, wouldn't it be very natural ror them to advance the price and hold for as much money as they could get? That is only natural. It is the way the law of supply and demand works and is exactly what has happened as the result of pooling large orders for feed. It has put the price of feed up, and instead of buying for less money, farmers have actually paid more,—how much more no one can tell definitely, but certainly several dollars per ton.

If, instead of large pooled orders in early summer, when the production of these by-products which go into the make-ups of feeds is usually small, farmers would purchase only as their needs require, shippers would be forced to look for a market for their output and lower the prices to induce users to buy.

With these facts in mind, would it not be better for users of feed to unite in a movement to buy feed only as needed and help to put the price down to their advantage, rather than continue the practice of pooling large orders that put the price up to their disadvantage?

It may seem strange to some for a feed manufacturer to be urging users to unite in efforts to put the price of feed down, but it is the policy of our Company to promote the interests of feeders in every way we can, whether in the manufacture of feeds we produce, or in advocating a policy which we believe is for the feeders' best interests.

Whether orders for feed are pooled or are not, our interests are not directly affected. It is in keeping with our policy as stated, that we are asking the attention of feeders before they pool further orders, to the undoubted result of pooling as practiced in the last two years, and as to who is getting the profits from the higher prices brought about by the pooling plan.

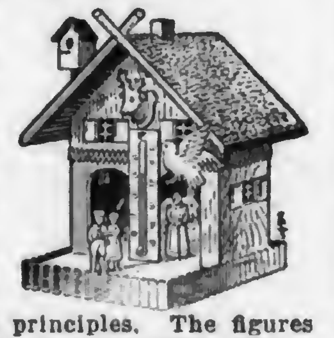
TI-O-GA FEED SERVICE

Swiss Weather Prophet



The Swiss Weather Prophet is made of hardwood. The house is decorated in front with a stag's head, a bird, glass windows and a thermometer between the doors. On the green covered roof is a starling's cage. The inner background is decorated with views of Switzerland. There are two doorways. When the carved figures of the two children come out, look for fair weather; when the little old witch comes out, rain or snow with stormy weather is sure to come.

This instrument is made on scientific principles. The figures which prophesy the weather are suspended on a platform, with a piece of catgut. This catgut is sensitive to the least change of atmosphere and is so adjusted that the figure of the witch comes out in advance of rain and the figures of Hansel and Gretel for fine weather. This Weather House will be sent prepaid for two yearly subscriptions at $1.00 each or with your own renewal and 50 cents extra. Reward No. 126.

N. Y. State Grange Meeting

Taber Urges Need for Stronger Farm Organizations

THE fifty-third annual meeting of New York State Grange was held in Watertown with State Master S. L. Strivings presiding. Mr. Strivings in his annual address urged farmers to buy in bulk at low prices. "Milk from Wisconsin and even Minnesota in thermos cans threatens the milk market of the East," he said. "To meet these invasions the farmers must take advantage of bulk buying to save the margins to offset this keen competition until more stable days are at hand.

"If the farmer wants the assistance of the government," he continued, "we are assured by our President that all will be done to assist cooperative endeavors. Will the farmer help himself? It seems reasonably certain that no one else will do it.

Effect of Weather Last Year

"The year 1925 promised most favorably, and crops came well over the state. About harvest time we came to most unfavorable conditions, and a storm period with thirty-five days of rain, followed by freezing and snow. This turned a promising harvest to complete loss in the western part of the state.

"Taken as a whole the year showed slight gains. Production has kept nearer consumption needs, and better prices have brought cheer and hope. The danger lies in the tendency to swing too heavily to excessive acreages next year in crops which now are at high levels. The chances are that we will over-crop on potatoes, beans and milk in 1926."

There were 1000 persons in attendance at the State Grange meeting, with 758 delegates registered. The secretary's report showed there are 897 Granges in the state with a total membership of 131,930. This is a gain of 43,000 members, and 174 Granges since 1910.

"Distribution is the chief farm problem," said H. B. Johnson at the first public session. "There is something wrong when the farmer receives ten billions of dollars for products which cost the consumers thirty billions a year. The cooperative association is the one weapon in the hands of the farmer to correct the present conditions. It can do more than legislature in the way of price fixing."

The Policy of the Future

In discussing "Our Future Agricultural Policy," National Grange Master L. J. Taber, in one of the final sessions, emphasized the acute needs of American farmers as more and better organization and good-will and cooperation between organizations. He said:

"You hear much these days of the beneficial effects of the agricultural surplus upon the farmers' prosperity. The supposed surplus of food products is after all a blessing to the consumer as it guarantees a meal ticket for tomorrow. But it frequently does financially depress the farmer and sometimes brings bankruptcy and failure.

"The surplus, however, that is more dangerous to the American farmer is not the surplus of corn, or of wheat, or of cotton, or of silk, but the surplus of second class politicians who want to use the farmer's misfortune to get them safely landed in office. . . .

"The American farmer needs a million more members in his organizations more than he needs a thousand pages of legislative statute.

"Any organization that allows pride or interest in its own program to stand in the way of the best interests of rural life is untrue to the farmer," Mr. Taber asserted. He believes that the burning question of the hour is "Strengthen the farm organizations. Develop good will between the organizations." He thinks that farmers must find a common ground upon which to build a sound agricultural policy, and that education, organization and cooperation are the materials with which to work.

"Antiquated marketing methods, uncorrelated productive machinery, crushing tax burdens, handicap agriculture as it meets the highly centralized and highly organized business activities of the nation," he said.

"We have had too much pessimism, too much whining, too much begging for a square deal. If agriculture is not getting its just reward it is agriculture's fault. Don't whine. Don't cry. Don't beg. Stand up and watch and fight. Don't ask someone to fight your battles. Don't try to get on the back of the government, but make organization, education and cooperation a wall defense of the welfare of agriculture and the nation."

Most of the officers of the State Grange were re-elected for a two-year term, including State Master S. L. Strivings. The session received into membership 1087 candidates, the most ever initiated into the sixth degree at one time in any state. National Master Taber assisted in the ceremony.

Some of the Resolutions Passed

Some of the resolutions passed are as follows: Favoring a tax of two cents a gallon on gasoline, with no exemptions, the money to go to the counties for the repair and construction of highways; opposing the St. Lawrence ship canal; favoring a bigger barge canal thru the center of the state; opposing tax legislation for snow removal from state and county highways; favoring the 18th Amendment and a state act to enforce it to take the place of the repealed Mullen-Gage law; favoring compulsory automobile liability insurance of not less than $1000; opposing the proposal to abolish the law requiring first voters to prove their ability to read and write; favoring law enforcement to the extent of deporting aliens who violate our laws, and jailing instead of fining American violators; opposing the advertising of oleomargarine or other butter substitute on the state fair grounds; opposing any change in the present rural free delivery mail system.

Action was reversed on last year's resolution to increase the dues of subordinate Grange members twelve cents a year to provide for the sending of the National Grange Monthly to members.—M. G. F.

Keep Ahead of Furnace

KEEP ahead of your furnace. It is a waste of fuel if the furnace is allowed to burn itself low before any fuel is added. The furnace should be checked before it gets too warm. This is especially true with hand regulated hot air furnaces. The top of the bed of coals should come up even with the fuel door. The capacity of the heating plant should always be sufficient so that it need not be crowded. When fresh fuel is added to the fire, live coals or flame should be left exposed at the back of the fire box if possible. This burns the gases which would otherwise pass off unburned when new fuel is added.

In hot water and steam heating systems it is very important to keep the flues clean. If dust and soot accumulate on flues around the boiler it acts as an insulator and prevents the fire from heating the water.—Ralph L. Patty.

"QUALITY MILK"

Winning Letter in the Pittsburgh District Dairy Council Contest

THE Pittsburgh District Dairy Council recently conducted a letter writing contest, awarding two $150 scholarships for the best letters from a farm boy or girl to a "city cousin" on the subject of "Quality Milk." The contest was open to children living in western Pennsylvania, eastern Ohio and West Virginia. The scholarships were won by twelve-year-old Raymond Slutz and fifteen-year-old Bernadette Gowday, both of Ohio.

The winning letter written by Raymond Slutz follows:

Dear City Cousin:—You sure would be surprised if you could see how Dad has changed things around here. But as you can't come I'll do the best I can to tell about what you wanted to know.

When Dad Learned About Bacteria

You see we used to think that if milk looked clean it was all right. Then when Dad found out about bacteria and how milk that seemed to be O. K. wasn't fit for use he just made things hum around here for a few days. He said his milk should be as clean as the best or he'd know the reason why.

First we cleaned the barn from top to bottom. Every cobweb was swept down and all the old rubbish taken out and burned. That was a dandy bonfire I'm telling you. Then we put in concrete floors and whitewashed all the walls and stanchions. We put in a couple more windows so the cows could have more light. Then we were ready to begin on the cows. All their udders and flanks were trimmed and every cow was made as clean as possible. Dad said it would be my job to see that they were kept that way. I have to see that they have clean bedding and all loose dirt brushed off before each milking. If there happens to be any dirt that won't brush off, I have to wash it off. It doesn't take long if I get right after it and the cows sure do look dandy.

Next, Clean Clothes and Clean Hands

Next Dad sees that his hands and clothes are clean. He had always milked with dry hands so he was all right there. Then he takes the milk out of the stable as soon as it is milked and cools it to about fifty degrees. After that it is put on the stand in a nice shady place, covered of course, so no dust or dirt can get in the can and then the hauler takes it to the station.

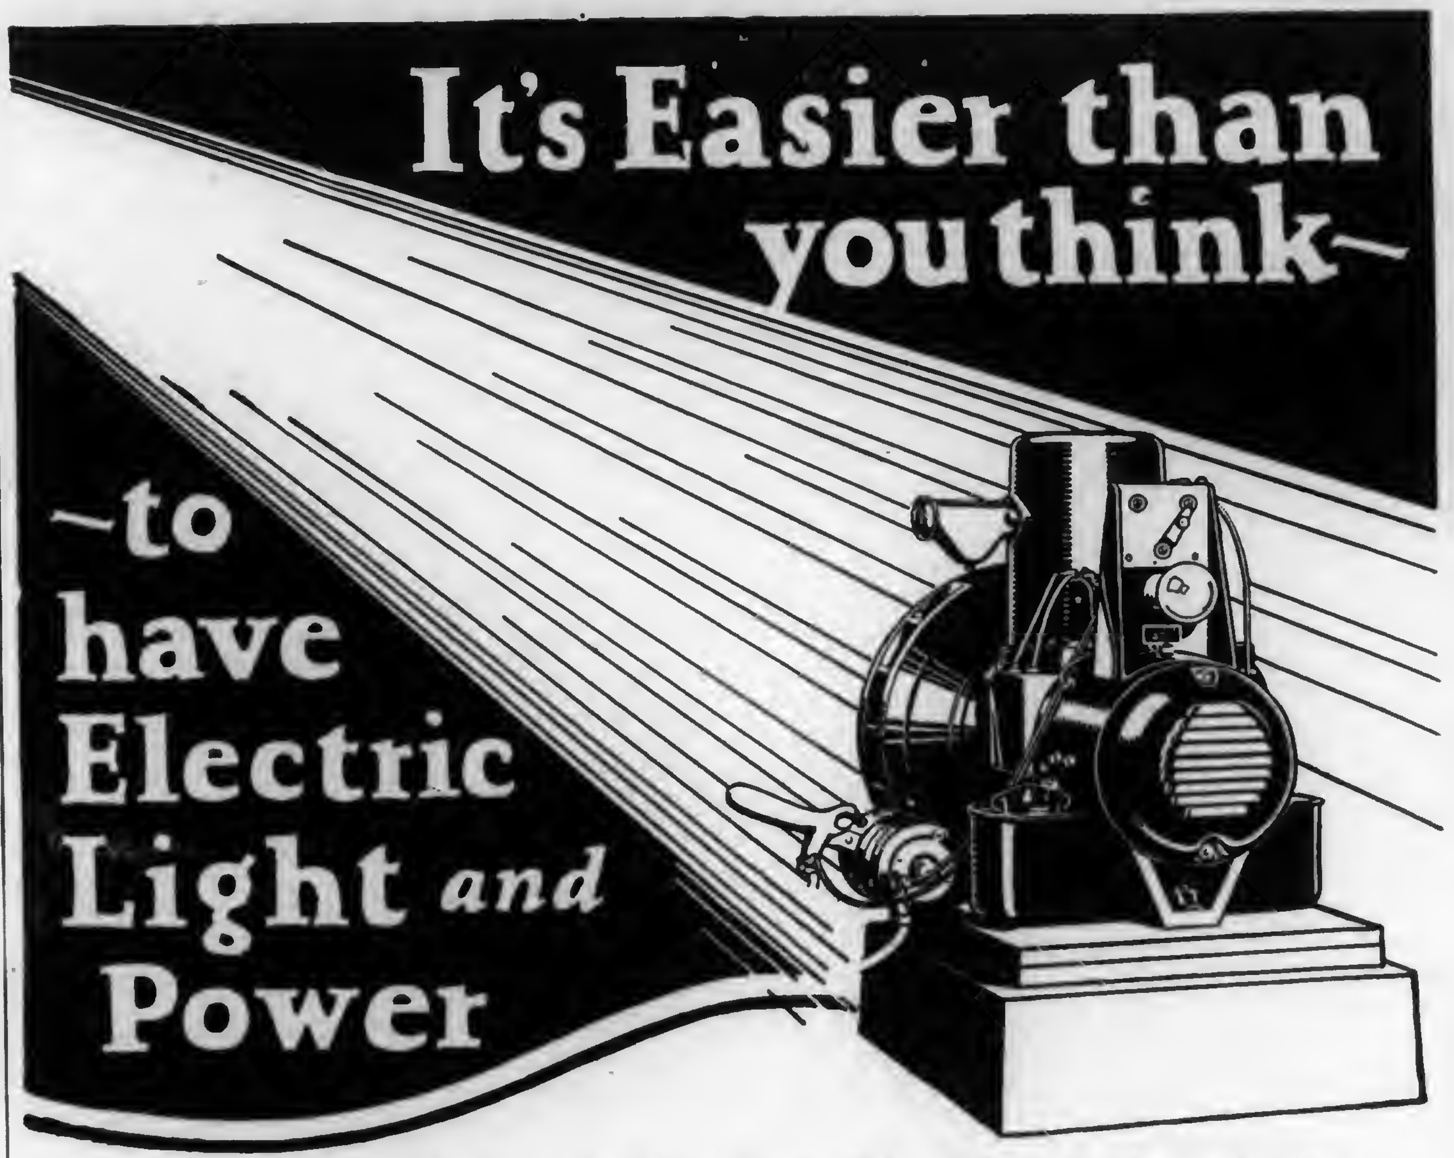
I've told you about Dad's and my jobs and almost forgot to tell what Mother and the girls have to do with keeping our bacteria count low. The pails, cans, strainers and milk house are theirs to look after. Clean milk put in a dirty pail or kept in a dirty place won't stay clean. So they keep all the milking utensils bright and shiny. They also keep our milk room nice and clean.

And It Didn't Cost Much

Our milk now grades with the best and you can see that it hasn't cost Dad much to put our milk in first-class shape. A little cement, lime and a couple of windows was about all he had to buy. The other things we did ourselves and what we have done others can do.

My letter is rather long, but we are all so interested in this clean milk proposition that I can hardly quit writing. Come out next summer, then you can see for yourself.

Your Country Cousin,
RAYMOND SLUTZ.



It's Easier than you think—
—to have Electric Light and Power

$195

f. o. b., Dayton, Ohio, is the price of the Delco-Light Plant illustrated above. A few dollars more cover freight, installation, wiring and fixtures. The total cost can be paid on easy terms.

YOU know what Delco-Light would do for your home. You know what a wonderful thing it would be to have plenty of bright, clean, safe electric light—as well as ample electric power for pumping, churning, washing, and other chores.

But do you know how easy it is for you to have all these things? Do you know that for a small down payment you can have this Delco-Light installed in your home—with five beautiful spun brass light fixtures—with all wiring done—and that the total cost, payable in easy installments, is only $248? (A little more west of the Mississippi.)

Think of it—Delco-Light, in *your* home, ready to switch on the lights for less than $250—and that payable on easy terms!

Don't wait. Write to the nearest Delco-Light Representative or direct to us for the details of this wonderful offer.

Old Colonial Family Homesteads

No. 36—Indian Neck Farm

ABOUT twenty-five miles from Philadelphia, in the lower end of the township of Buckingham, in middle Bucks County, lies the ninety-acre farm owned and occupied by William H. Worthington and family. It is beautifully situated with the historical Neshaminy Creek bounding it on the east and west sides. This at first thought sounds impossible, but the Neshaminy is a wayward and erratic stream, and at this point doubles on itself, flowing almost due south for nearly a mile, then, after making a long bend, thru a section beautifully romantic and attractive, known as Dark Hollow, it takes a northeastern course, forming a sort of peninsular shaped neck of land which has given to this farm the name by which it is known, "Indian Neck Farm." From here the Neshaminy takes a broad sweep and flows in a southeasterly course to join the Delaware below Bristol.

The old stone house, built more than 160 years, is now occupied by the sixth generation.

One has only to see this ideally romantic spot, to understand the attraction which it must have exerted over the neighboring tribes of red men, especially the great and powerful Lenni Lenape, who were at home here. That it was a favorite haunt of theirs, famous as a great hunting ground and the site of large and important native villages, is conclusively proved by the great number of implements of the hunt and of the home life, which have been, and still are, found here. Stone darts innumerable, arrow heads, knives, axes, spears, hammers, spades, etc.

Large and Fine Trophy Collection

Mr. T. Morrison Slack, whose farm also occupies a part of this Dark Hollow section, has been untiring in his efforts to gather these trophies together, and has what is probably the largest and finest private collection in Bucks County.

It is also noted as a favorite rendezvous of that family of Revolutionary outlaws, the Tory Doans, whose depredations were a source of terror to the settlers of those days.

The Indian Neck Farm was settled in 1767 by Joseph Worthington, a son of John, the weaver, one of the three brothers, John, Samuel and Thomas, who came from Lancashire, England, and settled in Byberry in 1705. They were devoted members of the Society of Friends, and were young friends of the four Walton brothers, who came from Byberry, England, in 1675, and who are supposed to have been the first settlers on the Delaware, between the Poquessing and Neshaminy Creeks. Six years before Penn settled in Pennsylvania, they arrived at New Castle and started up the Delaware, carrying their entire stock of provisions, utensils, etc.

A Cave Was the First Home

They were so impressed with the beauty and apparent richness of the land, they decided to locate there, and called the place after their native English home. They dug a cave in which they lived for several months while they prepared their ground for crops, their only implements being the hoes they had carried with them. Not having any wheat with which to sow their land, two of the brothers walked to New Castle for seed, and, each shouldering a half bushel, they walked back home, a distance of fifty miles.

Of the three Worthington brothers, Thomas married and remained in Byberry; Samuel removed, after marrying, to Maryland, where he has left many descendants, some of whom have held prominent positions in the political affairs of our country. The other brother, John, the ancestor of the Dark Hollow branch, married Mary, daughter of Thomas Walmsley, a wealthy farmer of Byberry, and settled in northern Byberry, where he lived until his death, at the age of eighty years.

He had eleven children. Joseph, the eighth child, was born in 1737, and was married three times, first to Esther Carver in 1767; and it was then he moved to the farm along the Neshaminy, but no records have been kept to tell whether he built the house or how old it might have been at that time. After Esther's death

(Continued on following page)

A corner of the Neshaminy meadow. The springhouse shelters one of the finest springs in the country.

Trucks Supply Capital

ACCORDING to the Pennsylvania Bureau of Markets 2443 cars of fruits and vegetables were unloaded at Harrisburg, Pa., during 1925, as compared with 2568 the preceding year, representing a decrease of 5 per cent.

Potatoes showed the largest decrease of any crop, only 210 cars being reported as compared with 329 the preceding year. Owing to the abundant local crop and the lower production elsewhere, only 37 cars were unloaded after August 1 as compared with 104 in 1924. While late potato receipts were reduced from all of the important sources of supply, the percentage of shipments from Pennsylvania loading districts increased from 51 per cent to 67 per cent of the total receipts of late potatoes.

Apple Receipts Drop

The carload receipts of apples showed a very decided drop, numbering only 16 cars as compared with 66 a year ago. This was chiefly because of the abundant supply of local fruit grown within trucking distance of the city. Pennsylvania receipts dropped from 20 to 5 cars and those from Washington from 19 to 6 cars during the year.

As in previous years, approximately 40 per cent of all the receipts consisted of mixed carloads of various fruits and vegetables almost entirely from Philadelphia and Baltimore; these amounted to 963 cars.

Increased quantities of practically all of the other fruits were found, bananas leading with 314 cars, 70 more than last season. Unloads of oranges amounted to 192 cars, watermelons, 144; cantaloupes, 127; grapes, 109; peaches, 77; grapefruit, 37, and strawberries, 25 cars.

Demand for Winter Vegetables

The increasing demand for winter vegetables is indicated by the large quantity of lettuce and celery received mostly from California and Florida. Forty-five cars of lettuce and 35 cars of celery received, were unloaded as compared with 29 and 14, respectively, a year ago. Of the 97 cars of cabbage received, 57 came from New York, 13 from South Carolina, and only 2 from Pennsylvania.

Produce for Pittsburgh

PITTSBURGH consumers used more than twice as many Pennsylvania potatoes during 1925 as during either of the two previous years, according to records furnished to the Pittsburgh office of the Federal and State Departments of Agriculture, by the railroads handling this business. Pennsylvania supplied 707 cars of potatoes, being exceeded only by New York with 729 cars. Receipts from these states and Maine totaled 48 per cent of the 3897 cars received as compared with only 14 per cent from Michigan, Wisconsin and Minnesota combined. This condition represents a radical change in the sources of supply for this market, as these western states furnished 37 per cent of the total in 1924 and 52 per cent in 1923.

The total receipts of 17 different fruits and vegetables amounted to 20,930 cars, or 3 per cent less than last year.

Large Increase in Grapes

The largest increase in any one commodity was in grapes, which totaled 2979 cars as compared with 2569 cars the previous year. A 50 per cent increase from California more than offset reductions from Pennsylvania, New York and Michigan, owing to the small crop in the eastern states. Another western product, cantaloupes, showed the next largest increase with California, Colorado and Arizona as the chief sources of supply.

Heavy reductions in the receipts of oranges from both California and Florida resulted in a decrease of 550 cars, or 30 per cent of this commodity. Apple unloads dropped about 8 per cent to 2570 cars, of which New York furnished 1454, Washington 529, Delaware 128, West Virginia 95, and Pennsylvania 88. There were decreases of 100 to 150 cars in potatoes, lemons, strawberries and onions, and smaller reductions in a number of other commodities.

Indian Neck Farm

(Continued from preceding page)

he married Sarah Malone, who was the mother of Abner and Sarah. Later he married Esther Kimble and had seven children; but it is of Abner, son of Sarah Malone, we wish to speak. He married Abigail Walton, of Byberry, in 1804 and it might be interesting to note that their marriage certificate is still in possession of the family. It is heavy parchment brown with age, closely handwritten in beautiful script, with a long list of signatures of the witnesses present.

They had three children, Eber, Joseph, and Mary, who married Ezra Walmsley. At this time the entire tract of land composing this neck or peninsula, was all in one farm, but Abner, upon the marriage of his boys, divided it into two farms, and built another set of buildings for his eldest son, Eber. This is the farm now owned and occupied by T. Morrison Slack; Joseph, who married Angeline Kirk, daughter of a neighboring farmer, remained on the home farm.

Descendents of Joseph Worthington

He had four children, Sarah, who married Samuel Kirk; Wilhelmina, who married Josiah Roberts; Amos Kirk, who married Rebecca Puff; and Emma, who married Spencer Worthington. A. Kirk, the only son, and his wife, Rebecca, had two children; William, who married Virginia Dudbridge, and Angeline, wife of Edward Carl. William is the present owner of the farm and has two sons, Addis and Francis, who are both at home, the sixth generation which has lived on the old farm, upon which the old house still stands, altho it has been enlarged and improved.

The farm buildings have been improved by the building of a modern milk house, chicken house and silo; a water system has been installed which furnishes house and barn with water from an unfailing spring, and a gas lighting system has been installed. The farm has been carefully tilled and a regular system of crop rotation has been followed, the present owner specializing to some extent in potato culture. A large and luxuriant meadow has led to the increased attention it has received as a diary farm, and Mr. Worthington is very proud of his herd.

Now Visited by Pleasure Seekers

The location of the farm has kept it rather secluded in the past, but during the last few years many people have discovered the natural beauties of Dark Hollow and it has become a favorite spot for campers and picnickers. This has resulted in the bringing of many pleasure seekers to the neighborhood, as many as a hundred automobiles have been seen there at a time, while the crowds of bathers sported in the quiet waters of the Neshaminy.

Years ago the water here was very deep as a large dam had been built to furnish motive power for a mill a short distance below, but for years the mill has not been used, and the dam, not having been repaired, when portions have been swept away in the winter by heavy ice and freshets, has become quite low in places.—Wm. H. Worthington.

Does your Cream Separator *Separate* Money *from* you or *for* you?

A CREAM separator is supposed to make money for its owner—yet there are hundreds of thousands in use today losing money because of poor skimming. Their owners' profits are going into the skim-milk instead of the cream can. Here is an easy way to show up such cream thieves. Ask your De Laval Agent to bring out a new De Laval and try this simple test:

After separating with your old separator, wash its bowl and tinware in the skim-milk. Hold the skim-milk at normal room temperature and run it through a new De Laval. Have the cream thus recovered weighed and tested; then you can tell exactly if your old machine is wasting cream, and what a new De Laval will save.

Thousands have tried this plan and have found a new De Laval would increase their cream money from $25 to $200 a year. The new De Laval is the best cream separator ever made—the crowning achievement in 48 years of manufacture.

Guaranteed to skim cleaner

The new De Laval has the wonderful "floating bowl"—the greatest separator improvement in 25 years. It is guaranteed to skim cleaner. It also runs easier with milk going through the bowl, and lasts longer.

7 SIZES Hand-Electric-Belt $6.60 to $14.30 DOWN Balance in 15 Easy Monthly Payments

TOM OF PEACE VALLEY

By John F. Case

Copyrighted by J. B. LIPPINCOTT COMPANY

(Continued from last week)

THEN the game was on and the followers of Blanton settled down to groan in suspense or wake the echoes with mighty cheering. As the tide of battle ebbed and flowed, outweighed but not outgamed, Coach Roberts' lads fought in grim and stubborn silence, "Bull" Durham a tower of defense whenever threat was made. Time and again Durham saved the game by the sheer power of his stalwart body but strive as they might his mates could not score. Battered and bleeding at close of the first half the Blanton boys lay resting while Roberts praised, encouraged, called for the last ounce of fight. "A touchdown this quarter, fellows," he exhorted as the players went on the field. "You can do it! Fight for Old Blanton as you never fought before."

Before the Blanton followers a diminutive cheer leader held high a megaphone. Surely there was inspiration in the thought for as the ball went into play Pepper Manning shrilled the call of a cheer for Peace Valley. To Tom Woodson in the thick of the fight came the cheering and at its end sharp, reverberating, "Peace Valley! Peace Valley! Peace Valley!' Then high above the cheering came the wolf cry of Lame Bill Kidd, the cry with which he urged his hounds on to death or victory. As if in answer there was the clear call of a signal and with the leap of a panther Tom Woodson had the ball and was away. Down the field with the speed of a fleeing wolf, eluding every attempted tackle, Woodson went over the line for a touchdown while above the roar of the school's followers he could hear the cry of his mountain friend. With goal kicked and a seven-point lead Blanton played a defensive game such as never had been seen before, repulsing each savage charge while as in earlier play Bob Durham was the rock on which the enemy shattered, broke, and was sent reeling back. With such stubborn defense, morale of the Denman team was broken and before the game closed Woodson had gone over for another touchdown after a series of smashing attacks in which Durham, taking the offensive, had torn the opposing line to shreds. It was a deliriously happy crowd that set out for home and mingling together as friends of one community were folks of the Valley and the town. Never again would there be the same feeling of antipathy between dwellers in Peace Valley and their neighbors. And sensing this John Roberts realized that on that field had been won far more than a football game.

No man with courage but admires one who also shows bulldog grit or more striking display of heart and brain. Out of that stirring contest came Tom Woodson and Robert Durham, acclaimed impartially, with a new sense of comradeship. The stubborn pride of the older lad, the bitterness of defeated leadership, had kept him from making the apology he knew was due. But now the spark of manliness which John Roberts hoped to fan into flame glowed with a resolution suddenly formed. As the players left the field together Durham suddenly stopped and at Woodson's approach extended his hand. "Old man," said Tom's erstwhile enemy, "I take off my hat to you. You are one game guy. You won this game for us and I'd have given a leg rather than lose it. And I know why I got to play today. I just want to say," and the red mounted to "Bull's" grimy cheeks, "that I know I've done you 'dirt' in the past and I'm sorry for it."

QUICK to resent but quick to forgive the mountain dweller asks only sincere amends for wrongs done and Tom Woodson grasped the extended hand. The other players stopped to gaze curiously for with Coach Roberts they knew there was far more than the game's discussion.

Who Is Your Most Interesting Friend?

THERE are farmers in Pennsylvania who have been Arctic explorers, travelers in strange lands of the Far East, aviators, engineers. There are doubtless others, both men and women, who have had careers more interesting than any fiction in many parts of the world. Still others have done interesting things on the home farm. They have become skilled naturalists, they have conducted outstanding experiments with plants and animals, they have plunged in some line of farming and become rich, and plunged again and become poor.

Pennsylvania Farmer will give a prize of $5.00 for the best letter on this subject:

The Most Interesting Farmer I Ever Knew

Other letters which are published will be paid for at space rates. Writers may sign a pen name to be used if their letters are published. Letters should not be longer than 300 words, and should be in our hands by March 6th. Address them to WEEKLY CONTEST EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

"Forget it," replied Tom, "for if it is true that I won the game you saved it many times. As for our other trouble, that's water gone under the bridge. We'll fight for Old Blanton instead of fighting each other." Close friends they would never be but mutual respect is akin to friendship and John Roberts knew that the feud was ended and that henceforth there would be no factionalism and that "Wasps" and "Grubs" soon would be but a memory.

In the coming days of school Robert Durham strove manfully to deserve the respect and esteem of the man whom he admired. It is true that there were lapses when the arrogance of old appeared, when boys of the school would have flocked to his leadership as Johnson, ever the craven but eager to win power again, strove to rub raw old sores. But it took but a quiet word from the teacher, a friendly boost and a warm handclasp as Durham reached new heights in basketball, to win back the lad who once a destroying factor now was a source of strength to the school. And as factionalism had disappeared so, too, had faded into oblivion the "Grub" as well as the "Wasp" society. Tom Woodson had his warm friends, drawn by his magnetic personality, Robert Durham his little circle of lads who admire brute strength above all other things. But there was but one recognized leader, the clean-cut, forceful chap who still but little more than a boy himself was not only teacher but the commander of a united force. And as it had done on the athletic field Blanton High went on to new honors in scholastic attainment.

AGAIN had come the time for the gathering at Cardwell, Farmers' Week, but this time Blanton decided to invest donations in needed school equipment and sent no team. Announcement of winners in the state corn contest was to be broadcasted by the powerful Cardwell radio station. By public subscription the Blanton class in agriculture had installed a receiving set and one of the proudest moments of Tom Woodson's life had come when with cash in hand he put his name down for a substantial sum. The school house was crowded when after preliminary announcements the chairman at distant Cardwell called the name of Secretary Campbell who had "important information" to send out. Tense and silent sat Roberts and his students as clear and strong the voice of Campbell came to them.

"In the state corn yield contest," began Campbell, "Vincent Richards of Malden, our county of most fertile soil, takes first place with an average yield of 125 bushels on his five-acre plot. To Vincent goes the Corn Growers' Association trophy, our special prize, and the $500 so generously offered by the National Machinery Company. Congratulations to Vincent who no doubt is listening and to County Agent Arnold Bennett who supervised his work." The cheers and handclapping of the great audience could be plainly heard and Roberts and his boys with their own audience joined in paying tribute to a winner far away.

"The award of second prize," went on Campbell, "is of unusual interest because it was won by a lad of the hill country in a county that unlike Malden is not famed for agriculture. To Blanton High School of Randall County goes the $100 library offered for the highest yield produced by a student of vocational agriculture. This student and the winner of second prize of $250 in the open contest is Thomas Woodson of Peace Valley. Congratulations to Tom and the school and to 'Fighting Jack' Roberts of Cardwell U., the vocational teacher who helped make this winning possible. The yield is a fraction more than 124 bushels an acre." Then an unofficial chuckle and for their ears alone altho all the world could hear, "Bully for you, Jack, and your young wildcat!" A second later, "Third prize was won by—."

Bam! The Blanton gathering exploded like a giant firecracker and whatever the further announcements they were forever lost. The center of a mass of shouting students and applauding grownups who fought to shake his hand or pound his back Tom Woodson found himself lifted bodily to the platform while shouts of "Speech! Speech!" rent the air. Here was a greater test than on the football field and Tom nervously shifted from foot to foot as the crowd grew quiet. Then in a voice hardly audible he began:

"Friends," said Tom, "I'm proud to win for Old Blanton and for Peace Valley but I don't deserve any credit. I just did as I was told, worked hard and did my best. Professor Roberts and Mr. Sheldon who sent me my seed corn, they made all this possible. Yes," and Tom began to lose his embarrassment as he looked into friendly faces alight with interest, "and Mr. Saunders who encouraged me and Mr. Farnham who bought my corn. I want to thank all of these men who take an interest in boys and help 'em succeed. And I owe a lot to my friends in Peace Valley and to you friends here who have been so good to me. I want to thank all of you. Gee!" and now Tom was just a boy among his fellows, "it's fine to have friends. Just about the finest thing in the world. I thank you." Amid heart warming applause Tom climbed down while John Roberts led the school and the audience in fifteen rousing 'rahs and a tiger for the lad who had fought and won. Nor was there one who cheered louder or more sincerely than "Bull" Durham.

AS THE crowd dispersed after an hour of jollity and celebration Roberts with Tom stood in the door watching the students file down the steps. Amid the chatter of the boys and girls they heard the sneering laugh of George Johnson, the one lad who had refused to cheer when Roberts had led the crowd in honoring Tom. "Can't tell me that darned 'Hill Billy' won fair," Johnson was saying, "those crooked judges just gave it to him and Roberts." A hand shot out from the crowd, a foot was planted where it would do the most good, and Johnson went hurtling down the steps while above "Bull" Durham glowered and commanded, "Shut up your trap! Don't let me hear another word against the 'prof' or Woodson." And if the act deserved punishment, Principal Morton apparently was looking the other way.

The regeneration of Bob Durham seemed near complete.

During the celebration three telegrams had come to Tom from friends who had heard the announcement. And next to the warm words of commendation from his teacher friend Tom reassured most the message that said: "Congratulations. You'll make a man. Keep the recipe. John Sheldon." From Supervisor Saunders: Proud of Jack's protege. Knew you'd do it, I know the breed. Good luck." And the final message from "Jum" Farnham who had heard the story at Cardwell U.: "Bully for you," Farnham had wired. "Football spirit. Now off for another touchdown." Asleep at home were the folks of Peace Valley for radio had not penetrated that peaceful fastness but a phone message from Pepper Manning to Tom's dad as the Blanton celebration went home had set all the Valley aflame and the folks of the hills were holding a celebration all their own. Even Grandad Martin had been routed from his bed by the hilarious Lame Bill and told the news. "Cain't beat a Coon Creeker," Grandad chuckled, "I allus allowed that boy could grow corn after watchin' me who's growed it fifty year."

MORE than a corn growing victory had been won. Roberts and Tom Woodson now knew that even as in the long ago an earnest student who had been fisherman had been won to another calling by his teacher friend, so had the son of a hunter-fisherman been won to a master's cause. As man to man that night John Roberts had talked to his pupil, planning the years to come. "Even with the money that you will give your parents," Roberts had said, "and I honor you for that, you still will have a snug sum to invest after paying all expense in high school this year. We'll put that to working against the time you enter Cardwell U. to work for the football honors that old 'Jum' predicts for you and the bigger things that college training gives. And we must add to it every year. This coming year you'll have swine project work and to your dad's little farm goes the best brood sow from my old home. Hold on," as Tom started to protest, "you can pay for her. We'll put in some pasture mixture for temporary use and I've a hunch that we can get an alfalfa stand. That field of yours is good for another whaling crop of corn before we turn it to something else again. We'll show your folks something in the hog line beside razorbacks.

"Old man," and Roberts emphasized his words with a friendly pressure upon his young friend's knee, "it's up to you to lead your people in the paths of agriculture. The fur crop is failing and the folks of Peace Valley must turn to the soil or abandon the homes they love. Here at home, Tom, is your mission in life." Roberts paused to apologize for his earnestness but as one who sees visions and dreams dreams, Tom Woodson was looking into the coming years and seeing first the towers and columns of a great University, then in a quiet valley, fertile fields, green pastures, happy and contented children abiding prosperity for those he loved and served.

NOW all the hill country was wild with enthusiasm for was not a son of the Valley who had triumphed over those "Outside" coming home for the laurel wreath of victory? Tom had chosen to have the formal honors of the state award with the medal bestowed upon winners and the check to be presented in the little Valley church. There with Supervisor Saunders, with the officers of the Corn Growers' Association, and with other distinguished guests who had come to do him honor the clans of hill and Valley had assembled to greet a lad they loved. To the last man, woman and child they were there with Lame Bill Kidd resplendent in a flaming necktie and Grandfather Martin chuckling as if the thought warmed his rheumatic joints. "By golly they cain't beat a Coon Creeker!" Came until the room was jammed and long lines stood waiting to applaud as with John Roberts and Marvin Manning, while a proud father and mother walked on either side, Tom Woodson came home to his reward.

As Tom paused at the church door and looked down the Valley where still sentinel like the tall stalks stood he uncovered in spirit to the invisible things that had spurred him on. As never before he felt the call of soil and sunshine, the abiding promise that those who serve well the gods of agriculture will be well repaid. But above all Tom sensed realization of what he owed his mother for the heritage bequeathed and his mountain bred father for the inborn courage that never knows defeat. And how much he owed to his friends, to the small chum who had been his champion when all things were dark, to all those who had lent help and encouragement.

How fine it was to have friends, and home, and loved ones. And to have one older friend who had come to be more than blood brother. Again the friendly pressure of John Roberts' hand upon his shoulder as they passed within and as ever Tom thrilled to the touch while deep in his heart he vowed fealty to this man and to the gods of soil and sun and rain which were his gods. And it seemed as if the spirit of the mountain which had close guarded its sons and daughters as they went about tasks not akin to agriculture, looked down and even as Tom had, visioned green fields, more prosperous homes, happy children, and, smiling, was content.

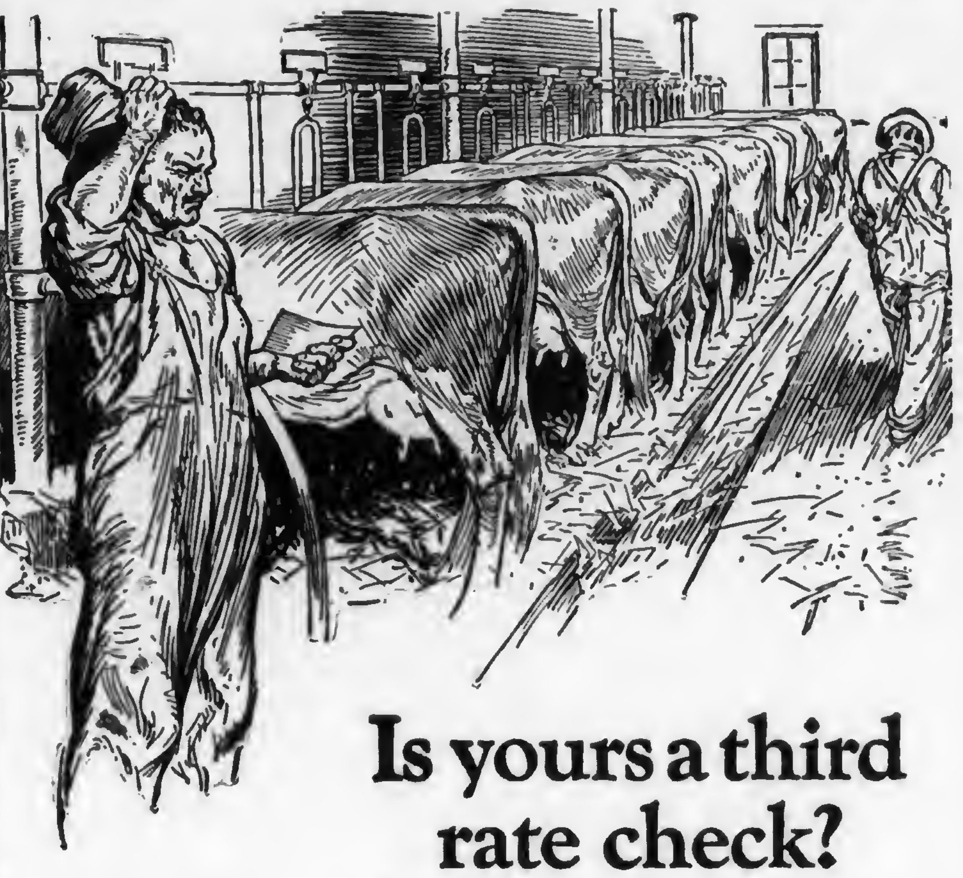
One out of every 200 persons living in the United States is put into jail every year. This does not include people who are arrested but released upon payment of fines.

* * *

The League of Nations is investigating the obstacles in the way of a reform of the calendar. It is proposed to divide the year figures into 13 months of 28 days each, with an extra day at the end of the last week in December, and a leap day at the end of June every fourth year. Under this plan any date always falls on the same day of the week. Bookkeeping and other records are greatly simplified by having months of equal length.

* * *

The Gregorian calendar, the one we now use, was introduced by Pope Gregory XIII in 1582 to correct an error in the old calendar, established by Julius Caesar in 46 B. C. The year established by the Julian calendar was eleven minutes longer than the astronomical year. This slight difference had displaced the vernal equinox ten days, so Pope Gregory straightened things out by ordering that October 5, 1582, should be called October 15th. He also made provision in his calendar to keep it from getting behind again.



Is yours a third rate check?

A national dairy paper quotes a farmer who says that too many men go to the labor and expense of *producing good milk*—and then take a third-rate product to the creamery.

This farmer has a cooling tank and uses it. On many modern dairy farms, electricity runs the cooling plant, milks the cows, separates the cream.

It insures to the farmer the best price obtainable for the quality he turns out.

You will find this monogram on motors, MAZDA lamps and other electric products that are used in modern dairies.

In sections where farms are electrified you will also find the G-E Farm Book used as a guide. Ask your electric power company for a copy or write us at Schenectady, N. Y.

THE PENNSYLVANIA FARMER PHILADELPHIA, PA.

OUR YOUNG PEOPLE'S FORUM.

Winning Letters in the "Winter Sports" Contest

FIRST PRIZE

Dear Cousin Betty:—How we do wish you could spend a winter out here on the farm with us. Winter is the greatest fun! We have a pond down in our meadow and the ice is just like glass. We younger ones got bob skates for Christmas. They told us you couldn't fall down on bob skates but they didn't know what they were taking about. We fell down about as fast as we got up, at first, but it didn't hurt much. Now, you should just see us skate. I hope we get some regular skates soon.

Sometimes big brother pulls us behind him on our sleds and how we do fly. On real cold days brother builds a bonfire right on the ice to warm our hands by, and then maybe mother lets us take doggies and roast them over this fire.

We have had lots of snow this winter. We have a dandy big long hill and brother and sister take their big flyer, we twins take our arrow and Davy takes his coaster and we start at the top of this big hill and whiz, we go all the way to the bottom. It seems just like flying. Lots of times we go out coasting by moonlight.

One day we had a regular blizzard. We couldn't go out so while the wind roared and the snow blew outside mother let us pop corn, crack nuts, roast apples and make candy. The next day you should have seen it. Snow was just piled everywhere and the drifts were as high as the fences. We kids dug paths all around first, then we made a great big snow man, as tall as father, himself, and then we made snow forts and had a sham battle.

And we dug caves, too, in some of the big drifts and played we were cave men. Do you know how to make angel birds in the snow? Well, you lie down and spread out your arms and wave them to make the wings and then you get up very carefully and there you have the angel birds. We write our names in the snow, too. The wind will come along and blow them out just like the waves do at the seashore, when you write them in the sand.

Sometimes father will take a walk with us and tell us about the different tracks in the snow. You wouldn't think that the tracks of all the little birds and animals could be so different. We always take feed along and throw it around for the birds. We are trying to learn to walk on snowshoes—it is lots of fun but pretty hard work to do.

And we mustn't forget to tell you about our sleigh rides. Father gets the old sleigh out and hitches up old Ginger and I guess old Ginger has as much fun as we do, for he jumps and makes the sleigh bells jingle and then we all sing and holler as we dash along thru the drifts.

Oh, winter is just the most fun and we shall be so sorry to see it go. Your loving cousins, Phebe and Priscilla Gardner, nine (X), Mercer County, N. J.

Honorable Mention

Pearl May Amos, ten (X), Washington County, Pa.

Ralph M. Amos, twelve (X), Washington County, Pa.

Russell Cornbower, nine (X), York County, Pa.

Irma Creveling, fourteen (X), Bucks County, Pa.

George Dersch, eight (X), Gloucester County, N. J.

Sara Gelnett, ten (X), Perry County, Pa.

Raymond Guillaume, thirteen (X), Lycoming County, Pa.

David Edwin Moyer, thirteen (X), Montgomery County, Pa.

Willard N. Moyer, fifteen (X), Montgomery County, Pa.

Weaver Zimmerman, fourteen (X), Lancaster County, Pa.

Martha E. Zook, thirteen (X), Mifflin County, Pa.

SECOND PRIZE

Dear Vera:—I am sure you would enjoy being with me during the winter season. I am sure if you would be in the country a month or so you would not mind a few of the many bumps you would receive while coasting. Well, I cannot say much about this year yet as we have not had much snow. But I am sure you can expect accidents. You can also expect to buy more shoes, rubbers or arctics.

There are many ways of having fun. Last year we went on a steep hill and had our sleds, and bags filled with straw, along with us. I can still remember the first ride I had on a bag. I thought my heart was in my throat. The bag went from side to side, backwards, and anyway but straight. We also went coasting in boxes. We sat in the box and started on the top of the hill. Sometimes there would be a nail in the box and it would catch in the crust, this would mean a few bumps.

Last year my twin sister and I started on the top of the hill, I went first. At the bottom of this hill is a stream of water which was partly covered with ice. On the other side of the stream was another hill. When I came across the stream I looked back to see if Ruth, my sister, was coming. She was about half way down the hill and going about as fast as I was, which was not very slow. I turned around on the other hill and had intended to go as near to her as I could, but she was going so fast I could not get out of her road and the next thing I knew I was lying over on the one hill, Ruth on the other, and our caps were about one and a half yard from where we were. The guiders of our sleds were broken, and my sled was in an awful shape. We also felt as if our bones were broken.

We were so scared and dizzy we could hardly talk. But we passed it off the best we could because my older sister was coming toward us over the field. Ruth and I both sat down on my sled and laughed, but I am sure it was nothing to laugh at.

Almost every year we have sleighing parties, we are going to have one the next time it snows. We also coast at school as there is a long, steep hill right across from the school ground. Well, I am sure you are tired of reading so I must close, wishing you were here.—From your friend, Helen Heffner, thirteen (X), Schuylkill County, Pa.

THIRD PRIZE

Dear City Friends:—I am going to write and tell you what a grand time I am having this winter on the creek near my home. It is called the Big Buffalo Creek.

I have no skates so my mother made our dog a set of harness and I hitch him to brother's sled and he pulls me up and down the creek. One afternoon mother and brother were skating, mother got so tired I coaxed her to sit down on the sled and away ran my dog pulling her on the sled. We sure did laugh. Our dog is a big Collie, his name is Floppy. We sure love him.

When brother and I coast down hill Floppy runs after us barking and tries to catch us, he bites us pretty hard but he is just in fun.

I wish you could be here. We would soon get acquainted and have loads of fun.—Leona T. Blaine, eight (X), Perry County, Pa.

Plan Homes for Birds

(Continued from last week)

I ALWAYS take the houses down in the fall and clean and paint them and then hang them again about March first. In this way they last longer and are kept in good condition.

Any one wishing to know more about birds and the sizes to build the houses and to make the opening can procure valuable information by writing the Department of Agriculture, Washington, D. C., for all the available information on attracting and protecting the birds.

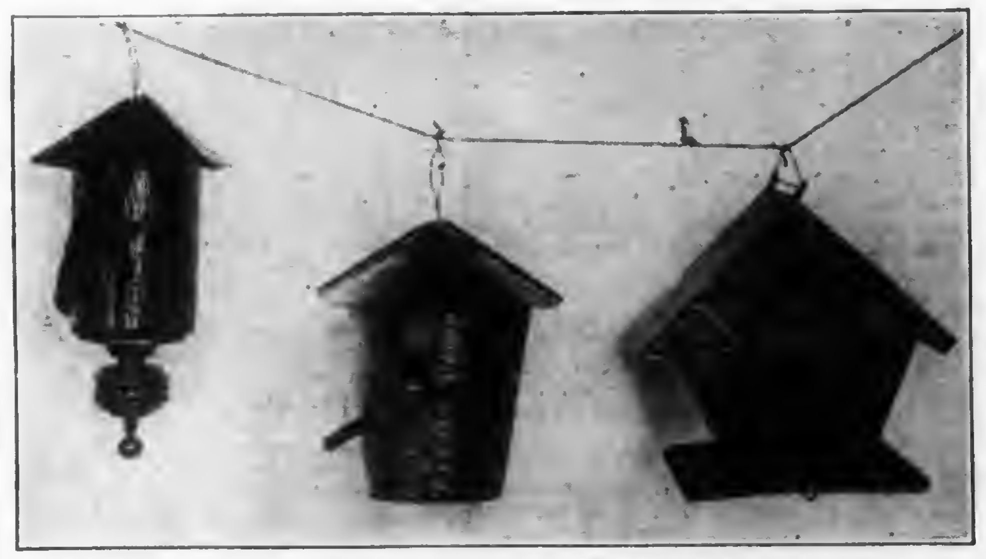
My hanging houses for wrens are neat and attractive and are made from black roofing paper. Two boards were cut circular, the bottom one four inches in diameter, the top, five inches; then about six or eight strips of light wood cut seven inches long and one and one-half inches wide were tacked around the circular pieces. This makes a frame. Then a wire for hanging was fastened in the top board and a piece of roofing paper cut and tacked around the frame.

A one-inch hole was made so it will go thru one of the strips of wood about four inches from the bottom. For the roof a circle is cut from the roofing paper, which is eight inches in diameter, then a cut is made in the circle of paper from the edge to the center; the cut edges are lapped over enough to make it fit the top of the house forming a nice little roof. Cut a twig from a tree and tack below the opening for a perch.

A bird bath in the lawn, will be greatly enjoyed by the birds. I made one, a pan twenty inches in diameter and two inches deep, from a sheet of galvanized iron.

A stake was driven in the ground and a six-inch joint of tile pipe put over it so it could not blow over. The pan was then placed on the tile. The outside of the pan and the tile were painted stone color.

Different kinds of birds come to the bath and they surely enjoy splashing in the water—M. A. K.



Three homes for wrens. The one on the left is made from a baking powder can. In the story this week you'll learn how to make the one in the middle.

The Contest

WHAT a splendid time I've had reading the letters you wrote your imaginary city friends about "Winter Sports." It would be fun to combine the best parts of a lot of the letters and make one long letter (I'm not going to attempt it, tho!) then our city friends would know all the interesting things that go on in the country when there's ice on the ponds and snow on the hills.

This week I'm printing only the three letters that won the prizes but I hope there'll be space later to print some of those written by the Forum friends who received Honorable Mention.

The list of those who entered the "Winter Sports" Contest will be published next week. COUSIN RUTH.

OUR LITTLE FOLKS' PUZZLE CORNER

DEAR LITTLE FOLKS:—Well, this looks queer, doesn't it? The four words in this week's puzzle have nothing to do with a private message, in fact almost everybody in the world who speaks our language and many people who speak other languages would recognize the two words I want you to get out of these four mysterious words. The letters used in the four words in the puzzle can be rearranged to form the first and last names of a very famous man—a man whose name you and many millions of people know very well. Even if you have just become one of Our Little Folks and are just beginning to have the fun of solving these weekly mysteries, I feel certain that some day this month you will mention this man's name. When you have found the name send it to me on a POSTAL CARD so that it reaches me by February 27th. BE SURE TO SAY HOW OLD YOU ARE. The ten children, sending in the correct answer, whose cards are the best in grammar, spelling, punctuation, penmanship and general appearance will each be awarded a set of pictures.

The Honor Prizes, bright and shiny pencils with a supply of leads, go to those Little Folks who send in correct, excellent answers to ten puzzles for ten straight weeks without missing,—one each week. Please remember that in order to win an Honor Prize your answers must be absolutely correct each week. Mistakes in spelling, punctuation, and failure to mention your age every time are only a few of the many errors that are made weekly.

Address all replies to the PUZZLE EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

The answer to the puzzle published in the January 30 issue of Pennsylvania Farmer is: 10 multiplied by 10 minus 10 divided by 10 equals 9.

The puzzle prize winners are: Catherine Baker, age 8, Smithburg, Md.; Ernest Beaston, age 10, New Germantown, Pa.; Linwood Doody, age 10, Eden, Md.; Viola Foust, age 11, Hadley, Pa.; Margaret Hambleton, age 9, Greene, Pa.; Pauline King, age 10, Gaithersburg, Pa.; Ivan C. Miller, age 9, Lancaster, Pa.; Mae Morrison, age 8, Transfer, Pa.; Humbert Pugh, age 7, Trappe, Md.; Melvin Simpson, age 9, Gordonville, Pa.

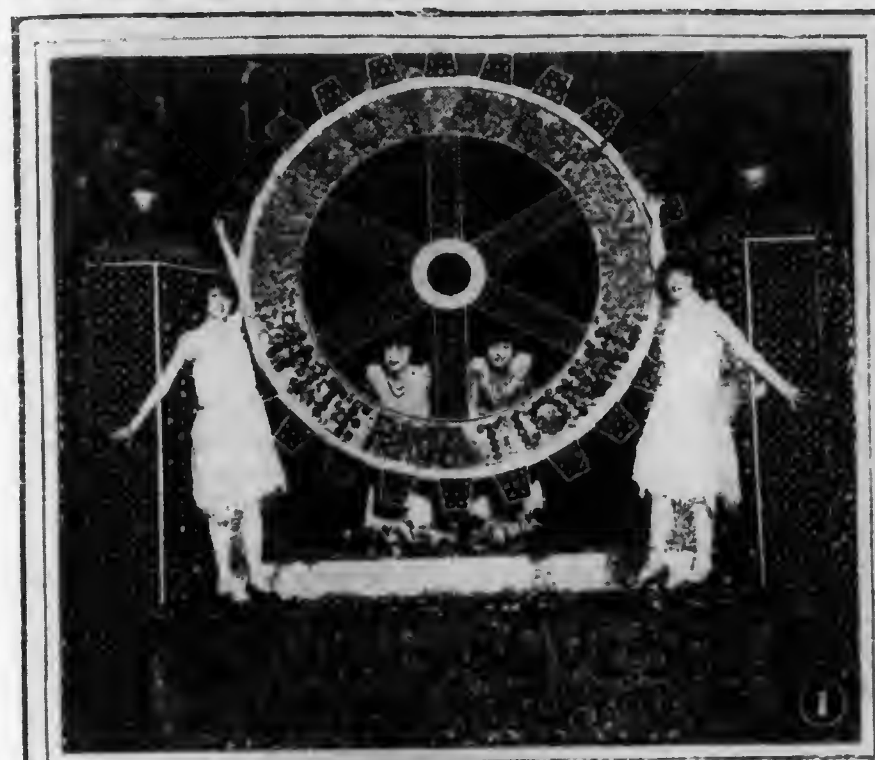
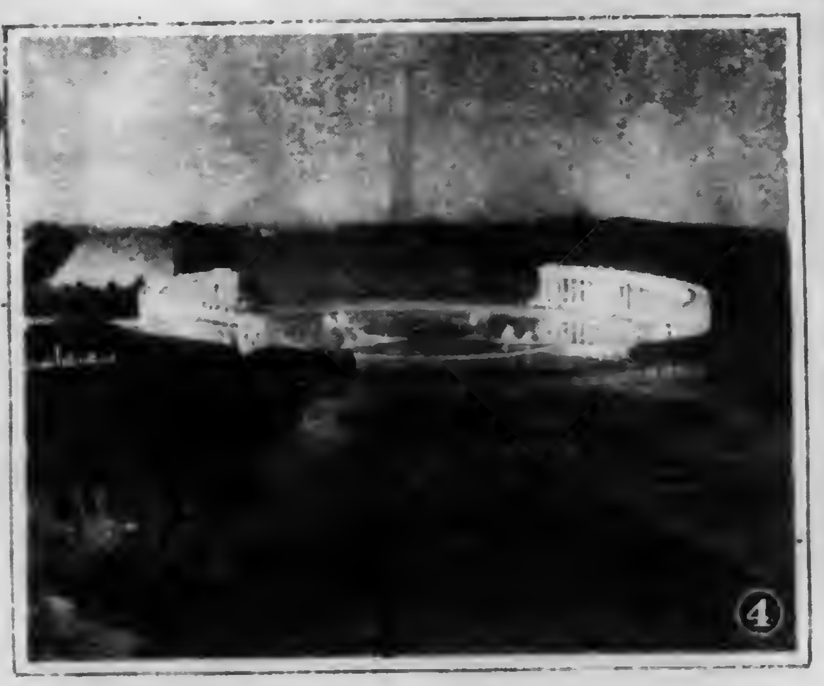
PASSING EVENTS IN PICTURES





1.—The familiar Rotary Club wheel done in oranges was one of the outstanding features of the recent southern California fruit show.

2.—The WGY Players, famous "radio actors." The man seated in the center is Witter T. Cook, author of "The Hidden Idol." The presentation of this play in the WGY studio was described in a recent issue.

3.—Miss Burnita Shelton Matthews, president of the Woman's Bar Association of the District of Columbia, holds an important place among the women lawyers of the country.

4.—The prize winning Roosevelt Memorial model designed by John Russell Pope.

5.—Little Jiro Matsudaira, baby son of the Japanese Ambassador to the United States, all ready for a snowball fight.

6.—One of the old model log cabins of Washington's Headquarters at Valley Forge. In the original cabin Washington held meetings and councils of war during the terrible winter of 1777.

7.—This old block house, at St. Paul, Minnesota, could tell many hair raising tales if it could speak.

Fine Large Chrysanthemums

And How to Grow Them in Your Own Garden

FINE large-flowered chrysanthemums can be grown in one's own garden with a little care. When planting, dig the soil very deep and add a liberal amount of well-rotted manure, a little lime and some wood ashes. Then blend and thoroly pulverize the entire mixture. Set out the plants eighteen inches apart the latter part of April or first of May. It is wise for the beginner to choose early blooming varieties, as they will perfect their blooms before frost. Lillian Doty-white, and Lillian Doty-pink are very satisfying to amateurs.

When the plants are four inches high, pinch out the top so that the lateral branches will start out from the main stem. If fewer than five of these starts appear, then in about a month pinch out each branch top. Strong plants can care for from five to eight fine flowers. If smaller flowers are wished, pinch oftener, but never later than August 1st. Having now as many flower branches as you desire, keep all other growth plucked closely away.

Pink beauties four inches across.

Cultivate lightly about the plants and more deeply between them, keeping the soil loose at all times. About July 1, give a good top-dressing of well-rotted manure. Early in August, work into the soil at a safe distance from the plants, a good fertilizer for flowers. After this, mulch weekly with lawn clippings to conserve moisture and save future cultivation. During dry spells, keep plants well watered. Several kinds of pests are liable to appear, but are easily controlled by dusting with tobacco dust or using a tobacco spray.

Watch for Terminal Buds

The amateur should watch for the terminal buds which appear in clusters. Select the finest one of the cluster and carefully remove the others. This pinching should be done as soon as possible, allowing but one bud to each stem. It requires a follow-up, too, for new growth will need removing every few days. Take care, tho, of the tender leaf growth, for leaves set off the flower when it opens.

If you like beautiful flowers for Thanksgiving, select a plant or two of the variety we photographed for you. They are pink beauties, measuring four inches across, and called the Mrs. E. A. Siedewitz. Plant them in ten-inch pots using good new soil blended with a little bone meal and some well-rotted manure. Dig a hole out in the open and after throwing in a quantity of wood ashes, set the potted plant down and pack the earth around it filling up almost even with the top. Attend to the watering carefully, and prune in the same manner described for other varieties.

This variety can support a dozen branches if you give it good care. My plants last year produced nine four-inch flowers and four or five smaller ones. As soon as buds appear give a weekly watering with weak manure water. As soon as frost threatens, lift the pots, and carry them into shelter for the night, returning them to the open in the morning. About November 1, move them permanently to a sunny window of a cool room, where you will soon have a fine reward for your labors.

Start New Plants Yearly

To have fine flowers, new plants must be started each year. Keep the old plants in a cool, light place thru winter. In March make cuttings about three or four inches long and place them in an earthen vessel in water, near the light but not the sun. When the cuttings have rooted (about two weeks), plant in small pots, shifting to larger pots when time to set out-of-doors. If tender varieties of early flowering kinds are raised, a plant of each can be lifted in early autumn to save for March cuttings.—Mary A. Kintigh.

Another Library Book

THE increasing popularity of our circulating library is very gratifying to us all, and a splendid tribute to Mrs. Harrington, who started it for us. It also testifies to the splendid caliber of our women. We are placing a new book on the shelf this week, and the complete assortment now is:

The Woman of Forty, by E. B. Lowry, M. D.

Your Child Today and Tomorrow, by Sidonie M. Gruenberg.

Getting Ready to Be a Mother, by Carolyn C. VanBlarcom.

Cooking for Profit, by Alice Bradley,

and now the additional one,

More Baskets and How to Make Them, by Mary White.

To obtain any one of these books, send your request, together with fifteen cents to pay the postage and insurance, to Editorial Department, Pennsylvania Farmer, 261 S. Third St., Philadelphia.—Gertrude S. Stewart.

Two Candy Recipes

WHITE TAFFY

2 cups of sugar
2 tablespoons of vinegar
1 teaspoon of lemon extract
1 teaspoon of cream of tartar

Add a little water to moisten sugar, boil with vinegar and cream of tartar without stirring, until brittle when tried in cold water. Add flavoring, turn out quickly on buttered plates. When cool enough to handle pull until white, and cut into pieces.

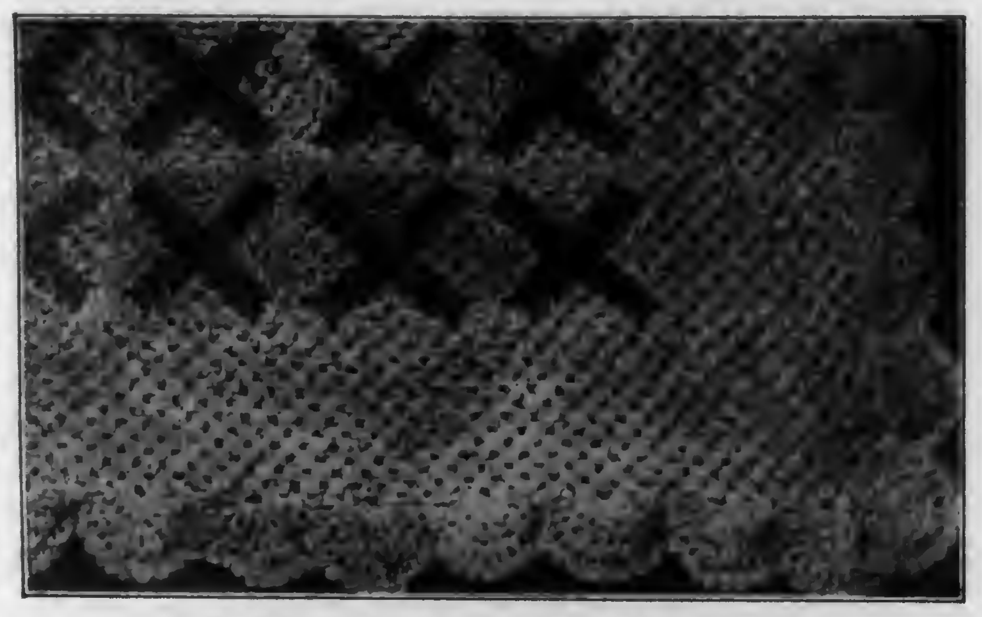
PENUCHE

2 cups of light brown sugar
⅓ cup of milk or cream
1 tablespoon of butter
¾ cup of chopped nuts
1 teaspoon of vanilla extract

Put sugar, milk and butter into sauce pan. Boil with as little stirring as possible until it makes a soft ball when tested in cold water. Take from fire, add nuts and vanilla, beat until thick and pour into greased tins.—Kathryn Albright.

Two-Purpose Crocheted Robe

CROCHETED robes have always been popular and very convenient to have around the house on cold wintry days or to throw into the car when going for a long drive. The robe illustrated is quite out of the ordinary. It was copied twenty-five years ago from an old robe brought to this country a long while ago. The body or foundation is made from gray and white mixed yarn—the crosses alternating, red and green.



A robe out of the ordinary for cold wintry days.

Each little square is made separately and joined later. The blocks are sewed together, seven wide and fourteen long, unless large size is desired. When sewed together you will have solid and open meshes around the robe, into which the border can be crocheted.

An attractive carriage robe for the baby can be fashioned by using white zephyr for the foundation and pink or blue, or both, for the crosses.

Red—ch 3 and join, dc 3 ch 1, dc 3 ch 1, dc 3 ch 1, dc 3 ch 1, dc 3 ch 1, dc 3 ch 1, dc 3 ch 1, dc 3. Second row: red—dc 3 ch 1, dc 3 ch 1, dc 3 ch 1, dc 3. Third row: red—dc 3 ch 1, dc 3 in 1st ch in second row. Take up gray yarn, ch 1 dc 3, ch 1 in 2nd ch. Repeat 4 times. This starts your red cross. Fourth row: red—dc 3 ch 1, dc 3,—gray— dc 3 ch 1, dc 3 into 2nd and 3rd ch 3rd row, repeat four times. Fifth row: red—dc 3 and ch 1, dc 3 over 1st ch, gray: dc 3 ch 1 into next 3 chs. Fifth row will have one more gray mesh in each section. Next block will have green substituting red.

When the blocks have been sewed together with yarn used in the foundation of the robe, start at the corner and dc 3 in every open mesh around the cover, ch 1 between each 3 dc. Repeat 14 rows. If preferred, the border can be crocheted in stripes, a row of red and a row of green, with the gray between. Finish with any ordinary scallop.—G. S.

To Prevent Monotony

HERE are some variations to prevent monotony in the many desserts of rice, cornmeal, graham bread, and other cereals which Marie C. Doermann, New Jersey extension foods specialist, suggests.

Instead of raisins, which are usually added to rice pudding, one can substitute dates, figs, maple sugar, or candied fruits. The plain pudding served with canned fruit also is delicious.

A Variety of Puddings

Baked Indian pudding is another stand-by for supper on cold nights. Bread pudding made with graham bread in place of white gives a pleasant change in flavor and color. Left-over oatmeal and other cereals may be made into favorite desserts by the addition of milk, eggs, raisins, and flavorings.

With any soft dessert it is well to serve a crisp cookie or cracker rather than soft cake with frosting. The contrast in texture makes an agreeable combination. Scotch wafers are appetizing to serve with many desserts. They may be made from the following recipe:

2 cups oatmeal
2 cups flour
¼ cup sugar
1 teaspoon salt
⅛ teaspoon soda
¼ cup butter or lard
½ cup hot water

Mix the first five ingredients. Melt the shortening in water and add to the first mixture. Toss on a floured board, pat, and roll as thin as possible. Shape with a cutter, or cut in strips with a sharp knife. Bake on an oiled or greased tin in a slow oven. These are excellent for children's luncheons.

A Valuable Bulletin

I HAVE had so much help from Circular No. 109, Cottage Cheese Dishes, that I just must pass the good word along. Send your request to the United States Department of Agriculture, and obtain this valuable bulletin. You will be surprised at the great variety of good things it tells you how to make.—Mrs. M. P. C.

The So-Called Cross Child

Isn't It Often Because He's the Too-Tired Child?

MANY mothers fail to realize that a child does become too tired. The result is usually the same—a so-called cross child.

Children are active and tear down tissues, the same as adults do. These must be rebuilt, and in addition children are constantly growing so that it is imperative that they have plenty of rest.

The child up to ten years should sleep the clock around at night, and if normal will usually do so. Occasionally we find a child that seems to be a poor sleeper. Upon examination there usually is found to be a good reason.

The child under six years should sleep each afternoon. The power of suggestion and habit have a good deal to do with afternoon naps. My children knew nothing else until six years. They expected to go to bed after dinner and sleep.

My Laddie Is Right

My laddie, who is now five, insists that if he does not get his afternoon sleep he willl be so tired and cross no one can live with him—and he is right about it.

There have been times, of course, when the children decided they did not wish to sleep in the afternoon. Then was the time when Mother's brain had to work quickly—and make them decide they did want to sleep.

I find that if I read to small son for a half hour after dinner he is usually drowsy by the time the reading is finished. Before I begin I say: "Well, Mother will read all this story to you before you go to bed"—suggestion, you see, and almost always the child marches up the stairs with no further discussion about it. He sleeps from two to three hours every afternoon, and is ready for bed again by seven-thirty.

If the child is very active many times he will become too tired if allowed to play hard all thru the morning. It is better to stop in the middle of the forenoon, read a bit to the child, or give him some quiet work to do.

Many times a so-called cross child is only a too-tired child, and this could have been prevented if the mother had watched the child and planned his day more carefully.—May H. Mumaw.

Just to Remind You

THE sewing contest announced in the February 6 issuo is in merry swing, and soon we shall benefit by the first letter to win prize scissors. Was there ever a woman who couldn't use just one more pair of good scissors?

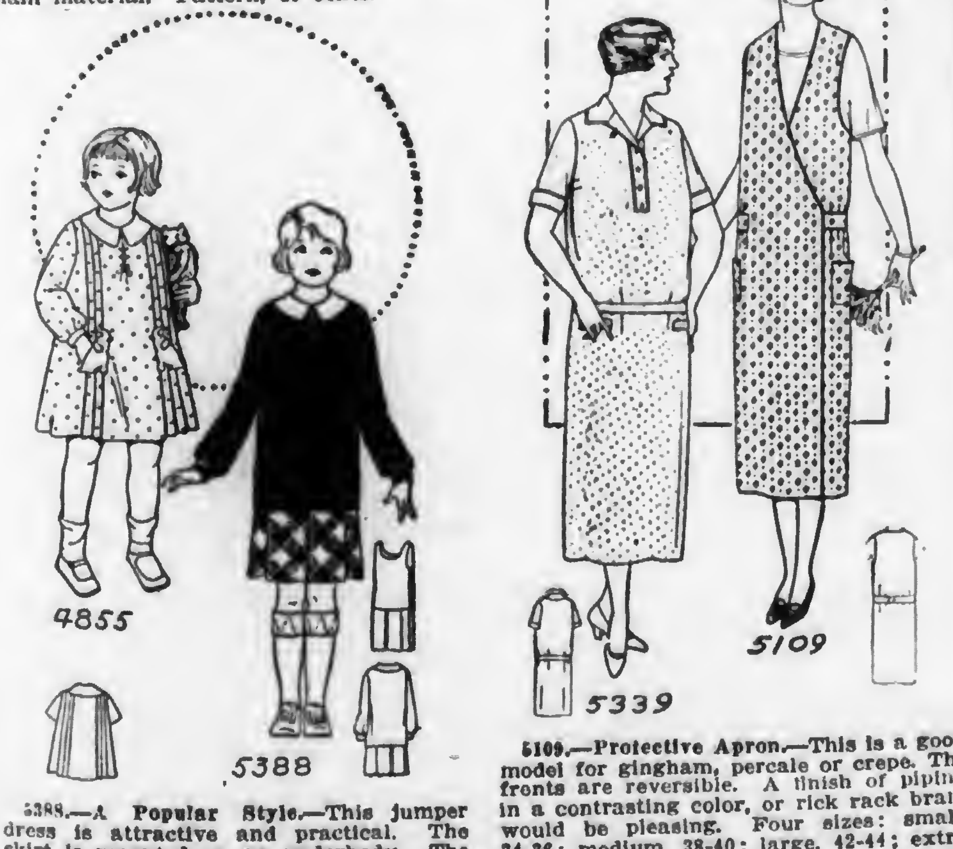
When you compete in this woman's exchange of original helps in sewing, observe these few rules:

1. Keep your suggestions within the 200-word limit.
2. Use typewriter if possible. Otherwise write on one side of paper only.
3. Let originality be the keynote.
4. Address your answers to Sewing Contest Editor, Pennsylvania Farmer, 261 S. Third St., Philadelphia, Pa. — Gertrude S. Stewart.

Want Something Practical?

Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

4855.—Frock with Picture Pockets.—Dotted percale or swiss, with collar of linene or organdy, could be used for this style. The sleeve may be in wrist or short length. Four sizes: 2, 4, 6 and 8 years. A 4-year size requires 2⅝ yards of one material, 36 inches wide. To make as illustrated, will require 2⅛ yards of 36-inch figured material, and ½ yard of plain material. Pattern, 10 cents.



5388.—A Popular Style.—This jumper dress is attractive and practical. The skirt is mounted on an underbody. The dress may be made of one material, or as here illustrated of plaid and plain goods. Four sizes: 4, 6, 8 and 10 years. An 8-year size requires 1⅛ yard of 40-inch material for the blouse and ⅞ yard for the skirt, if made as illustrated. The underbody will require ½ yard of 36-inch lining. For facing on collar ¼ yard 9 inches wide is required. To make the entire dress of one material requires 2½ yards 40 inches wide. Pattern, 10 cents.

5339.—A Simple Morning Frock.—Percale, gingham or linen also tub silk or rep could be used for this model. Nine sizes: 38, 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. A 42-inch size will require 4½ yards 36-inch wide if made of one material. If made as illustrated it will require 4 yards of one material and ½ yard of contrasting material. The width of the dress at the lower edge is 1⅞ yard. Pattern, 10 cents.

5109.—Protective Apron.—This is a good model for gingham, percale or crepe. The fronts are reversible. A finish of piping in a contrasting color, or rick rack braid would be pleasing. Four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 5¼ yards of 27-inch material. Pattern, 10 cents.

Send 10c in silver or stamps for our up-to-date spring and summer 1926 Book of Fashions.

ECONOMY
IN COST-USE-RESULTS

—because Calumet is sold at the lowest price it is possible to offer a pure, dependable leavener. You get full value—full weight.

GOLD

Over Fifty Years of Growing Better

FOR over half a century the Goodyear "Gold Seal" line of super-quality rubber footwear goods has been constantly growing better.

Always noted for their excellent wearing qualities, even under the severest working conditions, these goods have been improved, year after year, assuring the customer *the best* the rubber-wear market affords. Today "Gold Seal" rubbers, boots and overshoes are as far superior to the very worthy product of fifty years ago as the modern, high quality cord automobile tire is superior to the old-fashioned fabric tire of twenty years ago.

When you buy rubber footwear for yourself or your family ("Gold Seal" goods are made for young and old) be guided by the more-than-fifty-years of experience that the "Gold Seal" trade-mark represents. This emblem is a guarantee of *satisfactory service.*

FARQUHAR GRAIN THRESHERS

May Be Operated by Farm Power

The "Farquhar Junior" Thresher is designed and constructed in full accord with the best experience of thousands of threshermen who have made money operating a threshing rig. Has a capacity of about 50 bu. per hour of average wheat when driven by the farm tractor or other light power. Equipped with hand or self feeder, straw carrier or wind stacker.

Write for illustrated Bulletin giving full information. Learn how easily you can thresh your own crop when it suits you best—thresh for your neighbors and thus make more days work for your tractor. We also build a tractor press for baling Hay and Straw.

Box 546 A. B. FARQUHAR., Limited
YORK, PA

Iodine Is Necessary

PEOPLE living along the seashore are rarely afflicted with diseases due to iodine deficiencies. It is said that in certain of the peninsula districts of Japan, goiter, which is a disease caused by insufficient iodine, is unknown.

In parts of the country which slope sharply toward streams and lakes, the wash of the elements drains the iodine content of the soil into the water and it is swept away. In such belts or regions goiter is almost certain to be prevalent. This necessary health ingredient is not found in sufficient quantities in the drinking water or in the vegetation, and as a result, humans, animals, fowls and fish often suffer from serious goiters.

It is a well known fact that those suffering from thyroid or goiter trouble suffer in point of health and are mentally retarded.

When iodine is lacking the young of some domestic animals are often born with goiters and enlargement may be of such a size as to make birth difficult and dangerous. Treatment with a small quantity of iodine works almost miraculous results in the way of relief.—E. G. W.

For Better Babies

MINERAL salts and vitamins of milk, eggs, vegetables, fruits, and whole grains build bones and teeth. Outdoor sunshine is necessary for the best growth, and the mother's sunning herself daily in the open air helps to prevent rickets in the baby.

Man has fifty-two teeth altogether, and they begin to form by the third month of prenatal life. All the first set of twenty teeth are inside the jaw at birth, and their crowns are almost completely calcified. By the time the first tooth appears, the enamel is all formed on the temporary set. Practically all the teeth are begun during the eighteen months when the mother is the main source of food for her baby. Good teeth protected by well-formed jaws depend on the abundance of calcium (or lime), phosphorus, and vitamins in the mother's food. Milk is the great lime food.

Thyroid Gland Needs Iodine

The thyroid gland, which is necessary for normal growth and health, must have a small amount of iodine. If this is not provided the thyroid enlarges and forms a goiter.

In certain regions, especially around the Great Lakes and in the Northwest, the water and soil have lost their iodine, so that foods grown in these localities may not provide the necessary iodine. At least in these regions, thruout pregnancy, iodine should be taken to prevent goiter in the baby as well as in the mother. Iodine should be taken only in minute amounts, usually in ten-milligram tablets (about one-sixth of a grain) once a week, or as iodized salt. Its use should be directed by a physician.

A Good Indoor Game

BLINDFOLD one of the players and give him a wand or light cane. The other players form a ring and circle about him singing a familiar song. When the singing stops, the blind man points his wand touching a player, who must then take hold of the other end of the wand and sing the first line of the chosen song, attempting to disguise his voice.

If the blindfolded player guesses correctly, then the one guessed becomes the blindman and the game continues using the second line of the song, and so on until all lines have been used. Then another song may be substituted. If the blind man misses his guess he tries again and again.—L. M. Thornton.

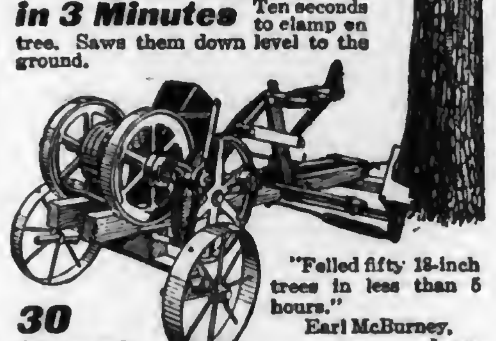
Does the Work of 10 Men!

WICO Magneto Equipped

Saws Wood Fast

This one-profit WITTE Log Saw uses Kerosene, Gas-Oil, Distillate or Gasoline and will cut from 10 to 25 cords of wood a day. Easy to operate and move. New device makes easy starting in any temperature. Trouble-proof. Fells trees and saws them into blocks—runs other farm machinery. Fast money maker and big labor saver. Completely equipped with WICO Magneto, speed and power regulator, throttling governor and 2 fly wheels.

Change to Tree Saw in 3 Minutes Ten seconds to clamp on tree. Saws them down level to the ground.



"Felled fifty 18-inch trees in less than 5 hours."
Earl McBurney, Iowa.

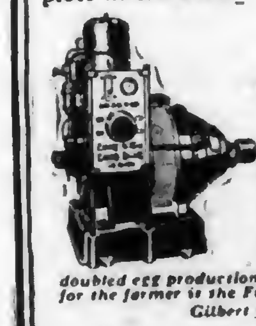
Electric Lights Increase Egg Production

It is a demonstrated fact that the proper use of electric light in the hen house will greatly increase egg production during the winter months. And in many cases the profit on the additional eggs soon pays for the plant which supplies the light.

A Fuller & Johnson Power and Light Plant will supply bright, dependable light for your hen house, and will also give you the convenience and comfort of electric power and light in your home, yard, and barns, always ready at the touch of a button. The *safety* of this light is real property protection.

Fuller & Johnson Plants are of the modern, direct connected type, designed to give the battery a life-prolonging tapering charge. They are air cooled, operate economically on gasoline or kerosene, have pressure lubrication and close-regulating mechanical governor.

There is a size to fit your needs. A post card request will bring complete information.



What a User Says:

Gentlemen: We have used your No. 15 Power and Light plant for three years without one cent of repair expense. We use an electric light in the hen house and this has more than doubled egg production. The one best plant for the farmer is the Fuller & Johnson.
Gilbert Baker, Edmund, Wis.

FULLER & JOHNSON
POWER & LIGHT

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, J. O. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

BOLENS Garden Tractor

Does Seeding, Cultivating and Lawn Mowing with great saving of time and effort. All it needs is a guiding hand. Gasoline power does the

work. Attachments for different jobs are instantly interchangeable. Many indispensable features, patented arched axle, tool control, power turn etc. A boy or girl will run it with delight. Write
GILSON MFG. CO., 994 PARK ST., PORT WASHINGTON, WIS.

Beekeeping

Study Local Conditions

PENNSYLVANIA has a very wide range of climate, soils and honey plants. These factors afford a large field of study and wise is the beekeeper who studies his local conditions, for he will succeed. Beekeepers everywhere have the same problems in management but any given problem may vary greatly as to time and intensity. All beekeeping work should point toward a coming honey flow and timed accordingly.

An example of this is found in the time of the clover honey flow which comes about one month earlier in the region of Philadelphia than it does in many northern counties. It would be utter foolishness for beekeepers in Tioga County to put on supers for the clover flow at the same time that the supers are put on near Philadelphia for the honey flow from the same plant.

Influential Factors

In addition to the fact that climate, soils and the kind of honey plants, influence beekeeping practice, weather conditions vary greatly so that there can be no rule-of-thumb schedule laid down as to the exact time to do any particular thing. The beekeeper must know his local conditions and use good judgment in applying instructions, otherwise he may manipulate his colonies too early or too late and lose out by so doing. Examples of this are sometimes found where beekeepers have unpacked their bees too early in the spring and exposed the colonies to subsequent freezing weather, or put off supering the bees until the honey flow was partly over and lost part of the honey crop, or packed the bees too late in the fall, etc.

Our task is to teach the beekeeper rather than to teach beekeeping. If we can so advise timely operations so that the beekeeper no matter where he lives, can apply the instructions and succeed we will feel amply repaid for the effort.—George H. Rea.

Have Enough Equipment

THE average beekeeper loses money not so much on what he invests in the business, as in what he fails to invest. In other words it pays well to invest in sufficient equipment so that the largest honey crop may be harvested and none of it lost. Better have a hive ready and not needed than to have no hive ready and a fine swarm go to the woods. Better have a few supers or a few sections or a few pounds of foundation left over than to be short of these things when a good honey flow is on.

Many a good honey flow has passed within a few days of heavy bloom and good weather while the beekeeper was fussing and fuming getting equipment ready that should have been all ready for the bees weeks ahead of time. In the winter, while the bees are resting, is the time to put up new equipment and to renovate used supers and hives and get everything ready for the honey harvest. What a satisfaction it is to be all ready when the busy time comes, to say nothing about the extra pounds of honey added to the larder because plenty of room is given at the right time.

Now is the time to mend the smoker, bee veils, gloves, and machinery or replace with new ones. A good smoker and plenty of fuel that will give volumes of cool smoke when needed is a necessity in modern beekeeping. In fact, the smoker is the beekeeper's most necessary tool. The veteran may dispense with gloves and veil but beginners should have them handy at least.—G. H. R.

More net Profit *from the same farm!*

YOU can keep down expenses, taxes, and hired labor, and greatly increase your profits through better farming methods instead of cultivating more land. Diversified farming distributes your work, makes marketing easier, increases profits, and maintains the fertility of the soil.

Hinge-Joint Columbia Super Zinc-ed Fence REG. TRADE MARK

is the first requirement for modern, diversified farming. It makes and *keeps* your fields hog-tight so you can rotate crops and pasture fields most profitably. The Columbia Hinge-Joint construction and full gauge wires afford the most satisfactory type of fence for severe service on the farm.

Super-Zinced Fences are guaranteed unexcelled in quality and durability. They are armored against rust by an extra heavy coating of zinc, so closely bonded to the steel that it will not crack or peel. It will pay you to insist upon our brands of fences, barbed wire, gates, steel posts, and wire nails. Write for free farm account book and fence catalogue. Use the coupon or a postal card.

E-B Disc Harrow

A Quality Implement Through and Through

The two essentials that you must have in a horse-drawn harrow—*flexibility* and *uniform penetration*—are amply taken care of in this E-B machine. It cuts into the low places as evenly as on the level stretches. And it can be relied upon always for first class work!

It is a thoroughly well-built harrow with several superior features. The large chilled spools turn in close-fitting, oiled, hard maple bearings that are practically dust-proof. Its scrapers swing free and may be locked away from the discs if desired. Bearings loosened at the factory and disc edges protected in shipping. Tandem attachments with levers adjustable from the seat supplied for all sizes.

Before you invest in any harrow this spring, inspect this E-B *Quality* Implement. There is an E-B dealer near you.

Ready Money

at a time it will be needed - - - -

REAL SERVICE—immediately following a fatal accident, **ready money** to care for the unexpected expenses is a welcome relief to those upon whom the responsibility falls. If you should be the next, will your family be protected?

For Readers of PENNSYLVANIA FARMER

EVEN if you are careful—and most of us are—you must trust your safety to others—Auto Drivers—Engineers—even Providence. Just a moment's neglect by them and you may be the victim of a serious or fatal accident. A defective steering gear, a tire blown out, an unexpected rut or stone in the road or a sudden bolt of lightning may have disastrous results.

You cannot afford to trust to *luck* when only $1.00 yearly will protect you and your family from immediate inconvenience or want through a serious or fatal accident that may happen to you any day.

To have this needed protection immediately, fill in and return the application today. No medical examination is required.

This Travel-Accident Insurance policy, available to every reader of PENNSYLVANIA FARMER, will pay—

$5,000.00 for loss of life by wrecking of railroad passenger car, street, elevated or subway cars as specified in policy—

$2,000.00 for loss of life by wrecking of horse drawn or private motor driven vehicle, bus, taxicab or passenger elevator as specified in policy—

$1,000.00 for loss of life by being struck or knocked down while on a public highway or being struck by lightning, cyclones, tornado, as specified in policy—

$10.00 weekly for 15 weeks for all injuries sustained in the above manners as specified in policy.

PENNSYLVANIA FARMER is not in the insurance business but in line with its many years of service, PENNSYLVANIA FARMER has arranged for its readers the best and the greatest protection that can be given for the low cost—and it is available to every member of a reader's family. You owe it to yourself—you owe it to your family. The small cost of $1.00 a year places this protection within the reach of everyone. Send your application now.

$5,000.00 Travel Accident INSURANCE

for only **$1** *a year*

Any representative of PENNSYLVANIA FARMER will be glad to explain this policy to you. Applications must be made on the blank provided.

Notice: Not more than one policy can be issued to any one person, but any and all members of a reader's family may each secure one.

Application

Print each name and address clearly and carefully. Illegible names will delay the delivery of your policy.

RADIO DEPARTMENT

Conducted by

BRAINARD FOOTE

How to Locate Trouble in the Radio Receiver

JUST as automobiles do not always operate flawlessly, even when fairly new, but develop misses, knocks and leaks, so do our radio receivers frequently give us trouble. And the radio machine is much more delicate than the car, for with only a single loose connection or bad contact in a tube socket reception may cease completely.

Anything that prevents the clear reception of the chosen program is an obstacle that should be removed if possible. Such interfering conditions may arise in two places:

1. From outside the set—external.
2. From within the set—internal.

To discover to which one of these two classes any particular difficulty belongs, it is merely necessary to disconnect the aerial from the set. Should the interfering noise stop along with the music, it is an external trouble. If the noise continues without noticeable change, it is internal and the trouble is in the set.

Static is the main outside cause of interference in most cases. Nothing of account can be done by the listener to prevent it, altho for local work static may be lessened by employing a lower aerial, or even an indoor aerial. Electrical interference is next in order. This is often manifested by rumbling or buzzing noises when an electric motor is going nearby or a train or trolley passes. To decrease interference from this source, erect the aerial as far from, and at right angles to any nearby power lines or traction lines.

Cause of Clicking Sounds

Clicking sounds, which may stop the signals completely or weaken them are caused by loose joints in the aerial system, by the wire touching some object, or by other wires or aerials very close at hand which have loose contacts.

Household appliances often cause annoyance. Electric heating pads with automatic contacts, vacuum cleaners, etc., that must be used constantly, create clicks and humming sounds. These can be stopped by connecting the one or two mfd. condenser across the input power wires. Have an electrician do this for you, making sure he selects a condenser that will stand the voltage of the line.

The only difficulties that the non-technical man can treat adequately are those arising from loose contacts and old batteries. Crackling, spitting, sizzling and frying sounds generally are due to either of these sources. Wiggle the tubes in their sockets. If crackling noises result, remove them and sandpaper the contact prongs. Also sandpaper the contact parts inside the socket by wrapping sandpaper about a non-metallic rod or stick. Look for loose wires on the set binding posts or batteries. Replace old B batteries with new ones, as old B batteries cause noises because of chemical decomposition going on in them.

On the storage battery, the positive terminal collects green corrosion matter, which should be cleaned off frequently. Clean the connecting wire with a knife or sandpaper. Dry cells so old that the rheostat has to be turned on full head should be replaced with new, and quieter reception will follow.

Troubles other than these are subjects for repair by a radio expert. There is, however, another important group of radio annoyances which the novice should know something about. Squeals, whistles, howls, etc., are included. The microphonic howl is caused by air vibration between the glass wall of the tube and the loud speaker. Usually, the detector is defective in that its elements have been loosened by careless handling. The noise resulting begins faintly, gradually increasing in volume. It can be stopped by grasping the detector tube, placing the hand over the loud speaker, closing the cabinet lid tightly, etc. Interchanging tubes usually stops this noise.

Whistles that are not heard when the aerial is disconnected, may arise from three sources:

1. Improper tuning or defect in one's set.
2. Interference between two stations of nearly the same wave length.
3. Radiation from some nearby receiving set.

When and Why the Whistles

In the first case, the whistle is heard as one tunes the set. It is caused by a defect in the set's construction, by using too high a B battery voltage, or advancing the tickler (or regeneration) dial too far. Remember any such whistle may be radiated from your aerial to bother other listeners. In the second instance, the trouble cannot be overcome and is caused by a multiplicity of broadcasters with wave lengths too crowded together, combined with the use of a sensitive receiving set.

In the third case, the whistle comes and goes without your touching the dials. It comes from some one else's set, which oscilates or whistles as it is tuned. The only remedy possible is to trace the offending party thru inspecting the sets used with the neighboring aerials and endeavoring to persuade the owner that he should not permit his set to squeal so much. The whistle caused by two conflicting stations may be recognized easily since it is a steady drone or whining whistle whose pitch may vary slightly as you allow your set to remain tuned to it, but whose pitch or tone you cannot alter by moving the dials.—B. F.

Directions for Soldering

CLEAN thoroly the wires or parts to be joined by scraping or sandpapering until they are shiny all over. Twist wires together so that strain will not come upon the solder. Apply just a speck of soldering flux.

Next have a good hot iron, thoroly tinned. It is impossible to solder with either a cool iron or a dirty one. To tin it, after it is heated, file it on all sides, applying some rosin-core solder or plain solder and flux and file the solder down until the entire tip is shiny.

Then hold the iron on the joint, with a little extra solder to help conduct the heat to the wires. The actual solder should not be melted by the iron but by the wires themselves, heated by the iron to the point at which they will melt solder. When it flows smoothly, take the iron away and do not touch the joint until cool.

A good joint is dull and smooth—not shiny and full of little points of solder sticking up. Be careful not to use too much flux, as any flux causes some corrosion in time, unless thoroly burned away at the time of soldering. Never allow an iron to get red-hot, as you'll have to tin it all over again.—B. F.

"Increase The Live Weight, Reduce the Death Rate" That correct feeding is the big factor in keeping chicks healthy was proven on the NOWAK EXPERIMENTAL FARMS last Spring. Ten lots of day old chicks were purchased, 500 in each lot, 5,000 in all. They were ordinary chicks and were kept under ordinary conditions, but fed DOMINO CHICK FEEDS, and an almost unbelievable record was made for NOT A SINGLE CHICK DIED OF WHITE DIARRHOEA, that deadly scourge, and ever present menace to young fowls. Save your chicks. Grow them to healthy maturity, strong sturdy cockerels, and early laying hens. Play safe, feed DOMINO.

Three Days to Six Weeks FEED— DOMINO CHICK STARTER with Buttermilk DOMINO CHICK FEED

Six Weeks to 5 or 6 months FEED— DOMINO DEVELOPING FEED DOMINO GROWING MASH

DOMINO CHICK STARTER · DOMINO CHICK FEED · DOMINO DEVELOPING FEED · DOMINO GROWING MASH

Clean, dry, properly ventilated quarters are important, but subordinate to the importance of correct feeding. Improper feed causes weak puny chicks that succumb to disease even though the housing and care given them is perfect. If they live they grow slowly, developing into light unprofitable cockerels, and late irregular layers.

FEED DOMINO CHICK FEEDS, build strong hardy chicks that will stand exposure. It is difficult to achieve perfect care and housing, but DOMINO FED CHICKS thrive anyhow. Right through the dangerous period, 3 days to 5 or 6 months, DOMINO CHICK FEEDS carry the chick, for they contain all the minerals, proteins and other ingredients essential to quick, hardy, healthy growth.

DOMINO CHICK FEEDS simplify chick feeding, reduce its complications, eliminate disease, do away with its uncertainties. They make big profits sure. See our Local dealer.

"Say It With Feed"

Big profits depend on the feed you use. Really you can—"Say It With Feed." Just send for booklet. "Increase The Live Weight, Reduce The Death Rate." Teaching the Public to Use High-Grade Fertilizer

What progress is being made in the use of concentrated fertilizers?

IN RECENT years there has been a well-organized effort on the part of our experiment stations as well as on the part of manufacturers of commercial fertilizers, to discourage the use of low-grade fertilizers. By "low-grade" fertilizers is meant material that contains a rather small number of units of plant food per ton. The quality of the plant food also enters into the definition of low or high-grade fertilizer, for a product may contain a relatively high proportion of plant food of low availability and, therefore, be a low-grade rather than a high-grade fertilizer.

What It Should Contain

A concentrated fertilizer should contain a relatively large number of actual units of plant food of ready availability. The definitions are more or less arbitrary. Several years ago the Soil Improvement Committee of the National Fertilizer Association suggested that mixtures containing less than fourteen units of plant food be regarded as low-grade fertilizers. Since that time there has been very considerable progress made in educating both the manufacturer and the farmer in the advantages that lie in the production and use of more concentrate mixtures.

Certain arguments are presented to justify the use of the more concentrated materials. From the manufacturer's point of view, the concentrated product offers economies in the handling of raw materials, mixing, bagging and selling. From the farmer's point of view, the more concentrated fertilizers are desirable because they are made up of higher grade materials and are also more economical to handle and distribute. On the other hand, it is claimed that more concentrated fertilizers, made up of soluble chemicals largely, must be distributed with greater care, for the danger of burning a crop would be increased.

Most of our leading manufacturers of fertilizers have experimented with concentrated mixtures. Starting in a small way, they have gradually increased the tonnage of these mixtures, and report that the users have been satisfied and have been ordering larger quantities from year to year. In a letter recently received by the writer from one of the leading manufacturers of commercial fertilizers the following statement occurs:

One Company's Experience

"Last year was our first time to place concentrated mixed goods on the market. While we sold relatively a small quantity, this was widely distributed, being used on quite a variety of crops, extending from New York to Louisiana. Owing to the extremely dry season in some portions of our territory, viz: the Piedmont, and part of Virginia and Pennsylvania, it was not a good year for a fertilizer test of any kind. However, we have received a large number of testimonials from different parts of the country, the writers stating that they had excellent returns from our super grade, 6-18-6. Most of these men appreciate the advantages accruing from a saving in freight, hauling and handling, to say nothing of the benefits to the crop."

The material in question was used on cotton, tobacco, tomatoes, beets, corn, oats and other miscellaneous crops. It is interesting to note in this connection that the introduction of such concentrated mixtures creates new problems, both in the manufacture and in selling.

The same writer states:

"It will take some time, in my opinion, before concentrated fertilizers are generally used, as the farmer looks at the initial cost per ton, rather than the cost of the individual unit of plant food, and it will be a matter of education along this line before consumption is enlarged very greatly. On the other hand, the larger fertilizer companies realize that a rapid change to concentrated goods cannot take place on account of their existing manufacturing facilities and organization.

"There is another element also, viz: the compensation of the dealer who is accustomed to receiving so much per ton. In other words, his compensation is based on tons rather than percentage of the value of a ton, or the number of units of plant food. Therefore, you can see that in selling more concentrated goods some adjustment will have to be made. . .

"So far as injury to the plants is concerned, we have had but one complaint from the many customers who used our goods last year. In fact, where concentrated fertilizers are used with any intelligence at all, there is no danger of burning the crop. In spite of the dry season we had the past year, no damage was noted to any of the crops by virtue of the fact that the goods were more concentrated than the ordinary goods. Some growers use as much as 800 pounds of concentrated fertilizer per acre which is equivalent to 1600 pounds of ordinary fertilizer."

Eliminate Lower Grade Products

Another writer notes that, by using such high-grade fertilizer, some of the materials contained in the lower grade products are eliminated. For instance, ordinary sixteen per cent acid phosphate contains a large proportion of gypsum. This often has pronounced value for crop production. In the same way, kainit and manure salts contain magnesia, which may also be of value under some conditions, whereas high grade muriate and sulphate of potash contain practically no magnesia.

It was also noted by him that the exclusive use of concentrated fertilizers would compel the abandoning of the utilization of the lower grade products, and low grade by-products which, because of their use, tend to keep down the cost of fertilizer materials. He also points out that "the high grade fertilizers would be so concentrated that until the farmers learned to handle them I am afraid they would injure germination of the seed by putting the seed in contact with these very concentrated, soluble materials. Our attitude is to wait for some results from the experiment stations concerning the use of these high grade materials before going into them to any extent."

The president of a third fertilizer company has some very interesting comments to make on the subject. He says:

Good Materials Essential

"About three years ago we put out in the South a new brand analyzing twelve per cent available phosphoric acid, four per cent ammonia and four per cent potash, which was a decided advance in concentration over the brands used in that section for the growing of cotton. The first year we put out in this particular section about 5000 tons, and as the brand did its own selling the demand the next year was in excess of 40,000 tons. It is now a standard brand made by all of our competitors. Good materials must be used to make it.

"Last year we put out two more highly concentrated brands. One analyzed fifteen per cent available phosphoric acid, five per cent ammonia, and five per cent potash, and we sold a much larger tonnage in the several states where we offered it than we expected. The other brand analyzed 4-16-4, double the old 2-8-2. It also was offered in sections where 2-8-2 in times past had been a favorite. . . .

"These grades are as concentrated as can be made with present available materials and with present plant equipment, and we feel that they are as concentrated as we should go for the time being, taking into consideration present practice and present distributing machinery. The controlling reason for making them is that we can deliver on the farm the very highest grade of plant food at a less cost per unit to the farmer. So far it has not resulted in any decreased application, and inasmuch as we have to nearly reached the saturation point in fertilizer use we feel that it will not result in a decrease in tonnage, but will result in the farmer getting more plant food under his crops."

The above quotations will indicate that our leading fertilizer manufacturers are convinced that it is best, both for the industry and for the farmers, to use more concentrated and more readily soluble chemicals. The tendency in this direction is certain to become more pronounced, and every progressive farmer should, therefore, keep in touch with the developments in the fertilizer industry and with the experiments carried on at the experiment stations.—J. G. Lipman.

Which Shall I Use?

I can buy burnt lime at twenty cents per bushel or the same lime ground at $6.00 per ton. Have eleven miles to haul or I can buy burnt lime at $6.00 per ton stone and can obtain the same lime at $8.00 per ton, eight miles to haul. This ground lime is fresh burnt, not slaked any before being ground, and can be sown with a grain drill at most any rate per acre. Some sow as low as 700 to 800 pounds. Which is the most economical to use, stone lime slaked, spread and harrowed in, or ground and drilled in? There is a big difference of opinion among the farmers here, some say ground lime is worth two to one sown with a grain drill two weeks before planting crop. Others say stone lime is cheapest. Does the gas that rises on lime that slakes in the ground have any effect on the ground or does it kill the acid in the ground more than slaked, according to cost, not quantity labor and hauling? The trouble here seems that the lime kilns cannot supply the people.—W. W., Bedford County, Pa.

Freshly burned lime varies in weight per bushel in accordance with the kind of limestone used for burning and the thoroness with which it is burned. It is assumed that, on the average, a ton of freshly burned lime will contain twenty-five bushels. At twenty cents a bushel, a ton of freshly burned lime would, therefore, cost you $5.00. If you could get the same lime ground at $6.00 per ton, it probably would be more satisfactory for you to use than the burned lime, which you would have to unload, slake, load again and distribute.

A Few Considerations

With the other kind of lime which you say can be bought in a freshly burned state at $6.00 per ton on the one hand, or the same material finely ground at $8.00 per ton on the other hand, there would be a difference of $2.00 per ton. Considering the cost of hauling and the extra handling, you should be able to calculate whether it would be preferable for you to buy the ground rather than the lump lime.

As to the effect of the burned ground lime and of the burned and slaked lime, the chemical change which burned lime undergoes in the soil improves the texture more thoroly than does the slaked lime. Distributed at the rate of 700 to 800 pounds per acre with a grain drill, it should produce good results where the ground is not too sour. If no lime has been used on any particular field for a number of years, a larger application would be more effective.—J. G. Lipman.

In the Penna. Grape Belt

(Continued from page 3)

was valued at $20,000, the members raising this amount of money by buying three-year certificates of indebtedness.

Altho no one is ever asked to join the association, the membership has grown steadily until it now includes about 325 growers owning over 5500 acres of grapes. This represents more than sixty per cent of the grape production of Erie County. Any qualified grower who is willing to sign the contract and live up to the regulations may become a member, but new members are not solicited.

When a grower joins the organization he pays a five-dollar membership fee. Then he delivers to the association a negotiable promisory note for the sum of twenty-five dollars, plus ten dollars for each acre of crops he is to market thru the association.

These notes may be used for security when the organization needs to borrow money for the conduct of the business, or they may be used to pay for any damage that may be done by the failure of members to live up to their contracts.

The association handles grapes, cherries, prunes, peaches and raspberries, the grapes being the most important crop by far. It also acts as a buying agent for nearly every item the growers use in running their business,—fertilizer, limestone, all kinds of spray material, wire, staples, posts, etc., etc. It handles as many as thirty carloads of grape vine stakes a year.

The grapes are sold thru a daily pool. A retention fee of $3.00 a ton is allowed to cover selling costs; it is out of this $3.00 commission that the manager has saved most of the $49,500 mentioned at the beginning of this article. As this fund of accumulated savings becomes larger than is needed part of it is paid back to the growers as dividends. In 1922 and 1923 more than $24,000 in cash was returned to the growers in dividends. It is the plan to hold back two years' dividends; thus 1924 patronage dividends will be paid in 1926 and 1925 dividends in 1927. The surplus savings for 1924 and 1925 amount to approximately $25,000.

Not one member has left the association during the last three years on account of dissatisfaction. The only withdrawals have been the few who discontinued farming and were therefore automatically released from membership.

Why It Is Successful

If you ask the officers of the Keystone Cooperative Grape Association why their organization has been so successful they will tell you it is largely because of the loyalty of the members. And if you ask the members why they think their cooperative has "made a go of it" when so many others have failed, they will tell you it is because they have such a good manager and so wise a set of officers.

Both answers are right, but to the outsider it looks as tho the members wouldn't be so loyal, the trade so friendly, nor the accumulated working fund so large if it were not for the well-directed hard work of a manager and set of officers who know how the business should be run.

LIVESTOCK

Review of local market for week ending February 13, 1926: Market draggy. Receipts mostly cows and plain killers. Comparisons with week ago: Beef steers steady, few choice offerings; top, $9.90; average weight, 1025 lbs, some held higher; bulk of sales, $8.50@9.25. Bulls and heifers slow, about steady. Cows fairly active, steady; bulk, $4@5.25. Stockers and feeders inactive. Calves weak, better grades 50c lower; top vealers, $16. Hogs, steady; fair demand; top westerns, $15.

Receipts for Saturday's market: Cattle, 6 cars; 3 from Chicago, 1 Iowa, 1 Virginia, 1 St Paul, containing 147 head, 36 head trucked in. Total cattle, 183 head, 389 hogs, 10 calves. Receipts for week ending February 13, 1926: Cattle, 41 cars; 16 Penna, 10 Chicago, 5 Virginia, 3 Iowa, 2 St Paul, 2 Buffalo, 1 Mississippi, 1 West Virginia, 1 Indiana, containing 1037 head, 245 head trucked in from nearby. Total cattle, 1282 head, 28 calves, 872 hogs, 126 sheep. Compared with week previous: Cattle, 46 cars containing 1152 head, 385 head trucked in. Total cattle 1537 head, 82 calves, 1415 hogs, 130 sheep.

Hogs—Receipts, 500; market steady. Bulk of sales, $14.50@14.75; top, $15. Medium weight, 200@250 lbs, medium, good and choice, $14@14.50; light weight, 160@200 lbs, common, medium, good and choice, $14.50@15; light lights, 130@160 lbs, common, medium, good and choice, $14.25@15.

Cattle—Receipts, 475; calves, 10. Market steady. Beef steers, firm; quality mostly medium, top, $9.75; bulk, $8.50@9.25. Bulls, she stock and canners slow, about steady. Calves steady, top vealers, $16.

Steers—1100@1500 lbs, good, $9.25@10.25; medium, $8@9.25; common, $6.50@8. Steers, 1100 lbs down, good, $9@10.25; medium, $7.75@9; common, $6.25@7.75.

Heifers—Good and choice, 850 lbs up, $8@9; common and medium, all weights, $4.50@8.

Cows—Good and choice, $6@7.25; common and medium, $3.75@6; canner and cutter, $2.25@3.75.

Bulls—Good and choice, beef, 1500 lbs down (yrl. exc.), $6.50@7.50; canner to medium, canner and bologna, $1.50@6.50.

Vealers—Medium to choice, $14.50@16; cull and common, $5@14.

Steers—(850 lbs up), good and choice, $8.50@9; common and medium, $5@8.50. Steers, 800 lbs down, good and choice, $8 @8.75; common and medium, $4.50@8.

BALTIMORE PRODUCE

Butter—Creamery, fancy, 46c; do, choice, 44@45c; do, good, 42@43c; do, prints, 46@48c; do, blocks, 45@47c; do, ladles, 34@36c; Md and Penna, rolls, 32@35c; Ohio and West Virginia rolls, 32@35c; store packed, 32c; Md, Virginia and Penna, dairy prints, 32@35c; process butter, 40@41c.

Eggs—Market unsettled. Nearby fresh-gathered firsts, offered 32½@33c, bid 32c; no sales; western fresh-gathered firsts, offered 32½c; no bids.

Live Poultry—Chickens, old hens, 4½ lbs and over, 32@33c; 3½@4 lbs, 30@31c; Leghorns and other light fowl, 28@30c. Young chickens, large size, fat, 35@36c; 2 lbs and under, fat, 40c; Leghorns and other light stock, 32@33c; all kinds, poor and thin, 24@25c; old roosters, 18@20c. Ducks, White Pekins, 32@35c; Muscovy, young, 31@32c; puddle, 31@32c. Geese, nearby, 24@25c; Kent Island, 24@26c; western and southern, 18@22c. Turkeys, young, 9 lbs and over, 50@52c; old toms, 40@42c. Guineas, young, 75@85c; old, 35@50c. Pigeons, young and old, pair, 25 @30c.

YORK PRODUCE

Butter—Country, 55@60c; separator, 60c lb.

Poultry—Hens, 24@28c; dressed, 75c@$2.50 ea.

Eggs—30@40c dozen.

Vegetables—Potatoes, 15@50c ½ pk, $2 @3.50 bu; cabbge, 3@25c hd; lettuce, 15@25c hd; celery, 3@20c stalk; carrots, 3@5c bch; horseradish, 5@10c glass; onions, 12@18c box; beets, 1@5c ea, 10c box; soup beans, 15c pt; lima beans, 35c qt; peppers, stuffed, 5c ea; spinach, 18@20c ¼ pk; turnips, 8@10c box, 12@15c ¼ pk.

Fruits—Apples, 10@25c ¼ pk, $1@2.50 bu.

Retail Grain Market—Wheat, $2; corn, $1; oats, 65c; rye, $1.15; bran, $2.10 cwt; middlings, $2.25 cwt.

Wholesale Grain Market—Wheat, $1.85; corn, 80c; oats, 55c; rye, 95c; bran, $40 ton; middlings, $42 ton.

Toledo, Ohio, February 13, 1926.

Cloverseed, cash, domestic, $20; cash, imported and February, $15.20; March, $15.25 asked; October, $15.75 asked. Alsike, cash, $16.60; March, $16.75. Timothy-seed, cash and February, $3.55; March, $3.57½.

FEED PRICES

The prices below are for prompt shipments based on payment on arrival of cars as quoted by the Philadelphia jobbing trade to retail feed dealers on Monday, February 15. Quotations cover solid carlots for delivery at Philadelphia or Scranton rate points.

Pure spring bran	$33.50@34.00
Spring bran	33.00@33.50
Soft winter wheat bran	34.50@35.00
Hard winter wheat bran	33.50@34.00
Standard middlings	33.50
Soft winter wheat middlings	33.50@39.00
Flour middlings	35.00@39.50
Red dog flour	41.00@44.00
White hominy	33.00
Yellow hominy	33.50
Gluten feed	43.00@44.00
36 per cent cottonseed meal	37.50@38.00
41 per cent cottonseed meal	40.00
43 per cent cottonseed meal	41.00@42.25
34 per cent linseed meal	51.20@51.75

Millfeed in ample supply, with market easy.

For Baltimore, Cumberland and Williamsport rate points, subtract 20c per ton (for cottonseed meal 40c per ton); for New York, Newark rate points, add 40c per ton (for cottonseed meal 60c per ton); for Woodbury, Bridgeton rate points, add $1.00 per ton; for Freehold, Toms River, Cape May rate points, add $1.40 per ton.

The Trend of the Markets

THE figures in the following table represent the approximate unweighted average prices of the commodities and grades specified. The prices are based upon quotations from the market page of Pennsylvania Farmer.

	This week	Last week	Month ago	Year ago
Butter, 92 score creamery extras (N. Y.)	$ .43	$ .46	$ .43	$ .40½
Eggs, fresh gathered extra firsts (N. Y.)	.36	.34	.38	.47
Chickens, live, by express (New York)	.36½	.36½	.30½	.30
Potatoes, 150-lb sacks (Philadelphia)	6.82½	6.92½	6.95	1.55
Steers, good to choice (Lancaster)	9.75	9.75	10.00	9.25
Hay, Number 2 timothy, baled (Phila.)	24.50	24.50	24.50	20.50
Wheat, No. 2 red winter (Philadelphia)	1.76¼	1.88	1.79½	1.95½
Corn, No. 2 yellow (Philadelphia)	.78	.79	.82¾	1.41
Oats, Number 2 white (Philadelphia)	.50¾	.52	.52¼	.66½

County News and Comment

Carbon County, Pa.—On February 3 a severe snowstorm covered Carbon County with fourteen inches of snow which piled into drifts. Truck and auto traffic was suspended while men with horses, bob sleds and snow plows opened the highways. No pressing work at present. Some farmers drawing manure, others laying in their summer supply of wood and doing general repair work about their machinery. Stock wintering well, rye and wheat had a light covering of snow the greater part of the winter. Quite a number of farmers took advantage of the farmers' short course meetings which were arranged for by the county agent. Butter 50c; eggs, 46c; potatoes, $2.50 bu. at car, retail to consumers, $3. Hogs, dressed, 17c; lard, 21c; apples, $2.—L. E. B., Feb. 9.

Centre County, Pa.—A blizzard began last Thursday January 28 with a very high wind. By Friday morning mercury was down to twenty-five degrees below zero in different parts of the county. Today Mother Earth is resting under twenty inches of snow on the level and there has not been a breath of wind to drift it. The trees were never more beautiful than they are this morning. A good many beeves are being killed which sell for 13@15c by the quarter; lambs, 12c, live weight; butter, 45c; eggs, 40c; lard, 20c; wheat, $1.75; rye, 90c; corn, 75c; barley, 80c; oats, 35c; buckwheat, 80c; dressed hogs, 17c.—A., Feb. 6.

Chester County, Pa.—February has been up to her old tricks again and piled the highways and by-ways full of snow. Nearly half of the roads were made impassable by the recent storms. The Grange meetings over the county have been the principal ones held this winter, except in the southern end of the county were the area testing for T. B. has stirred up the people and meetings on both sides have been held. But since the testing has actually started and the farmers realize it is not compulsory the feeling against the test is subsiding. So far the reactors are about fifty per cent of the number tested. Potatoes are still very much in demand at $3 bu. Apples are moving a little better than earlier in the winter. Eggs are getting more plentiful and good fresh eggs are bringing around 50c. Very little rough feed is changing hands as most of the farmers are feeding it to their livestock. Mill feed a trifle higher. Farmers are busy during their spare time getting wood ready for present and future needs as coal is nearly out of reach in price as well as quantity.—F. H. G., Feb. 9.

Frederick County, Md.—This county has been in the grip of real winter weather for the last few weeks. About ten inches of snow fell on the third followed by hail and wind closing the roads in some places. The sudden freeze following the rain and thaw of two weeks ago threatened to do serious damage to the grain but it is hoped the recent snow will to some extent repair the damage. According to figures just released by the Bureau of the Census there are 3799 farms in this county at the present time while in 1920 there were 3817, or a decrease of eighteen farms. This is attributed in part to the tendency to consolidate farm lands and also to the cutting up of some near towns for building lots. However, Frederick County is still second on the list in number of farms in the various counties of Maryland, Baltimore County being first. Prices of pork are still high, around 16@18c lb.; cattle are good but dairy cattle scarce; butter around 45@50c; eggs, low, 30@32c on local markets; potatoes, $2.—R. J. W., Feb. 8.

Indiana County, Pa.—Area T. B. testing is almost completed in Indiana County now. Just one more township to be tested. A large amount of individual testing had been done previously and so the loss was comparatively low. The percentage of loss was 1.8. In some townships there were no reactors at all and in one which had the greatest loss there were sixty-four. This has been a fine winter for grain. A blanket of snow has been over the ground to protect it during each cold spell but snows have not tied up traffic to any extent. Good fat hogs are selling at $13.50 and hogs in general are very scarce. Cows are rather high due to T. B. testing. Milk is about $2.50 per hundred and retails at 12c in Indiana. Chickens are laying fairly well, eggs are 35c; chickens, 30c; wheat, $1.80; oats, 55c; hay, $18. Cooperative organizations seem to be running smoothly.—H. A. N., Feb. 8.

Juniata County, Pa.—On February 3 fourteen inches of snow fell which was the heaviest of the winter. The roads in the rural districts were blocked to motor traffic for several days. Very little farm work to be done at present, except cut wood, haul manure and attend to stock. County Agent D. R. Pheasant is holding community meetings for the purpose of discussing the agricultural extension work in the various townships. Poultry meetings also being held by a poultry extension specialist from State College for the purpose of discussing the hatching and rearing of chicks. Cloverseed scarce and many farmers will buy from seed houses. Incubators are being set for early chicks. While many farmers are installing electric light and heating plants and other conveniences, it seems that the appeal of the automobile is much greater than that of the modern home equipment. Wheat, $1.80; oats, 60c; corn, 75c; potatoes, $2.25; eggs, 29c; butter, 50c.—C. B. L., Feb. 8.

Passaic County, N. J.—The weather for the past month about average, the first part mild, the latter part, or the last two weeks, quite cold. On February 4 we had a severe snow storm, about twelve to thirteen inches fell. There was quite a strong wind with it but by the next night all state and country roads were opened so two machines could pass and now, even tho there is a lot of snow, the roads are in good condition. There is not much farm work going on just now. Pruning is well under way. Some of the frames are started in Richfield section. Hens are laying fairly well thruout the county but eggs are dropping a little. Early tomato seeds will be planted in about two weeks. —N. D., Feb. 9.

Potter County, Pa.—Following a January thaw and a week of spring-like weather we have good sleighing and more snow coming. Many roads badly drifted. Men having hauling to do are taking advantage of the snowfall and are drawing logs, lime and ice. The annual convention of the Dairymen's League was held in the court room January 29th. The day was a bitterly cold one but over a hundred were present. Directors were elected and several delegates and the county agent gave interesting talks. The Potter County Historical Society, an organization having for its object the preservation of records and relics of pioneer life in the county, also held a meeting to elect officers for the coming year. The Grange is very much alive and Potter County Pomona Grange No. 54, P. of H., will meet with Ulysses Grange, February 18 and 19th. A few more carloads of potatoes are being shipped. The latest price is $2.25; eggs, 30@35c; dairy butter, 45c; creamery butter, 55c.—M. C. S., Feb. 8.

Tioga County, Pa.—Weather during the past month has been very changeable. On January 28 the thermometer dropped to zero and the wind blew a gale, on the twenty-ninth it registered from ten to fifteen below, and on the thirtieth rose until the snow melted and water ran in the roads and ditches. There is some snow, mostly in the roads. The hill roads for several days have been impassable for cars. There is much sickness, especially pneumonia. Farmers have been carrying the doctors from place to place with their teams. A warm spell the middle of January interrupted ice gathering but the cold weather will make it possible to finish. An occasional remaining woodlot is being cut down and converted into lumber. Surplus hay being pressed and delivered to market. Hens are laying better and eggs have dropped to 30c. Dairy butter selling at 50c and there doesn't seem to be any surplus.—P. W. L., Feb. 8.

Prices and Prospects

LIGHTER offerings resulted in a firmer tone in the hay market during the week ending February 5th. Prices averaged steady and storms in some sections caused heavier feeding. The scarcity of good hay widened the outlet for the lower grades at some points but the chief demand was for the better grades. Timothy was steady to firm. Arrivals were lighter at Boston on account of the heavy snow storm. Snow hampered trucking at New York and the demand was moderate. Timothy showed a firm tendency in Pittsburgh and Cincinnati altho prices were practically unchanged.

The grain market was not very active during the week. European importers took less wheat than was expected, which had a depressing influence upon the domestic market. An increased movement of corn lowered prices somewhat.

Favorable weather and cheaper feeds have been the chief cause of the lower prices of eggs. Receipts of eggs in New York, Chicago, Boston and Philadelphia in January were nearly fifty per cent heavier than in the same month in 1926.

The New York egg market was irregular during the week ending February 10th. Nearby eggs advanced slightly on account of lighter receipts but the market was only fairly active. The heavy snow storm that occurred on February 10 had a strengthening influence on the market and prices advanced both in New York and Philadelphia. Egg receipts in Philadelphia totaled 40,463 cases, of which number Pennsylvania furnished 2207. Prices made daily declines of about a cent a day from February 5 but the market strengthened on Wednesday.

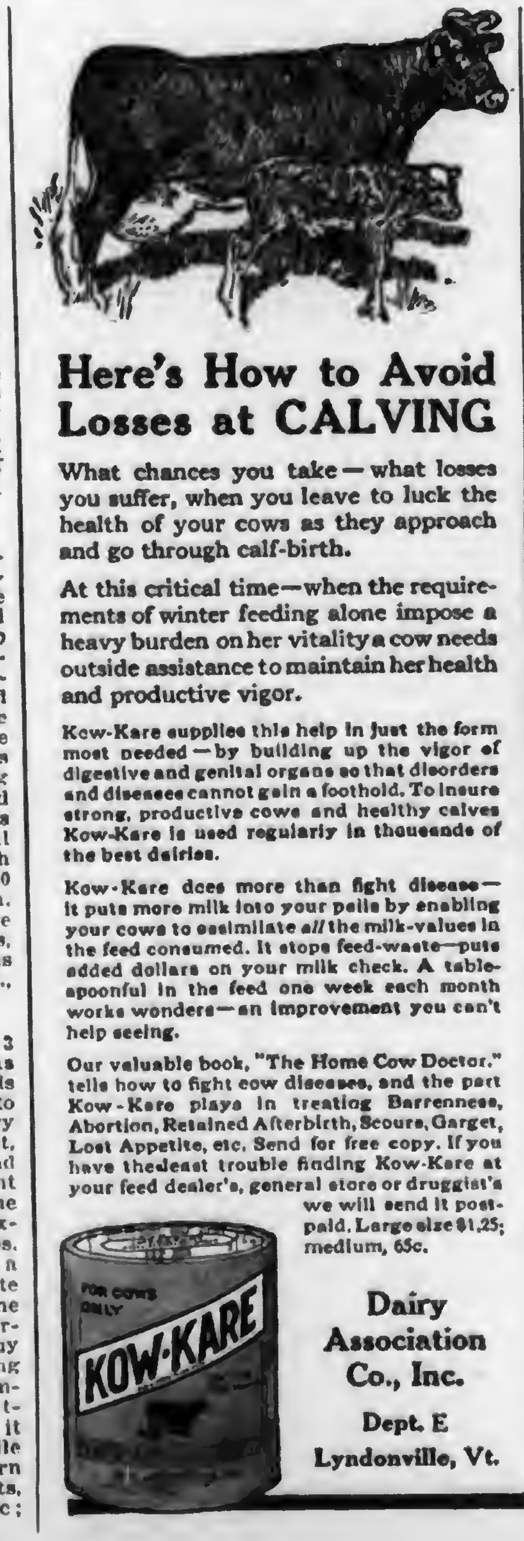
Live poultry was in fair demand in New York and express broilers held firm. The Philadelphia live poultry market was firmer with a fair demand toward the close of the week.

Pennsylvania and New Jersey fruits and vegetables are comparatively scarce on the Philadelphia market at this season of the year. Apples have been selling very slowly at steady prices but many dealers report that supplies on hand are cleaning up well and that fresh receipts are meeting a better demand.

The root crops such as carrots, turnips and parsnips are slow sale but fancy washed roots have a steady outlet at good prices. Colder weather and a limited supply have stimulated the demand for Pennsylvania celery and prices have made marked advances. The supply of mushrooms seems to be adequate for the demand and there have been no spectacular changes in the market for some time. Prices are holding steady with fancy stock bringing a premium.

Pennsylvania continues to supply the bulk of the potatoes on the Philadelphia market, altho Canada, Maine and New York have been furnishing considerable quantities. Trading was slow during the week February 3-10 but prices showed little variation. The tone of the market, however, was weaker. The heaviest snowfall of the season which occurred at the close of the week hampered trading to some extent.

In the early part of the week a similar storm hindered trading in New York and Boston. Business was at a standstill in Boston with most all trains and trucks tied up. A rather dull condition generally prevailed in all the eastern markets during the week.—W. R. Whitacre.



Here's How to Avoid Losses at CALVING

What chances you take—what losses you suffer, when you leave to luck the health of your cows as they approach and go through calf-birth.

At this critical time—when the requirements of winter feeding alone impose a heavy burden on her vitality a cow needs outside assistance to maintain her health and productive vigor.

Kow-Kare supplies this help in just the form most needed—by building up the vigor of digestive and genital organs so that disorders and diseases cannot gain a foothold. To insure strong, productive cows and healthy calves Kow-Kare is used regularly in thousands of the best dairies.

Kow-Kare does more than fight disease—it puts more milk into your pails by enabling your cows to assimilate *all* the milk-values in the feed consumed. It stops feed-waste—puts added dollars on your milk check. A tablespoonful in the feed one week each month works wonders—an improvement you can't help seeing.

Our valuable book, "The Home Cow Doctor," tells how to fight cow diseases, and the part Kow-Kare plays in treating Barrenness, Abortion, Retained Afterbirth, Scours, Garget, Lost Appetite, etc. Send for free copy. If you have the least trouble finding Kow-Kare at your feed dealer's, general store or druggist's we will send it postpaid. Large size $1.25; medium, 65c.

SOUTHERN Crops are Moving North at Fancy Prices

While you farmers of the cold sections of America are digging your way out to your snow-covered barns in order to feed and water your live stock; while you are suffering a forced idleness because of blizzard weather conditions, the farmers of the Southland are shipping their first crops and receiving in return therefor substantial prices.

All-year-'round growing conditions in the South; ideal living conditions; lower labor costs and splendid transportation service make possible the greater success of Southern farmers.

Write us today for full and free particulars about the success of other Northern farmers who have moved South, and information as to how we can help you. There is no charge for our service—now or ever.

LOUISVILLE & NASHVILLE R·R

The business of farming demands the best fence!

The days when exorbitant claims and unproven statements would sell fence are gone forever. Today the business of running your farm demands that you secure the utmost return from every dollar invested.

In Page Fence you will find a full measure of value—quality, durability and satisfaction; proven by over 43 years of constant use by farmers everywhere.

Constructed of wire manufactured by Page in the Page mills, this remarkable fence is heavily coated with galvanizing to assure against corrosion and rust. It is easily erected and will adapt itself to hills and hollows as well as even ground.

Good business judgment demands that you buy the best fence—ask your dealer to show you the various Page styles. You'll find he carries the pattern you need.

free

Write for interesting literature describing in detail the fence that has been first choice for three generations. No obligation.

The Voice of the People

This department is reserved for the use of our readers to discuss all problems and matters of general interest. Write your views and comments briefly on any question of social, economic or educational importance and thus share them with others. It will be necessary to limit such articles to 200 or 300 words. Publication of an article in this department does not signify editorial endorsement.

Don't Tamper with R. D.

WE THINK they had better leave well enough alone, about the R. F. D. It is better now than it ever was. In winter when snow is drifted they can not drive automobiles, and the routes are a good long trip for a horse. They have to have two, driving one one day, another the next, as it is too hard a trip for a horse to stand every day. And horses cost money, too. When it was let to the lowest bidder, they hired some poor man to draw the mail and cheated him out of his pay and he got nothing, after using his horse and wagon, buying horse feed and spending his time.

My husband's father and brother both got cheated, so we know whereof we speak. Probably the ones who are trying to stir this up are just wanting a chance to do the same.

R. F. D. carriers earn their pay in winter, driving twenty-five miles every day they can get thru in the cold. I have known of some who could not stand it and had to give it up.—Mrs. F. N., Wayne County, Pa.

The T. B. Question Again

Editors' Note:—The inference of the following letter evidently being that we have considered only one side of the tuberculosis eradication question, we are glad to print this letter in justice to the other side. The original penciled epistle is reproduced as accurately as possible. The first clipping mentioned is also printed. The second clipping is much too long for publication here. It tells of the heavy losses of some men (not named) who have had their herds tested, and quotes the editorial given below.

DEAR, SIRS:—In answer to your modest request. I must tell you in plain words if you still insist harping on the T. B. testing of dairy cows you will loose your subscribers that is all Farmers who have good sence. I for one would sooner you would stop the paper now than read it. You listen to a lot of Political workers and hoss Drs who make their liveing by loafing on the tax payers. We have good vetirinaren here who claim if you never had the T. B. in your heard have them tested and you will always have it and acording to all reports it must be so. Inclosed find clipping from the stockman and farmer and our Local News. if your people want any thing to clean up start at your dirty sess pool Phila not only the water but your dirty heathen people who choak poor Inocent girls to death and cut them up and throw them in the woods and then expect to get out on Pail. a lot of wicked bulls would not do such things you have enough to do if you would look after your busness and let the Farmers run their own busness you are full of the cow testing busness to to find jobs for a lot of young Loafers from the state Colledge to test milk it is not loafers the farmers wants it is workers it seems all the gang wants now is lots of money in apopriations to put lazy loafers on a job catching beetles testing cows or corn porers they had better take the money fooled away and buy coal for the poor people who are dying every day for want of fuel to keep warm if you want the truth give this room in your paper. Yours Truely, Chester County Farmer.

Following is one of the clippings enclosed with the above letter:

ANOTHER WARNING

We wish again to warn those who are in a hurry to clear the country of bovine tuberculosis that it is better to be careful than to be speedy in this work. Last week we heard, as we have heard on a previous occasion, that a considerable percentage of tubercular animals had been found in a shipment from a county supposed to be free of disease. The other day, in looking over the killing sheets of a carload of reactors, we noted half a dozen cases in which no lesions had been found. Such things as these are rather exceptional than usual and we note them as exceptional. But if they occur frequently they will in the end discredit the policy now generally accepted as correct. Careful work alone can prevent a reaction in the present movement to eradicate tuberculosis.

Suggested to Broadcasters

DEAR SIR: I have been interested in radio experimentally for twenty years and have had many experiences. Also have had splendid opportunity to study the question of the farmer and radio, especially in Chester County. In the days of the telegraph I often furnished time and weather for the community and enabled some to save their crops.

Radio has meant banishment of isolation and today because reception is better in country than in the city, the farmer often knows of happenings hours before his city cousin, and the newspapers furnish details or less important items.

Don't Know Best Ways Yet

However, the broadcasters are not yet cognizant of best ways to get to the farmer. He does not want (and seldom does) leave a field to run into the house at 10.30 A. M. say, to get weather reports. He does like to get time at noon and would like his weather report then. Also he does not have a one-wave length set so would like some way by which he can tune his set to the report before it is half over. The newsy portion often is over before a set not ready can tune in, and the listener is merely provoked. Again, market reports, baseball scores, weather, etc., are frequently given too rapidly for anyone but a stenographer to copy.

Also it is annoying to hear a program stretched out number after number with no chance to identify its origin. For here, Florida often comes as loud as Philadelphia and intensity is no guide. In fact, DX is often louder than nearby.

Radio is a boon to the country folks.—L. M., Chester County, Pa.

A young doctor was summoned as a witness in a case that depended on technical evidence. The opposing counsel was inclined to be sarcastic at the idea of so young a doctor being called.

"You are familiar," he said, "with the symptoms of concussion of the brain?"

"Yes," said the doctor.

"Then, if Mr. Smith and myself collided, and banged our heads together, should we get concussion of the brain?"

"Mr. Smith might," said the doctor.—Med. Standard.

Don't worry when you stumble. Remember a worm is about the only thing that can't fall down.

Veterinary

Conducted by Dr. J. F. Shigley

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We invite readers to make use of this service. Clippings from the column when properly preserved and classified, make one of the most valuable medical symposiums a farmer-stockman can obtain.

SCRATCHES.—Will you please advise me what to do for a horse that has the scratches or mud fever? J. G. D., Sligo, Pa. The legs should be kept clean and the use of water avoided. If an antiseptic solution is required for cleaning the affected parts the area washed should be carefully dried. The application of certain antiseptics under bandages may be applied by your veterinarian. Cleanliness of quarters and tissues affected are of utmost importance in handling this condition.

LUMP JAW.—I have a heifer with calf. She has a lump on the jaw. She eats and drinks and does not show any effects of pain unless it is touched. It seems to be of bony matter and is about the size of two goose eggs. The growth seems to be grown fast to the jaw. I wish you would advise me what to do.—S. L. O., Hegins, Pa. This is probably a condition known as actinomycosis or lumpy jaw. Your veterinarian should be consulted as it may be possible to have this lump removed surgically. If it cannot be removed with safety, the use of potassium iodide internally would probably limit its growth. This drug should be fed under the direction of your veterinarian as dosage would be based upon size of cow and effect of the drug during early administration. Iodesni or iodine poisoning may develop and this marks the limit to which the drug may be used with safety. It is advisable to separate this cow from the herd and to use care in handling as cases may develop in the human family.

INJURY TO HORSE.—By mistake a gallon of motor oil spilled on the barn floor and ran down on the back and hips of my young horse. It has taken the hair off. Is there anything to do to make the hair grow in quickly? I washed the oil off the best I could with warm water and soap as soon as it was noticed. Will it hurt to use the horse if we take the back straps and breeching off so that the straps will not irritate him?—E. L., Carbondale, Pa. The application of carbolized vaseline or zinc oxide ointment every other day should give good results. The horse may be used unless there is further irritation from parts of the harness. In fact it would be of advantage to use the animal for ordinary work. If the parts get wet with rain or snow wipe dry when brought in the stable and apply one of the above preparations.

SORE DIFFICULT TO HEAL.—I have a cow that has a sore on her hip. Two years ago some chickens roosted in the barn and some chicken manure dropped on her and it has been sore ever since. It was a small place but now it is as large as the palm of my hand. The rough scab cracks open and bleeds. She licks it as tho it might hurt. Could you advise me what to do?—W. D. C., Conowingo, Md. It may be necessary to have your veterinarian burn this wound over to destroy the excess of new tissue. Perhaps there is some foreign matter present which causes a continual irritation and should be removed. A mixture of three parts vaseline and one part sulphur will help soften the sore.

PIG IS LAME.—I have a pig that came lame or stiff in his legs and for several weeks it could not stand on its front feet. Has fair appetite and lots of time comes to the trough on his front knees. I have washed its legs in hot water and bathed his legs in liniment. Nothing seems to do any good. I feed one part meal, one part bran and one part middlings. Can you tell me his trouble?—P. H. J., Seaford, Del. This lameness may be due to a lack of proper balance in the diet of the pig. You would probably see a marked change or complete recovery if you would add one tablespoonful of cod liver oil to the feed three times daily for a period of two weeks. A good feed mixture consists of 100 pounds corn meal, 10 pounds middlings, 10 pounds tankage and 5 pounds ground alfalfa or alfalfa leaves.

RECURRENT "SPELLS" OF DOG.—I have a dog one year old. Last Wednesday he was out hunting. When he came to the house he barked real sharp at his mate and wanted to be left alone. He acted tired out, was frothy around the mouth but sat down a while with his tongue out, rested about ten minutes, then acted natural again until Thursday evening when he got a barking spell. He was not natural until Saturday. Sunday morning he threw his head back, his teeth chattered and he stiffened out and was unconscious for about ten minutes. Then he got up and kept walking and staggering, then got quiet. After three more spells I ended his suffering. He had slimy froth about the mouth each spell.—C. S. S., Sugar Run, Pa. This dog was probably suffering either from a foreign body in the stomach or from parasites. Any obstruction of the outlet of the stomach may show itself in barking, yelping and convulsions. Intestinal parasites may also cause this difficulty or they may result in meningitis or inflammation of the brain. The first cause may be taken care of surgically and the second by application of "worming" remedies. Such remedies may be secured from your veterinarian.

THERE'LL soon be lots of work to do. Are your horses ready?

Use Gombault's Caustic Balsam to get them in condition. It's wonderful for Sprains, Spavin, Splint, Capped Hock, Curb, Fistula, Thoroughpin, Shoe Boils, Poll Evil, Wire Cuts and Muscular Inflammation.—Known and used everywhere for 42 years. Apply it yourself. Directions with every bottle. Leaves no scar or blemish. Buy it today, and always keep a bottle on hand for emergencies. $2.00 at drug stores or direct on receipt of price.

The Lawrence-Williams Company

PLEASE say: "I saw your adv. in Pennsylvania Farmer."

Our Veterinarian

PHOTOGRAPHERS aren't always as speedy as they might be, hence we were not able to print a likeness of our staff veterinarian at the time we announced that Doctor J. F. Shigley had joined the editorial staff of Pennsylvania Farmer. We are glad now, however, that we can introduce Doctor Shigley to the scores of readers whose questions he has answered by mail and thru the Veterinary Column on this page during the last few weeks.

Doctor Shigley

Doctor Shigley is a graduate of the Veterinary Department of Cornell University where he served as an instructor in bacteriology and surgery for three and one-half years. Since leaving Cornell he has spent several years as a practising veterinarian, acting as consultant for a number of famous breeding establishments in Minnesota, Kentucky, Delaware, New Jersey and New York.

In his present position as Associate Professor of Veterinary Science at the Pennsylvania State College, Doctor Shigley is charged with the actual care of about 1000 head of livestock on the College farms, work which keeps him in touch with all phases of veterinary practice.

Letters about the ailments of farm animals addressed to Doctor Shigley, in care of Pennsylvania Farmer, Philadelphia, are answered promptly by mail without charge.—The Editors.

Our Readers' Classified Advertising Department

A market place to buy or sell at little expense. Over 60,000 farm families read Pennsylvania Farmer every week. Rate 6 cents a word each for one, two or three consecutive weekly insertions; 5 cents a word each for four or more insertions. Count each number and initial and send cash with order. Orders, discontinuances or changes of copy must reach us by Wednesday of week preceding date of issue. All advertisements set in uniform style, no display type or illustrations. Poultry advertising may run here, but if displayed or illustrations used must run in display advertising columns at commercial advertising rate (55 cents per agate line). Livestock advertising not accepted in this department. Minimum, ten words.

BABY CHICKS—Beginning March 1 delivery. White and Barred Rocks, Reds, Columbian Wyandottes, Buff Orpingtons. All 16c. White Leghorns, 12c to 20c. Mixed 11c. 100% live delivery guaranteed. G. C. Rhoades, Reedsville, Pa.

300,000 CHICKS FOR 1926—White Leghorn, Barred and White Rock, Rhode Island Red and White Wyandotte. They are bred, hatched, priced right. 100% live arrival guaranteed. Catalog free. L. R. Walck Hatchery, R. F. D. No. 3, Greencastle, Pa.

30,000 CHICKS WEEKLY—Leghorns, Reds, Rocks, Minorcas, Jersey Giants, etc. 9c each and up. 100% live delivery guaranteed. Prepaid. Our 16th year. Catalog free. The Keystone Hatchery, Richfield, Pa.

75,000 LARGE husky chicks for 1926. S. C. White Leghorns, S. C. R. I. Reds, White and Barred Plymouth Rocks by prepaid parcel post. Circular on request. Penns Creek Hatchery, Selinsgrove, Pa.

BUY YOUR CHICKS from a poultry farm. 1500 Breeders bred for egg production. Barred and Buff Rocks, Reds, Orpingtons, Wyandottes and Leghorns. $15 per 100. Fairview Poultry Farm, Galion, Ohio.

CHICKS—Barred Rocks, Rhode Island Reds, White Rocks, S. C. White Leghorns, February 2nd, every week thereafter. Prices reasonable. Beshore's Hatchery & Poultry Farm, R. D. 1, Mount Wolf, Pa.

YOUR OPPORTUNITY to get husky, healthy and well bred S. C. Black Minorca chicks from layers of merit at 15c, prepaid. 10% books order. Sunnybrook Poultry Farm, Hanover, Pa.

AT SACRIFICE—10 Buffalo 260 egg incubators and one Prairie State 390 egg capacity, second hand. All in first class condition. Wm. Heimberger & Son, Saltsburg, Pa.

BARRON'S White Wyandotte cockerels $4 up, from stock I imported direct from Tom Barron, England. Records 262 to 313 eggs. Eggs for hatching. E. E. Lewis, Apalachin, N. Y.

BABY CHICKS—S. C. W. Leghorns, Barron strain. Barred Rocks and Rose Comb White Wyandottes. Send for price list. A. O. Moffer, Twin Brook Farm, Strawberry Ridge, Pa.

PURE BRED CHICKS—R. I. Reds, Rocks, W. Leghorns. Circular and price list free. Pleasant Gap Poultry Farm and Hatchery, Box 143, Pleasant Gap, Pa.

QUALITY CHICKS—State accredited. Fourteen standard bred varieties. Best winter laying strains. Free delivery, moderate prices. 64 page catalog free. Missouri Poultry Farms, Columbia, Mo.

"WORTH-WHILE" Baby Chicks, hatching eggs from selected White, Barred, Buff Plymouth Rocks, Reds, Cochins, Brahmas, Leghorns, Wyandottes. Price list free. Fishelton Farms, Hope, Ind.

CHOICE, heavy boned, Barred Rock and R. I. Red cockerels, chicks and eggs. Black Minorcas included. H. E. Akers, Rt. 2, Clearville, Pa.

BABY CHICKS CHEAP—Get our free catalog before ordering. All kinds pure bred poultry incubators running now. Evergreen Poultry Farms, Hatheries, Hampton, Iowa.

CHICKS—S. C. W. Leghorns, 12c; Mixed, 10c. Special prices on large lots. 100% guaranteed. Circular. Meadow View Poultry Farm, McAlisterville, Pa.

CHICKS from heavy-laying strain. Barred Rocks 13c; Mixed, 10c. 100% arrival guar. Circular free. R. J. Ehrisman, Box 50, McAlisterville, Pa.

PURE BRED CHICKS—R. I. Reds, White and Barred Rocks, Jersey Giants, White Leghorns. Catalog free. The Monroe Hatchery, Selinsgrove, Pa.

PURE BRED CHICKS—R. I. Reds, White and Barred Rocks, Brahmas, Anconas, Leghorns. Circular free. Spicher's Pleasant View Farm, Bellefonte, Pa.

LARGE stock fine poultry, turkeys, geese, ducks, guineas, bantams, collies, pigeons, chicks, stock, eggs, low, catalog. Pioneer Farms, Telford, Pennsylvania.

BABY CHICKS and eggs, Superior Ringlet, Barred Rocks, Rose Comb Reds, White Leghorns. Catalog. Wyndham's Ideal Poultry Yards, Tiffin, Ohio.

SATISFIED customers, if you buy our chicks. Rocks, Wyandottes, Minorcas, Leghorns, etc. Certified Breeders. Free circular. Edwin Souder, Sellersville, Pa.

BABY CHICKS—March delivery White and Barred Rocks, Reds 16c; mixed 11c. W. A. Kuhns, Reedsville, Pa.

SILVER LACED WYANDOTTE COCKS $8.00; cockerels $5.00; laying pullets and hens $2.00 each. John Stoltz, Orrtanna, Pa.

MAMMOTH Bronze Turkeys, big bone, unrelated trios, sire 32-pound cockerel. Miss Ida Chumbley, Draper, Virginia.

WHITE WYANDOTTES—Barron 262, 275 egg strain. Fifteen eggs $2.00. Postpaid. Merrell Pease, Bowmansdale, Pa.

MISCELLANEOUS

DOUBLE YOUR INCOME by farming on James Ranch, California. No winter there, no drought. Crops growing 365 days in every year and the best of markets offered anywhere. Land is state inspected and state approved. A going proposition for a successful farmer. Write me for details. Herman Janss, San Joaquin, Dept. 1197, Fresno County, California.

SIZE "B" Victor Combined Churn and Butter Worker. No. 350 Wizard Dairy Pasteurizer. 20th Century Babcock Milk Tester. No. 22 Delaval Separator. For particulars write to H. E. Millard, Annville, Pa.

SEPTIC TANKS—Steel, welded, leakproof, rustproof. The modern, sanitary sewage disposal device for farm home or camp. Write for circular and prices. Agents wanted. Carbondale Welding Company, Carbondale, Pa.

WILSON SOY BEANS $1.50 bushel; Virginia soy beans $2.25 bushel; cow peas $4.00 bushel. Bags 12c each. Joseph E. Holland, Milford, Del.

ALL WOOL knitting yarn for sale from manufacturer at great bargain. Samples free. H. A. Bartlett, Harmony, Maine.

RAW FURS WANTED—Highest cash prices paid. Ship to E. E. Roraback, Phone Chatham 149-F-11, Ghent, N. Y.

DELCO LIGHT PLANT and water pumps. In splendid condition. Write for particulars. Marcus A. McKnight, Carlisle, Pa.

PLANTS, SEEDS, ETC.

SPRING FLOWERS—Collection of dahlia for $2. Isabella Street, Rosalia Styles, Insulinda, Delice, Jack Rose, Queen Mary. Also an accidental mixture 12 for $1. 2 year old Mums in clumps, all colors, 12 for $1. Canna roots, all the finest, 12 for $1. High class gladiolus mixture, all blooming size, 40 for $1 or 100 for $2. Assortment of German Iris, 12 for $1. Peonies (3 to 5 eyes) all colors, 3 for $1, 12 for $3. 2 year old monthly roses 5 for $2. All post paid. Alco Flower Gardens, Alco, N. J.

FROST PROOF cabbage and onion plants. Varieties Charleston and Jersey Wakefields, Succession, Flat Dutch and Copenhagen Market. Prices, parcel postpaid, 250, $1.00; 500, $1.50; 1,000, $2.50. Express collect, 1,000, $1.50; 5,000, $1.25 per 1,000; 10,000 and over $1.00 per 1000. We guarantee to ship promptly a good size plant that will please you. Tifton Potato Company, Inc., Tifton, Ga.

SPECIAL—5 cactus and 5 decorative dahlia tuber $1.00. 12 big canna tubers—Four choice varieties $1.00. 25 large mixed gladiola bulbs $1.00. Delphinum roots select 2 years old 35c each. Trial package of choice mixed aster seed, free with order for dahlias or gladiola. E. R. Hummer, Frenchtown, N. J.

SEED POTATOES—White Triumph (Noroton Beauty) extra early variety, select stock, $4.00 per bushel in sacks F. O. B. here. Charles L. Todd, Hartwick Seminary, Otsego Co., N. Y.

CHOICE Northern Grown Seed Potatoes. Order early, good seed will be scarce later in the season. Write for guaranteed prices. N. A. Baker & Sons, Fairport, N. Y.

MAMMOTH sweet corn seed. 5 lbs., $1.00; 15 lbs., $2.70; 45 lbs., $6.75; 100 lbs., $14.00. Wm. Favier, Neshanic Sta., N. J. Tel. 394F5 Neshanic Sta.

FROST PROOF cabbage plants will give you headed cabbage three weeks earlier. Write for catalogue and full particulars. Piedmont Plant Co., Albany, Ga.

WASHINGTON ASPARAGUS—Most modern variety, sturdy one year roots $12.00 per 1000. C. W. Bowen, New Cumberland, Pa.

APPLE TREES 25c. June budded peach trees 15c. Cherry trees 40c, prepaid. Catalog free. Malta Nursery, Malta, Ohio.

CORN—1,000 bu. of Lancaster Co. Sure Crop. Large or small quantities. Willis G. Kreider, Kinzers, Pa.

CERTIFIED Luce's Favorite seed corn $2.50 per bu. F. O. B. Henry Jennings, Southold, Long Island.

POTATOES—Carman, Cobbler, Mountain, Triumph, others. Ford, Fishers, N. Y.

TOBACCO

PIPE SMOKERS—"Luxury" the supreme smoking mixture. A cross-cut of Burley, Virginia, Latakia, Perique. Aged, blended and flavored for connoisseurs. Half pound patent tin humidor $1.25 postpaid. Real pipe joy guaranteed or money refunded. Carney-Graham Company, Paducah, Kentucky.

HOMESPUN TOBACCO—Chewing five lbs. $1.50; ten, $2.50; smoking five lbs. $1.25; ten $2; cigars $2 for 50, guaranteed, pay when received, pipe free. Roy Carlton, Maxon Mills, Kentucky.

HOMESPUN TOBACCO—Chewing, five pounds, $1.50; 10, $2.50. Smoking ten $1.50. Satisfaction guaranteed. Pay when received. United Farmers, Bardwell, Kentucky.

HOMESPUN chewing or smoking tobacco—5 lbs. $1.25, ten $2, twenty $3.50. Satisfaction guaranteed. United Farmers, Paducah, Ky.

HENDERSON'S NEW OFFER

1926 Seed Catalogue and 6 Packets of Flower Seeds —Only 10c

What this book contains

204 pages packed with valuable garden information. Over 1,000 pictures showing actual results from Henderson's tested seeds. Describes hundreds of varieties of flowers and vegetables perfected by Peter Henderson & Co., through 78 years' experience.

Offers dozens of specially selected collections of flower seeds arranged especially for harmony of color and continuity of bloom. Tells you when to plant the different varieties of flowers and how—valuable cultural directions which guide you in making your garden more beautiful and more productive. Includes a calendar of planting dates for flowers. Gives proper remedies for insects and fungus. Illustrates necessary garden implements, their uses, prices and complete description.

Get this Henderson catalogue before you buy flower seeds. Clip the coupon now!

MAIL coupon with only 10c and we will send you "Everything for the Garden," Henderson's new seed catalogue, together with Henderson's new flower seed offer—6 packets of tested flower seeds.

These six packets of flower seeds include Henderson's most famous specialties—Henderson's Invincible Asters, Brilliant Mixture Poppies, Giant Waved Spencer Sweet Peas, Single Large Flowering Mixed Petunias, New Giant Large Flowering Mixed Zinnias, Large Early Flowering Mixed Cosmos—the loveliest and most prolific of their kind. These seeds, like all Henderson's seeds, are tested seeds.

Many of the accepted methods of testing seeds were originated by Peter Henderson over a generation ago. These methods improved by years of experience, still safeguard the standard quality of Henderson's Seeds.

Giant Waved Spencer Sweet Peas
Henderson's Invincible Asters
Single Large Flowering Mixed Petunias

Coupon Envelope Counts for Cash

This special collection of flower seeds comes to you enclosed in a coupon envelope, which, emptied and returned to us, will be accepted as 25c. cash payment on any order of a dollar or more.

. . .

How 6¢ extra for spraying rewarded a Tennessee farmer

A Marshall County, Tennessee, farmer has a ten year old peach tree that never bore a salable crop until last year when he decided to spray his trees four times. It took only six cents worth of spray per tree. *And the fruit on this ten year old tree alone brought him* $12.00.

How a few cents extra for Mobiloil repays any farmer

A few cents extra per gallon for Mobiloil has repeatedly paved the way to equally important savings on the farm.

In passenger cars and motor trucks, Mobiloil often cuts oil consumption from 10% to as much as 50%. Many farmers report that Mobiloil has more body after four days' work in a tractor than ordinary oil has after two days' work.

But Mobiloil doesn't rest its case on this big saving alone. Mobiloil has marked ability to reduce carbon formation, overheating, and breakdowns. Mobiloil's all-around economy gives it by far the highest standing of any oil used on farms today.

Why there are several grades of Mobiloil

Make the CHART *your guide*

THE correct grades of Gargoyle Mobiloil for engine lubrication of prominent passenger cars are specified below.

The grades of Gargoyle Mobiloil are indicated by the letters shown below. "Arc" means Gargoyle Mobiloil Arctic.

Follow winter recommendations when temperatures from 32° F (freezing) to 0° F (zero) prevail. Below zero use Gargoyle Mobiloil Arctic (except Ford Cars, use Gargoyle Mobiloil "E").

If your car is not listed here, see the complete Chart at your dealer's.

Let us suggest that you get out the instruction books that came with your tractor, truck, car and stationary gas engine. Compare the differences in the design of the motors. You'll see why no one grade of oil can possibly give the greatest economy in all your farm engines.

Your Mobiloil dealer has the complete Chart of Mobiloil Recommendations. Through the Chart he can tell you exactly what grades of Mobiloil are scientifically correct for your engines. 465 manufacturers of automobiles and other automotive equipment have approved this Chart. It represents the knowledge and experience of the oldest and largest company specializing in lubrication. You will find that following this Chart is the safest and the cheapest way to buy oil.

A Flying Trip thru the Middle West

Some Car Window Observations on Farm Conditions between Chicago and Denver

By W. H. TOMHAVE

A GREAT deal has been said and written during the past few months about the corn problem of the farmers in the Middle West. There is no question of the existence of a real corn problem. Many suggestions have been made as to how this problem might be solved, but just what the outcome of all these suggestions will be remains to be seen.

The enormous corn crop in this section and the well matured crop in all parts of the country has resulted in a light demand for corn from the marginal corn producing states. It is generally conceded, however, that there would not have been a corn problem this year if the farmer had the normal supply of cattle in the feed lot and the normal supply of hogs to fatten.

During the week of January 16 the writer took a trip from Chicago to Denver, Colorado, and passed thru the greater part of the states of Iowa and Nebraska in daylight. One taking this trip can not help but be impressed with the hundreds and thousands of acres of land that are annually devoted to the growing of corn, and wonder where all the corn that is produced finds an outlet on the market directly or indirectly. After a trip thru this section a person can fully understand why Iowa is known as the center of the Corn Belt.

Enormous Corn Crops

The corn crop in the Middle West is grown on a much larger scale than in the East as it is the principal crop produced. Instead of being topped or cut and shocked, as it is in the East, it is all husked in the field and the stalks allowed to go back to the soil. Cattle and horses roam over these fields during the winter months and salvage as much as they can of the remaining stalks and husks. On practically every farm, work horses and breeding cattle are in the stover field from early in the morning until late at night. Anything that remains on the field in the spring is plowed under to add humus to the soil.

The enormous corn crop is stored in every conceivable manner. Cribs are filled to capacity, much of it is stored in temporary cribs of woven wire without a roof, and in many cases it is found in huge piles on high ground in the barn yard, from which it is fed to livestock. This method of storing corn would be looked upon as a wasteful and extravagant method of handling by eastern farmers but the Corn Belt Farmer had no choice in the matter this year. Last fall it was very wet thruout all parts of the Corn Belt with the result that much of the corn was stored with a large amount of moisture and there will not be as much marketable corn as was estimated on January 1st.

The farm buildings in the Middle West are not to be compared with those of most eastern farms. No attempt is made to put the crops in the barn because of the amount of space that would be required to house the crops that are produced. Farmsteads do not present the same attractive appearance that is found on so many farms in eastern Pennsylvania. This is probably due to the fact that the acreage is greater in the Middle West and there is less time available to devote to improvement about the homestead.

The eastern farmers have a decided advantage over the western farmers in improved roads. The main highways thru Iowa, Nebraska and Kansas are in many cases improved but many of the less important roads are dirt roads. The actual task of building roads is not as difficult as in the East because of the contour of the land. There are very few hills or valleys. Road building material, however, is more difficult to obtain and must be shipped a considerable distance in most cases.

Cattle and hog feeding is conducted on a more extensive scale than in the East. The cattle feeding is practically all done in open sheds or in many cases in the open yards. Hogs are handled very largely in the same manner. Silos dot the landscape in every direction which indicates that silage is one of the most universally used feeds for fattening cattle. Sheep feeding is conducted in some sections, but such plants are not as numerous as cattle and swine feeding establishments.

It Is Small but Powerful

This fifteen horsepower electric motor is used for threshing, silo filling and other belt work on Sarnowski Dairy Farm, Schenectady County, New York. Clogging of the blower is eliminated by its reserve power and constant speed.

In passing thru the central part of Iowa it seems that most of the land is devoted to growing corn. There are very few sections where wheat or hay crops are extensively grown. Oats seem to be the principal small grain crop. In Nebraska and Kansas conditions are quite different. Wheat fields can be seen in every direction and a greater amount of land is devoted to hay crops. In many sections, especially western Nebraska and Kansas, there are vast areas of grazing lands that have never been cultivated.

A View of the Rockies at Daybreak

Practically the entire distance from north central Kansas to Denver was traveled at night. There was hardly any snow on the ground in the region between Des Moines, Iowa, and Belleville, Kansas. Even tho the trip was made the middle of January it seemed like a most delightful spring day. On the return trip the entire section was covered with a light blanket of snow.

After traveling all night in the direction of Denver one gets a splendid view of the Rocky Mountains at daybreak which came when we were about thirty miles east of Denver. The ground was covered with several feet of snow, and instead of seeing a country covered with farm homes we were passing thru the range country. Farm homes were comparatively few and these were, in most cases, one-story structures. Very little of this land is under cultivation, being used almost entirely for grazing purposes. This is only one section of Colorado and from all reports there are sections where splendid crops are produced.

The city of Denver is one of the most important industrial centers of the mountain region. It is a beautiful city of about 300,000 inhabitants with numerous industrial plants, wholesale houses and beautiful residences. It is the gateway to the mountain region and the Southwest. It is also one of the important livestock market centers of the country. These have been developed in connection with the stock yards and large meat packing plants.

The National Western Livestock Show is held annually at the stock yards. This show is unique in character and is in a class by itself. The stock consists of breeding and market animals. In the barns were the single entries of beef and dairy breeding cattle, and of steers, horses, sheep and swine. In the yards the carload entries were exhibited. These consisted of feeding heifers and steers—fat steers or heifers and carloads of purebred breeding bulls and heifers.

There is probably no other show of importance in this country where so many carloads of breeding bulls are on exhibition. These consisted very largely of Herefords with a few scattered entries of Shorthorns and Aberdeen Angus. They are judged and then sold at auction or private treaty. Practically all go onto the ranges of the western states.

Feeders for the Corn Belt

The feeding cattle, which this year consisted very largely of calves and yearlings, find their way into the Corn Belt for feeding purposes. The fat cattle are purchased by the packing plants at the Denver stock yards. The Denver show, being in a strong Hereford section, has more Herefords on exhibition than any other breed. This is the first time that Aberdeen Angus cattle have been able to capture the championship in the fat carload division. The champion carload of feeders were Herefords. The grand champion steer on foot was a junior yearling Aberdeen Angus exhibited by the University of Nebraska. The grand champion single steer sold for $1 per pound and the grand champion carload sold for $19.75 per cwt. Both purchases were made by railroad companies for their dining car service.

Denver is one of the most important sheep markets in the United States. Many of the feeding lambs from the southwestern states are sold thru the Denver market. Colorado and other states fatten a large number of lambs each year for this market. The sheep show at the National Western Show was small but the quality of the lambs and wethers on exhibition was excellent.

Swine are not very extensively produced west of Kansas and Nebraska. As a result of this condition only a few carloads and a few breeding and fat swine were on exhibition.

The prices received for the range bulls at the Denver show is usually looked upon as a fair indication of the prices that will prevail for range bulls during the spring. Yearling bulls are in greatest demand but older bulls are purchased if the supply is short. The prices received this year were about $50 higher than last year, selling at prices ranging from $150 to $300 per head. There was no difficulty in selling bulls this year. Practically all the bulls were sold by the middle of the week and many more could

"U.S." Blue Ribbon boots are made with sturdy gray soles. The uppers are either red or black—knee to hip lengths.

Tough
and rugged—
built for real comfort!

Why it pays to buy "U. S." Blue Ribbon Boots and Overshoes

YOU wouldn't expect a race horse to do a draft horse's work. And it's the same way with boots or overshoes.

A boot or overshoe must have rugged strength and toughness built all through it—if it's going to stand months of solid work on the farm.

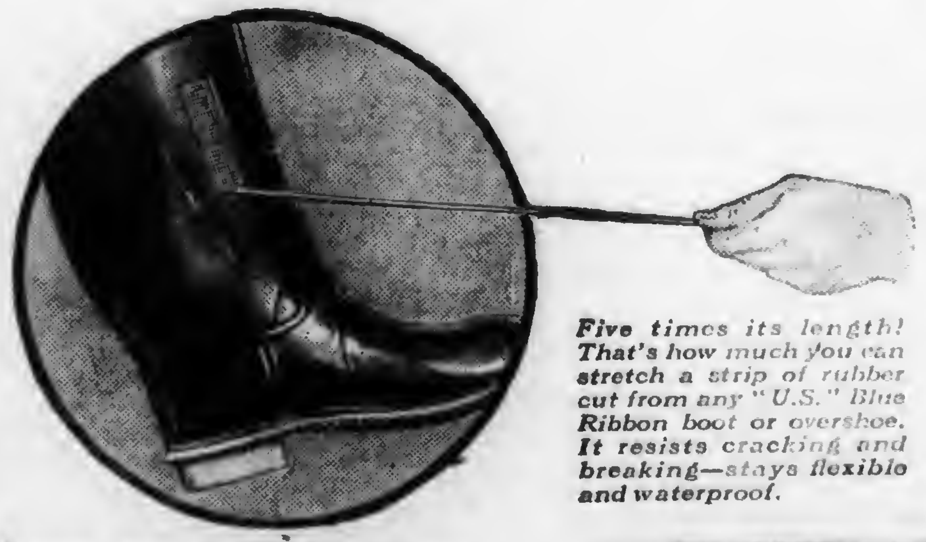
That's just what you get in "U. S." Blue Ribbons! They're built to give the longest wear a boot or overshoe can give.

"U.S." Blue Ribbons are made with thick, tough oversize soles. In the uppers is put rubber so elastic it will stretch *five times its length!* It stands the constant bending and wrinkling that make ordinary rubber crack and break. From 4 to 11 separate layers of tough fabric and rubber reinforcements give *extra* strength wherever strength is needed.

Master workmanship—the experience of more than 75 years in making rubber footwear—goes into "U.S." Blue Ribbons. They're built *right* all over.

Ask for Blue Ribbons. *It will pay you!*

United States Rubber Company



Five times its length! That's how much you can stretch a strip of rubber cut from any "U.S." Blue Ribbon boot or overshoe. It resists cracking and breaking—stays flexible and waterproof.

NESHAMINY GARDENS

Where an Editor Works and Thinks

By R. P. KESTER

A BEDFORD County reader asks whether the Red Spy and the Oswego are one and the same apple. Also, what qualities the Golden Winesap has that are better than those of the Golden Delicious.

I remember a controversy which was carried on several years ago concerning a highly colored Northern Spy. It was claimed that it was a sport of the Spy and a distinct variety. Others claimed that the redder color was due to local conditions of soil and exposure. Neither the Red Spy nor the Oswego is listed in Hedrick's Cyclopedia of Hardy Fruits. The Golden Winesap is not yet sufficiently well established to give it standing.

* * *

AMONG the letters received in response to my inquiry as to the success readers have had in raising bought day-old chicks is a letter from Mrs. Morehead of Clarion County, Pennsylvania. She says:

"On May 7, 1925, I received 310 chicks. I had only a rude corn crib to house them in. I dipped their bills in buttermilk as I took them out and placed them on a sand-covered floor. I had a big coal stove with a piece of tin over it to throw the heat on the floor. We had a cold wet spring, but as soon as possible I let them out on the ground. I fed them rolled oats for three days, then began feeding baby chick feed and mash and kept buttermilk and water by them. In June I had 306 chicks. I separated them in July and found I had 171 pullets and 135 roosters. Of these I lost three later. I think the trouble most people have in raising chicks is due to feeding too much before they are two weeks old. They should be hungry and hunting all day long."

* * *

THAT is one of the best chicken articles I have read in a long time. Practically the whole subject of raising chicks successfully is told in about one hundred words. Other writers for farm papers please note. Of course, it is altogether likely that the stock from which Mrs. Morehead's chicks came was free from the germs of white diarrhea. This is a matter which all poultry raisers must take into account, and then act accordingly. The question has been pretty well solved by scientific men, and poultrymen must cooperate or fail sooner or later. Practically all the states are taking up the work of certification now and we believe the time will come when white diarrhea will be far less prevalent.

* * *

A FRIEND of mine who annually raises several acres of potatoes bought a carload of certified seed last fall. Now he is waiting to see what such seed sells for this spring. If it brings as much as five dollars per bushel, he proposed to sell the seed he bought and thus make his potato profits in that way instead of raising a crop.

* * *

STRAWBERRIES from the South have been unusually high this year, probably due to the fact that the cold spells this winter have extended farther than usual. Heretofore I have indulged in my one extravagance on my birthday in January, that of buying a box of fresh strawberries. For several years I have been able to get a box for less than a dollar,—sometimes as low as seventy cents. This year at that time they were displayed at one dollar and a half, and my economical soul vetoed the proposition and we did not have them.

* * *

WE HAVE been using bituminous coal for about a month and are having our troubles. It burns well, makes a hot fire and is easily kindled, but furnaces built for hard coal do not adapt themselves kindly to soft coal. The latter makes so much more smoke and soot that the pipes and flues are soon choked up and you have trouble. I covered the fire the other night and found the smoke simply would not go up the chimney but belched out into the cellar and hence up into the house. We were raised with bituminous coal and knew nothing else until we came East a few years ago. We had to learn how to burn anthracite coal, but now that we have learned it we find that we do not want to experience another interruption in the supply by strike or otherwise.

THE CHEERFUL PLOWMAN

Taming Old Jayhawk!

OLD Jayhawk was the wildest cat when first he came along, he was as timid as a rat, alert, and scared, and strong! I glimpsed him first out by the shed, his fur was rough and coarse, his eyes gleamed fiercely in his head with challenge and with force. He shot a fiery look at me then dashed away to hide, raced madly up an oaken tree without a chart or guide. "That cat is what I call a prize," I told myself that day, "I like the ginger in his eyes, I like his manly way! If I can tame that mammoth beast I know I'll have a chum! Hey pussy, here's a dandy feast, come kitty, pussy, come!"

It took long days, yes weeks, I think, before he'd venture nigh to eat a bite or take a drink if I was standing by, but slowly, slowly, I prevailed until one summer day when I approached the rascal failed to dodge or dart away. Then things went fast, he climbed my knee and rubbed against my check, as tame a cat as one could see, affectionate and meek!

His case is plain,—scared in his youth by some gent crude and mean, someone without a heart in truth, who wore a scowl, I ween. The cat, of course, said to himself, "All men I must escape, or I shall go upon the shelf perhaps with throat agape!" "All men,"—so when he came to me of course I had a chore to coax him up on to my knee, to pet and win him o'er! Ding bust the man, he must be blind, who frightens cats or boys, who shakes their faith in human kind, and stunts their hopes and joys!—J.Edw. Tuft.

A Day's Work in Two Hours

"I now do in a couple of hours with my Fordson the work it formerly took a day to perform," says Milton Zeter, whose farm is near California, Ohio.

"This is the third year I have had my Fordson and it has paid for itself several times. I can put the ground in much better condition and, as a result, there has been quite an improvement in both the quality and quantity of my crops. It has enabled me to overcome the handicap of time in the early spring.

"I've kept a record of the cost of operating my Fordson and find my average cost for plowing is 65c an acre.

"During the winter I use the Fordson for sawing wood and various odd jobs.

"I also have a Ford Touring car, purchased in 1919, a Ford Sedan bought in 1923, both of which are used almost daily and giving excellent service; as well as a Ford One-Ton Truck, bought in 1920, which I use for hauling my produce to market."

You can do more this year with a Fordson. Ask the nearest Ford dealer about the easy payment plan.

Vol. 93, No. 9 Phila., Pa., Feb. 27, 1926 Whole No. 1502

OUR JOB is to serve our readers. Whenever you are puzzled write to us and we will help you if we can.

"The patience to wait and the willingness to work is the foundation of all lasting achievement."

The Ayes Have It

THE statement so often heard in the city that farmers are a complaining lot, unappreciative of the advantages of living in the country, is completely discredited by the letters we are publishing on pages 28 and 29 of this issue. We asked our readers to tell us why they do, or do not, want their sons to become farmers. Of the scores who wrote, eight out of nine believe that a career on a farm is the best thing for their sons to look forward to, all things considered. Some of the letters from those who did not want their sons to take up farming as a life work will be published in next week's issue. There were so many good ideas in almost every letter received that we regret keenly that we cannot share all of them with our readers.

The Northwestern Invasion

STORIES of the destruction wrought in the Lake Erie region by the European corn borer have sounded almost like myths to many farmers in eastern Pennsylvania. It is hard to believe that any small insect can completely destroy a thriving crop of the king of grains. Yet this pest, believed by many to be more of a menace than the Japanese beetle or the Oriental peach moth, has already done considerable damage in northwestern Pennsylvania and is spreading toward the east and south at an alarming rate. The worst infested counties are Erie, Crawford, Mercer, Venango, Warren, Forest and McKean.

Director Hadley, of the Pennsylvania Bureau of Plant Industry, states that in many parts of the infested area of this state the average infestation was higher than one larva per stalk last year. In 1923 the average infestation in Ontario, Canada, just across Lake Erie from us, was one larva per stalk. Two years later thousands of acres in that same area were so badly riddled by the borer that not one bushel of corn was harvested.

This pest spends the winter in unharvested corn stalks and corn stubble. The destruction of all remnants of the corn crop before May 15 is the only control measure that has been found effective. Farmers of northwestern Pennsylvania have a big task before them in their attempt to clean up all left-overs from last year's corn crop. But everyone hopes they will do the work well, for the sake of all corn growers.

Find Out the Cost

A READER living in Bucks County, responding to our inquiry for suggestions, says that it would be very helpful if farmers would send in accounts of what it cost to produce a given unit, or what was the net profit per bushel, pound or hundred-weight. He feels that the tendency with all educational agencies is too much in the direction of excellence in production, and that too much emphasis is placed on winning prizes for the most bushels per acre, eggs per flock or pounds of milk per cow. What the business farmer really wants to know is how to get the most profit per acre, per cow and per flock.

That is a good point and well taken. Pennsylvania Farmer has been emphasizing this phase of the farming business from the first. The highest production is not always the greatest profit maker, altho the acre, animal or tree which has the inherent power to produce abundantly will produce the most profit when properly managed. Profits in agriculture, as is the case with every other business, depend upon producing just the quantity and quality demanded by the market. A large surplus in quantity will always spell disaster. Let us give more attention to the profits end of production and give first place to the one whose profits are greatest. A few years ago a man in North Carolina raised more bushels of corn on an acre than had ever been raised before and he has not been beaten since, but he would have lost money in doing it if he had not received $500 in prize money.

Standardizing Farm Products

A PUBLIC hearing will be held in Harrisburg on March 1 on the proposed official standard grade for certified seed potatoes. The standard that has been followed in Pennsylvania up to this time has been satisfactory, but with the promulgation of an official grade growers can be protected from possible violations of the regulations by the prosecution of offenders.

The adoption of official grades for farm products and the use of those grades by farmers comprise one of the most important steps that can be taken in the solution of the marketing problem. The business of selling will be greatly simplified when farmers are so familiar with grading that the buyer will be willing to pay for commodities he may never see, simply because they have been sold by a responsible producer as U. S. Number 1 grade, or U. S. Number 2.

For Land Control

LLOYD GEORGE, ex-Prime Minister of England, has proposed that the government take the increment from land which the public creates. By this it is meant that the government shall assess against the land owner the increase in value which public improvements give the adjoining land. He argues that besides being a just principle it is the only way in which highways and other public improvements can be made and paid for. This was the contention of Henry George, the father of the Single Tax idea. The proposition has made slow progress so far in this country, largely owing to the opposition of land speculators and to the lack of understanding on the part of the great majority. But when and if the economic conditions in this country reach the point where they are in England just now, people may begin to inquire whether it is just for the public to pile up wealth for the land holders by making developments and public improvements.

Fewer But Better Farmers

THE figures giving the farm population show that there are 175,000 fewer people living on farms in New York state than there were in 1917, and that the number of hired men on farms in 1925 was 29,100, while in 1916 there were 77,000. Yet, in spite of all this the production of New York farms has not fallen off. This means one of two things; either the farm people are working harder and longer, or they have adopted machinery and better methods.

What is true of New York state is true of most other states. There is no immediate cause for alarm in the situation when figures alone are considered. But we should not stop there. If machinery and better methods had been adopted first, thus releasing surplus men, their leaving would not be a matter for concern. But the people left first because of economic reasons and their places were taken by substitutes. The economic condition of farmers must continue to improve if the desertion of farms to the cities is to be stopped. We can't continue the present movement indefinitely.

The Legislature Adjourns

THE principal achievement of the special session of the Pennsylvania Legislature, which came to an end on February 18, seems to have been the manufacture of a number of issues to be fought over in what promises to be a bitter political campaign during the next few months. The most of the measures, the need for which was given by the Governor as his reason for calling the extra session, were marked for defeat from the first. One of Mr. Pinchot's prohibition enforcement bills got thru, however, and is now a law. Of the six other bills that were passed during this extra session, one of the most important was an appropriation bill providing $254,000 to pay the expenses of the session.

Dog Law Upheld

THE constitutionality of the Pennsylvania dog law is upheld by a decision handed down last week by Judge Edward M. Biddle, Jr., in the Cumberland County Court. This decision is of real significance to the farming industry of the state. The dog law is important because it has enabled the Bureau of Animal Industry to eliminate, to a large degree, the damage the livestock industry formerly suffered from roaming, unlicensed, ownerless dogs. And the funds derived from the licensing of dogs furnish much needed support for some of the other very important work carried on by the Bureau.

Washington Letter

EUROPEAN PRODUCTION INCREASING.—Present conditions in Europe do not lend much encouragement to those who are making a paramount issue of the crop surplus disposal question in this country. Indications are that the foreign demand for American farm products in 1926 will be no better than in 1925, if as good, unless an unfavorable season should reduce production abroad of competing products. Reports to the Department of Agriculture show that while the purchasing power of foreign countries may increase production there is also increasing.

Indications are for a weak foreign demand for American corn from now until harvest. Crops in all the important corn growing countries have either turned out well or have favorable prospects.

The British market for fruits has been essentially sustained at the high level reached during the past few years, altho there was a slight falling off in apple imports into the United Kingdom.

TOO MUCH TAX REDUCTION.—The revenue tax bill, having passed the Senate, is now in conference. Chairman Green, of the House Ways and Means Committe, estimates that under the Senate bill as passed the annual reduction would total nearly $600,000,000. This would leave a heavy deficit which would have to be made up by bond issues. The House leaders declare they will not stand for this unnecessary cut in income taxes. They will not accept the Senate bill. This will mean a compromise.

The Senate eliminated completely the taxes on inheritances, automobiles and admissions. It is expected that a trade will be made along this line: The elimination of the estate taxes will stand. In exchange for this point the Senate will accept the House demand for a tax on admissions and automobiles.

Farm organization leaders see little in this tax reduction legislation to help the farmers. With this excessive tax cutting they see little hope of reducing the government indebtedness, and thereby eliminating the enormous share of government expenditures which go to pay interest charges.

WHY GIVE THEM OLEO?—The menus submitted by the board of managers of the military hospitals show that butterine is served at all meals, while no mention is made of butter being served. The information was brought out later in the discussion that some butter is being served in army hospitals. But it is thought probable that representatives from the dairy states will find out the reason why butterine is given preference over butter in these government hospitals, and make efforts to provide the disabled veterans pure, wholesome creamery butter.

NEW STANDARD CONTAINER BILL.—Like the proposed truth in fabrics legislation a standard containers bill comes up in each Congress to be discussed in committee hearings, and then passed over until another session. This year a new bill introduced by Representative Randolph Perkins, of New Jersey, to fix standards for hampers, baskets, etc., has been referred to the committee on weights and measures.

The exact size of each standard container in cubic inches is prescribed in the Perkins bill. It is left to the Secretary of Agriculture to allow such tolerances as he may find necessary to provide for reasonable variations occurring in the course of manufacturing and handling. A standard three-fourths bushel basket is provided, in addition to the other sizes.

URGES T. B. INDEMNITY APPROPRIATION. — Our government appropriates vast sums to protect the country against plant pests and animal pests, but here is a matter which has to do with the protection of the babies, Senator Copeland, of New York, told the Senate Appropriations Committee, while speaking in favor of Senator Pepper's amendment to the agricultural appropriations bill increasing the appropriation for bovine tuberculosis eradication work to $6,000,000. It is generally understood, he said, that pulmonary tuberculosis is not the result of drinking milk, but bone diseases of children are directly due to infected milk.—E. E. Reynolds.

Harrisburg Letter

PLAN NEW POWER FIGHT.—In the midst of discussion of continuance of movements for enactment of proposed legislation failing at the special session ending a few days ago, very definite plans are being made for a new fight for the Giant Power program, especially for rural districts. The criticism has been made that the rural side of the power bills was not stressed and it is likely more attention will be given to this phase in making power an issue in legislative campaigning this fall. Governor Pinchot says he means to continue the Giant Power Board and arrangements are being made to conduct further studies. The Public Service Commission will hear argument in the application for revocation of the rural power regulations on which so much time was spent and it is possible some changes may be made instead of the whole scheme of control being withdrawn.

LAY OUT WORK FOR 1927.—The state administration is now in a position to lay out some work for submission to the Legislature next year because one of the functions of the Governor is to address the new Assembly just before he leaves office. It is probable several matters of rural concern will come to the front, especially in the matter of utilities.

MORE TOWNSHIP MONEY.—Already there are signs the next Legislature will face demands for larger appropriations for aid of township highways. Resolutions are being adopted favoring more extensive grants. The situation, however, next session is going to be that road appropriations will have to come out of general revenue except what is provided from motor vehicle licenses as the proceeds of bond issues will be largely used up in the big road construction program of this year and nothing more can be voted upon until 1928. As that year voters will be confronted with other bond issues just what is going to happen about roads is a subject for careful study.

SNOW GENERALLY DEEP.—Reports to the Department of Agriculture indicate the snowfall is generally heavy all over the state and in the northern tier and the mountain counties farms are covered more than usual. The amount on mountains is such as to cause apprehensions in event of a sudden thaw.

It takes more than one arrest to break a crime wave

STUDY WHEAT LOSSES.—The Bureau of Markets, which has been giving much attention to the situation as regards car lot supplies of produce and development of truck routes for supply of communities will shortly have results of study of losses in wheat suffered by Pennsylvania farmers owing to grading and other causes. The loss is said to run very high. This month the success attending development of new types of soft wheat is being related at conventions in various parts of the country. Warnings against smutted wheat are about to be given in departmental bulletins.

WARN OF HOG CHOLERA.—The Bureau of Animal Industry is renewing warnings against hog cholera and urging that buyers obtain first hand information as to health of animals bought at sales. In some of the southern counties failure to take this precaution a few years ago led to clamping down of quarantine which lasted for months.

RED SPIDER AGAIN. — State "bugologists" have turned up the troublesome red spider on fruit trees in a number of counties in late reports and results of experiments on sprays are being made available.

ROAD MAKERS HUNTING LABOR.—Owing to the numerous contracts being let for road work by the state this year and prospects of more before June, contractors are making still hunts for labor. Some of the grading contracts let are very extensive and there will be demands when the season opens for many men.

REDISTRIBUTE MONEY.—Hundreds of thousands of dollars have been made available for matching county appropriations for road work on secondary highways by the new order redistributing money not requisitioned. This money should be available during the summer and fall, it is said here.—Hamilton, Harrisburg.

New Jersey Letter

AUTO INSURANCE HEARINGS.—The compulsory automobile liability insurance bill brought forth a large crowd in early February at the legislative hearing on the subject. The discussion largely centered upon the legal phases of the measure and with practically no organized opposition except from some of the motor club and trade associations. Exponents of the bill believe it will be passed with technical amendments. At the hearing, State Motor Vehicle Commissioner Dill said that fifty per cent of the automobile accidents in New Jersey are caused by cars upon which there is no insurance. Another bill has been introduced in the Senate which would make it a misdemeanor to operate a car in New Jersey unless covered by insurance or similar protection.

ATLANTIC CITY FARM MARKETS.—The plan of the New Jersey Bureau of Markets for the appointment of a city market director and service to both consumers and growers has been approved at Atlantic City, which will shortly appoint a city market director. The Atlantic City plan is similar to the successful farmers' markets in Camden, Burlington and Trenton. The director will function closely with the State Bureau of Markets and will supply a price publicity service to consumers thru the local papers on days when the market is open. Plans for extending the market director idea are being considered for Perth Amboy and Asbury Park.

NORTH JERSEY MILK NOTES.—The interest of milk producers in Sussex, Warren and Morris Counties in mid-February was centered upon marketing plans for the coming year. This month is the period of withdrawals from the Dairymen's League Cooperative Association and leaders in the industry have been watching the section closely to observe the trend of action in this regard. To date the number of withdrawals has been small and general optimism appears to prevail that the cooperative marketing plan of the League should be supported. Producers continue to maintain, however, that their local contact with good nearby markets makes possible better prices under independent selling methods.

EGG RECORD PLAN GAINS.—This winter has seen a wide acceptance of the plan of the State Department of Agriculture for certification of poultry flocks, registration and record of performance. The latter phase of the poultry work conducted by the department is relatively new. Inspectors from the department check up on the trap-nesting records as supplied by the individual producers, and the result is that farmers have official records of the performance of their flocks as well as certification of the pureness of blood.

WAITING ON GAS TAX.—Farmers are watching closely to see the action of the state legislature on a gasoline tax this year. Interest has quickened somewhat, recently, due to the strong position which New York farmers maintained at a recent hearing in Albany on the gas tax bill now pending in the New York state Legislature. The New Jersey proposal would carry with it lower license fees on ordinary cars and larger fees for heavier trucks.—B.

New York Letter

LICENSE IS URGED FOR STOCK SALESMEN.—R. E. Owen, a Cortland banker, prompted by recent attempts of questionable salesmen of stock to operate in his city, suggests that if Chambers of Commerce require corn plaster salesmen and shoe string salesmen from out of town to pay a license to operate that it would be a good policy to require fake salesmen who sell blue sky for thousands of dollars to get a license before they operate. "Make them show their credentials and let us know that they are selling honest goods." The city fathers will devise some such plan at their next meeting, as scores and scores of their inhabitants and farmers of this county have been victimized, some ruined, by activities of this sort. They recommend that an even better method of checking this deplorable victimizing of unsuspecting people lies in legislation that will require a license, and an announcement of their presence and intentions before such fly-by-nights can begin business. If their offerings are legitimate and sound the license and announcement will be no hindrance, but rather an advantage to the salesman. None other are wanted or should be tolerated.

RURAL INTERESTS SUPPORT TAX ON GASOLINE.—Farm and real estate interests at the state capital are favoring a state tax on gasoline, following the endorsement of the State Grange. City interests are opposing the plan. The joint legislative committee to consider the two bills, one favoring a two-cent tax, and the other favoring a one-cent tax, has deferred action until next week. In the meantime, Dr. George F. Warren, noted farm economist, announces that he does not approve such a tax unless it takes the place of the present high registration fee, or a part of it. Proponents of the plan see a relief for taxes on real estate, in that a one-cent tax would produce about $8,000,000 annually for state and county roads. Opponents say it will increase bus fares to passengers. Dr. Warren thinks that too high a gas tax or license fee virtually makes the road a toll road. He would have the state pay all or nearly all the expense of improved roads, as they are now really urban highways. A tally of traffic shows but one to five per cent of the traffic to be rural. Farmers are now paying too much of the expense of roads, and they still would be, with either a two-cent or a one-cent gas tax superimposed.—M. G. Feint.

IN THE FINAL ANALYSIS DUSTING IS RIGHT

1. It Assures Clean Fruit. **2. Cuts Labor Costs.**

1. Dusting enables a grower to cover his entire orchard with pest destroying material in the shortest possible time and *timeliness* of application is the biggest factor in pest control.
2. Dusting helps solve the labor shortage problem. Figure it out for yourself. One man and a boy can cover an orchard in one-fourth to one-fifth the time it takes a spraying *crew* to do the same work.

Such being the case, in order to grow and market fruit most profitably, every orchardist must learn and know how to employ the most successful methods of dusting practice. To make this possible the Niagara Sprayer Company has developed a highly trained scientific organization to cooperate with all users of Niagara Dusts and Dusters and advise not only on each man's individual dusting problems but also to keep him constantly in touch with the newest and latest developments in dusting practice.

Ask us about

Niagara KOLODUST

Niagara KOLOTEX

The new NIAGARA "Kolo" Dusting Materials that you can see stick.

DUSTING THE NIAGARA WAY Is a Guarantee of Right Dusting

First it assures the use of Dusting Machines that have been developed to sturdy perfection by years of actual practical use. Second it assures the use of Dusting materials that are known from one end of the country to the other for quality and effectiveness. Third it assures that both dusters and dusts will be used to the best advantage to produce results by means of scientific cooperation from Dusting Headquarters.

Every grower will find it to his advantage to investigate the Niagara Method thoroughly and find out how to save money, time and crops by getting the right Niagara for his farm. Talk with your dealer or write us, and find out just what model Duster and what Dusts are best to use on Apples, Peaches, Pears, Potatoes, Hops, Grapes, Strawberries, Celery, Small Fruits, Vegetables, etc. Our specialists are at your service.

Mark and send the coupon today—get the booklets on protecting the crops you are interested in. Be posted on Dusting. It will save your crops and your money.

Orchard Planting

Please advise me in the near future as to planting trees. I have about ten acres of limestone soil nicely located for an orchard. It lies on the southeast side, at the foot of the mountain, is high and is surrounded with woods. What month should trees be planted? How far apart? Would you advise planting peaches between the apples so as to get sooner returns.—J. R. S., Juniata County, Pa.

At one time, about fifty years ago, Juniata was the leading county of the state in number of peach trees. The industry quickly perished from neglect. The foothills and ridges are well adapted for apple and peach growing. You have only a comparatively small local outlet for fruit, hence the orchard should be planted with the purpose of shipping. This means that the main body of planting should be winter apples.

Stayman, Grimes, York and Rome are good varieties, with perhaps a small proportion of earlier sorts, as Wealthy, Smokehouse, Summer Rambo and Jonathan. Local experience may convince you that other varieties are better than these.

The use of peaches as fillers in an apple orchard is satisfactory, provided several conditions are favorable: the site and soil must be favorable for peaches, as well as for apples, so that a crop of peaches may be expected at least two years out of three; the trees must be set far enough apart so that the peaches will not soon crowd the apples; the orchard must be given intensive cultivation; and the peaches must be pulled out promptly, say in about twelve years or whenever they seriously crowd the apples. At least seventy-five per cent of the peach planting should be Elberta.

Planting may be in April, or as early in the spring as the land is ready, the earlier the better. Set the apples forty feet apart each way, with peaches between to make an orchard twenty feet apart each way. Keep the peaches close-pruned. The peach tree in the center of the square of four apple trees may be left in longer than the others.—S. W. Fletcher.

Hard Specks on Apples

This year my Stark and Baldwin apples are covered with tiny hard specks. Can you tell me just what this disease is and what I can do to prevent it?—J. K., Beaver County, Pa.

Probably these apples are affected with the "Baldwin spot," or bitter-pit. This is not a fungous disease, and cannot be controlled by spraying. It is known as a "physiological disease"—that is, it is the result of malnutrition or unfavorable growth conditions.

Some varieties are more susceptible than others; the Baldwin is one of the worst.

The bitter-pit is most prevalent on fruit from young trees, and in off years, when the apples are few and large. It seems to be associated with rapid growth and an excess of moisture and nitrogen. It also develops on apples after they are placed in common storage.

There is no remedy and no preventative except in the selection of varieties and cultural practices that promote moderate growth.—S. W. F.

Deer-Proof Fence

THOSE who are thinking of building a deer-proof fence to protect their orchards from destruction by the state's livestock, will be interested in the following experience of H. T. Meyer, of Lewisburg. The orchard is at Rebersburg, Centre County. The state pays for the wire, the farmer pays the rest.

Deer-proof fence around the orchard of Henry T. Meyer, Centre County, Pa.

"I have gone over my final figures covering the total cost of constructing 300 rods of deer fence. You may be interested in the tabulation. I think this array of figures will closely approximate actual field conditions met with by most growers who construct this type of fence built according to specifications set by the State Board of Game Commissioners.

Labor at 25c per hour......	$627.50
Hauling posts and wire....	17.00
Stay wire for bracing posts.	11.00
Construction of two large gates, labor and material.	10.64
Total cost for 300 rods.	$666.14
Cost per rod	$ 2.22

One item for labor amounting to $25 is not listed in the figures given above. This item covered clearing fence rows of brush so that we could handle the wire easily. This figure is high and I think actual field conditions generally would not require so much expenditure, therefore, I have not listed it.

The posts, which I had on my own woodland, cost four cents per post. If you will allow me forty cents a post then the post bill would amount to $108 more than my four-cent cost, which is listed as labor and hauling. Correct bookkeeping would list my posts at $12 but since it was paid in terms of labor and team hire I did not list it as a separate item.

The above snapshot gives you a close up idea of the appearance of this fence, eight feet high and the posts from three and one-half to four feet deep."—S. W. Fletcher.

Ward's Free Catalogue Places This Big Baltimore House At Your Service

Ward's Spring Catalogue is Ready!

Your copy is now ready for mailing! *We need only your name and address on the coupon below.*

Our big Baltimore House contains acres and acres of floor space filled with fresh new merchandise—ready for every Spring need.

So write for the Catalogue. Take advantage of the quick service and the big saving this convenient Baltimore House brings to your home.

Your Opportunity For True Cooperative Buying

Things bought by the dozen cost less than if bought one at a time. Everyone knows that. And buying in big quantities is exactly what makes possible your big Savings at Montgomery Ward & Co.

You buy anything you like from Ward's, one at a time. And you get the low prices, the saving secured through our buying in car load lots, in train load lots, the saving in price secured by contracting for the entire product of a factory!

For example, our 8,000,000 customers bought so many stoves from us that we contracted to take all the stoves one of the finest factories could make. The prices we secured were so low that now *your average saving on a Ward stove amounts to fifteen dollars!*

Here is true cooperative buying—an opportunity for you to join hands with all of our customers, cooperating with them in your buying to secure lower and still lower prices on almost everything you need to wear or to use.

Ward's Low Prices Made Without Sacrificing Quality

Lower-than-market prices always need to be explained. How is the low price made possible? Was anything taken out of quality? That is the question always to be answered.

Was anything taken out of the quality—*inside this shoe?* How much new live rubber in this tire—*and how much old rubber?*

Low prices, then, can be made by cutting quality. Low prices may not mean to you a saving—they may mean to you merely a *sacrifice in wearing quality.*

At Ward's "we never sacrifice quality to make a low price." Our low prices are secured through the tremendous buying power given us by our 8,000,000 customers.

$60,000,000 In Cash Was Used To Make These Low Prices

Our complete organization of buying experts visit every important market in America and Europe in their search for Standard quality goods at the lowest prices. And they pay cash because cash buys cheapest—always.

Sixty million dollars in cash was used in buying the goods back of this Catalogue, in buying the merchandise to fill the seven big plants that together constitute Montgomery Ward & Co.

These are the reasons back of our offering of standard quality goods at lower-than-market prices—at prices that offer you a saving of $50 each season if you send all your orders to Ward's.

Our 54-Year-Old Complete Guarantee

You always buy on approval at Ward's. We guarantee your complete satisfaction with everything you buy. "Your money back if you want it."

The Run-Down Apple Orchard

Nitrogenous Fertilizers Bring Trees Into Bearing

THAT old run-down apple orchards can be brought back to profitable bearing by cultivation and by the use of nitrogenous fertilizers, has been demonstrated by the West Virginia Agricultural Experiment Station. Experiments covering a period of nine years are reported in Bulletin 174 of this station.

Apple orchards of different ages and in different stages of cultivation were tested for the effects of some of our common fertilizers. The most important findings were that old neglected trees made a greater response to fertilizers than did young bearing trees in good growing condition, and that nitrogenous fertilizers gave a more profitable response than did phosphoric acid or potash.

A twenty-year-old orchard of Rome, on a very poor silt loam soil in Pleasants County, along the Ohio River, was selected in the spring of 1911 for the first test. The trees were on the verge of starvation, making only two or three inches of growth a year, and filled with dead branches. The orchard was pruned thoroly, sprayed, and placed under cultivation. A block of trees was set aside laid out in plots for different fertilizer treatments. Two plots received sulphate of potash and acid phosphate; two nitrate of soda and acid phosphate; two nitrate of soda and sulphate of potash; two received all three of these materials; and two were left as checks, untreated.

Treatment	Increase in trunk circumference—3 yrs. average per tree, inches	Average annual twig-growth (2 years) inches	Total yield of fruit —7 yrs. avge. per tree bus.
Nitrate of soda, acid phosphate and potash	3.21	8.55	43
Nitrate of soda and acid phosphate	3.31	8.31	51
Nitrate of soda and potash	2.67	7.81	36
Acid phosphate and potash	2.06	5.95	24
Check—No fertilizer	1.98	4.83	25

The treatments were repeated annually, except after the first year muriate of potash was used instead of the sulphate, and in 1916 and thereafter the potash applications were discontinued. The fertilizer was applied the first two weeks in May by scattering under the trees toward the ends of the branches. Cultivation was kept up, and a cover crop of cowpeas or of red clover was grown nearly every year.

Increase in trunk circumference, the terminal twig growth, and the yield of fruit were measured for the effect of the fertilizers. The averages for the periods in which the records were taken are given in the accompanying table.

These figures show that nitrate of soda was without question the most effective material. It gave the best results when in combination with acid phosphate, these two materials surpassing the mixture of all three in trunk growth and yield. Acid phosphate and potash without nitrate gave practically no benefit, both growth and yield being nearly the same as on the check plots.

Nitrate of Soda Effective

Contrary to the experience of some experiment stations, the yields correspond very closely with the trunk and twig growth. There seems to be no doubt of the effectiveness of nitrate of soda in promoting both growth and yields.

These results are interesting also in comparison with tests conducted on apple orchards under more favorable growing conditions in West Virginia. A seven-year test, begun with one-year-old Rome trees, and a six-year test begun on a nine-year block of Grimes, Ben Davis, and York Imperial, were conducted on a silt loam soil at Sleepy Creek, in Morgan County. The soil was of fairly good fertility, and the trees in good condition at the outset. On the young trees, nitrate of soda and acid phosphate were of some benefit, but the difference was not so striking as in the run-down orchard. Potash appeared to be wholly ineffective. A small increase was noted for the nitrogen treatments also in the case of the young bearing trees. The effects upon yield in both orchards were irregular and show no great benefit from the use of the fertilizers. In these two cases, apparently the orchards were not in great need of additional plant food. The soil was good, and the trees in satisfactory condition.

Another Test Begun in 1917

The effect of nitrogen was again strikingly shown in a new test on starved trees begun in 1917.

A block of young bearing apple trees on an extremely poor but cultivated gravelly silt loam soil at Sleepy Creek was selected to test the value of nitrogen in restoring vigor to greatly devitalized trees. Trees receiving one, two, three, four and six pounds of nitrate of soda each were compared with untreated trees. The effect of the nitrate was almost immediate. In ten days the treated trees took on a greener color and made a more vigorous foliage growth. They also retained their foliage longer in the fall.

In two years the trunk and the twig growth were as follows:

Treatment per tree	Increase in circumference 2 yrs., inches	Average annual twig growth inches
Check—No nitrate of soda	0.58	3.20
1 lb. Nitrate of soda	2.00	8.30
2 lbs. " " "	1.54	8.98
3 " " " "	3.00	10.68
4 " " " "	2.12	12.56
6 " " " "	4.25	15.76

These figures speak for themselves. In general, the growth was in proportion to the amount of nitrate used. Unfortunately, no records of yields were taken, as the investigators were unable to be on the ground at harvest time.

Concluding the Discussion

In view of these results, Prof. W. H. Alderman and Prof. H. L. Crane, the authors of the bulletin, recommend the use of nitrogenous fertilizers to restore run-down orchards. At the conclusion of their discussion they say:

"Yellowish, sickly looking trees in sod, or starved trees on worn out, even tho cultivated soil, should be treated with some quickly available form of nitrogen, such as nitrate of soda. A good application is two- and one-half pounds for a small tree or five pounds for a mature tree. It should be applied in the spring just as growth is starting.

"Acid phosphate will be of value in growing a better sod mulch, or cover crop, but its direct value to the tree is still in question.

"West Virginia soils are well supplied with potash and the orchardist can safely ignore this material.

"Orchard fertilization should not be considered, except in conjunction with other orchard practices such as culture, spraying and pruning. All such factors directly affect the welfare of the orchard and thus influence the nutrition of the trees."—Carl R. Woodward.

The ten inch "catacomb" that holds all the non-moving parts of the "Super-Het," sealed airtight in a solid compound, so that time and moisture cannot affect them. (below).

Radiola 25, Super-Heterodyne with six Radiotrons . . . $165

Twenty feet of radio
in a ten inch box—
tuned with a single control!

RCA has gradually brought radio to greater performance, and greater simplicity. The first Super-Heterodyne that Armstrong built was twenty feet long. Now a little catacomb ten inches long conceals all its delicate parts. And a single movement of one finger gives accurate, sensitive tuning—selective beyond the possibilities of any twenty feet of mechanism in the old days.

A new Super-Heterodyne!

Now all the outside wires and connections are gone, and you have the new Super-Heterodyne—Radiola 25. It tunes in with a single control! It has a new power tube for *volume* on dry batteries. It has a fine mahogany finished cabinet to hold all those batteries. And yet its price is very moderate.

And another new Radiola

Another Radiola particularly suited to the farm—an antenna set of big performance—is Radiola 20. Uni-controlled—but with extra refinements for delicate tuning. With the new power Radiotron for full volume. With clear tone—distance power—reality! It is far in advance of any five tube set you have heard.

Radiola 20, with five Radiotrons $115
This is a tuned radio frequency receiver with tickler-governed regeneration.

A proof of quality

A *Radiola*—of any model—is always the safe buy in radio. It has behind it all the research resources—all the skill—of RCA, of General Electric, and of Westinghouse.

And with a Radiola in your living room, you will have entertainment—news—the world's finest music—all the long winter, regardless of wind or rain, snow or ice.

POULTRY

R. G. KIRBY
Staff Contributor and Adviser
Kirby Poultry Farm

Rooster with Growth

I have a White Rock rooster about eight and one-half months old, apparently in good condition. Eats well and looks fine but has a bunch on his breast. It is about the size of a small hen egg; sort of a reddish color, is a little hard, has no discharge and isn't sore. Please tell me how it can be removed.—Mrs. H. T., Washington County, Pa.

The bunch may be due to an abscess caused by an infected wound. If it seems soft it might be lanced and drained and the wound washed with iodine or commercial disinfectant. Birds are subject to tumors of various kinds. The removal of such a growth is work for a veterinarian. Unless the bird is valuable for breeding purposes the expense of such an operation is greater than its value.—R. G. Kirby.

Hens Need Mash

One of the things I would like to know is what to do when a flock will or does consume too much laying mash? I have thirty-five Barred Rocks, three are cockerels, ten are yearlings, and balance of flock are pullets. They have eaten 100 pounds of laying mash in two weeks and I think that is rather too much. I feed four quarts scratch in litter, one-half morning and evening. At noon I cook turnips or potatoes and mix bran with it while hot to make a moist mash and about once in three or four days in place of potatoes use green meat scraps. I also have an oats sprouter and feed sprouted oats every day. They are inclined to egg eating. I tried the ammonia cure with little success. Can you suggest a remedy for that? I occasionally give salts in drinking water. Last month the hens laid well, averaging about fourteen eggs per day, this week they began falling off. What do you think is wrong now? I think they may be too fat.—C. W. Y., Lawrence County, Pa.

Most poultrymen try to feed equal parts of laying mash and scratch grain and the only difficulty is to make them eat enough mash. Most hens seem to have more appetite for grain than they have for mash. I do not think your hens can eat too much mash if they have a normal ration of scratch grain and are of good bodily weight.

Plenty of Feed Necessary

The fact that they eat plenty of mash proves they are good feeders and apt to be good layers. Hens cannot lay in the winter unless they eat plenty of feed. You are lucky to have birds that eat plenty of mash.

Egg eating can usually be prevented by feeding a balanced ration, oyster shells and a little bone meal. Use darkened nests and gather the eggs often. When hens scratch in open nests containing very little straw the eggs are easily broken and this starts the egg eating habit. Hens may be too fat to lay. One of the best ways to reduce them is to cut down the grain ration and make them eat more mash. The little grain that is given them should be thrown in deep litter to induce exercise.—R. G. Kirby.

Poultry Course a Success

ONE hundred poultrymen, specialists, students, and visitors took part in the meetings of the fifth annual Pennsylvania State College Poultry Short Course which ran from February 1 to 12th. It was the most successful short course ever held at State College.

More than twenty thousand birds were represented by the flock owners and managers in attendance. The largest flocks were those of Guy Leader, York County, 3000 birds; G. H. Hocker, Wayne County, 2000; William T. Cope, Chester County, 2000; A. L. Marsh, Torrance, 1450; Herbert Hartman, Ohio, 1400; H. C. McCullough, Westmoreland County, 1400; Samuel Heisey, Clinton County, 1400; Floyd N. Wiltshire, Allegheny County, 1100, and M. C. Crone, York County, 1000 birds.

Good Rations for Chicks

THE cost of feeding large flocks of chicks can often be reduced by working home-grown grains into properly balanced mixtures. If only a few chicks are raised and there is no time for making good chick mashes, it is better to buy them ready made. Many poultrymen who make their own laying mashes depend on the commercial mashes for their chicks.

But if you wish to make good chick mashes, some of these formulae will prove very good. I like the Cornell mash when the ground oats are left out and the corn meal is increased. A mixture of 35 lbs. yellow corn meal, 20 lbs. bran, 20 lbs. middlings, 10 lbs. meat scrap, 10 lbs. dried buttermilk, 5 lbs. bone meal and ½ lb. salt will give good results.

Yellow Corn Meal in Mashes

The use of yellow corn meal in chick mashes seems to help in giving the young birds plump, heavy bodies. It used to be an old standby on the farm years ago and as I remember the situation there were a lot of fine husky chickens produced altho heavy egg production was not the rule.

One farmer in our section reports good results from a chick mash consisting of 300 lbs. bran, 200 lbs. middlings, 200 lbs. ground corn, 100 lbs. oatmeal, 50 lbs. meat scrap, 25 lbs. raw bone meal and 25 lbs. of charcoal.

Raw Sunshine, Too

At the Wisconsin station they have used a chick starter composed of 80 parts yellow corn meal, 20 parts middlings, 5 parts raw bone, 5 parts calcium carbonate and 1 part fine salt. The chicks are given skimmilk to drink but no water.

Plenty of pure raw sunshine seems essential to the best results with this ration, but then this is true of all rations. Chicks need sunshine which is not filtered thru glass. The use of glass substitutes and cod liver oil will receive more attention than ever in the production of vigorous late winter chicks.—R. G. Kirby.

Causes of Bumble Foot

SOMETIMES when a hen becomes lame an examination of the foot locates a swelling where an abscess has gathered. This swelling should be lanced with a wide cut and the accumulation of hard matter picked out. Then wash the wound with iodine or commercial disinfectant and isolate the bird on clean straw. It may be necessary to cleanse the wound several times before it heals.

Poultry surgery takes time and should be largely avoided by preventive measures. I once visited a flock of Leghorns in which bumble foot was becoming very prevalent during the winter. They had been fed corn on the cob all winter until the accumulation of corn cobs made up most of the litter and covered the small amount of straw on the floor. Heaps of corn cobs were on the floor where the birds jumped down from the roosts. I concluded that jumping down on the rough, dry corn cobs was bruising the birds' feet and causing the formation of the abscesses. The cobs were raked out and straw thrown in the house and the condition improved. The next year thru feeding shelled grain in deep litter this poultryman had no trouble with bumble foot.

Briers and Sharp Stones

An abscess in the foot can also be caused by wounds from briers or sharp stones. Leghorns do not seem to have as much trouble with bumble foot as the heavier breeds. The light weight birds can even carry a small abscess between the toes and not even show lameness.

With all breeds it is best to let such wounds localize before making a cut in the foot and then be careful to keep the wound as clean as possible. The livestock farmer can call the veterinarian but because of the small value of individual birds, most poultrymen have to be their own veterinarians.—R. G. Kirby.

Healthy Breeding Birds

MY EXPERIENCE producing hatching eggs is that we should endeavor to feed our fowls so as to retain their good health, for I find that it is very important that fowls producing hatching eggs should be in the pink of condition all the while.

What we mean is this, that while we might slightly overstimulate the hens when striving to get all possible eggs from them and then put them on the market, such overstimulation would be detrimental to the production of good strong chicks.

The care of breeding birds should be such as to enable the hen to perform her duty of reproduction in the most complete manner. She should be so cared for as to produce good sized well fertilized eggs, that will hatch strong, vigorous chicks; that will live and thrive and grow to be full sized.

There is one thing which must be well considered or disaster will surely follow. A breeding pen should be made up of strong, vigorous fowls, well mated and then one can be almost sure of satisfactory results.

Give them all the good dry mash they will consume, together with an abundant supply of green matter. Then just enough grain each day to make a balanced ration. Let their water supply be of the best and purest. Sometimes the male bird of the breeding yard is so officious to his mates at feeding time that he does not get his share of feed and will eventually run down and not be a good strong breeder.

This can be obviated by placing a small tin can on the top of a stake in which keep some corn that he can eat at will. Make it just high enough so the hens cannot reach into it but not too high for him.—Chas. authers, Juniata County, Pa.

Superior Corn Planter

THE Superior Corn Planter is built to do a hard job supremely well. It is simple, strong, easily operated—and like all Superior implements can be depended upon for utmost accuracy and precision in planting. The use of this highest-quality implement not only means a bigger, better crop, but far greater ease in cultivating. Straight, even rows of uniform heighth are a certainty—and there are no skips or misses. Every square foot of ground bears its sturdy plants—insuring full profits for you.

The Superior Corn Planter has row adjustments of from 28 inches to 40 inches—with 2 inch spacings. Double marker. Can be instantly adjusted for drilling. Fertilizer attachment easily added at any time. No springs or complicated parts. No feed rod clutches to get out of order. Has center lever, center reel and strong channel steel frame.

Buckeye Cultivators

Cultivating with a Buckeye is the direct route to better crops and bigger profits. Buckeye cultivation means easier work and best possible results—always. These highest-quality implements are remarkable for simplicity of operation, lightness of draft, balance and flexibility. Sturdily built of finest materials, they insure long years of dependable service.

The Buckeye line is unusually complete. It includes both Riding and Walking Cultivators, One and Two-Row—and horse and tractor drawn machines.

The Black Hawk Spreader

The Black Hawk Manure Spreader is truly a Superior product. Made in the same factory that produces the famous Superior Grain Drill and other quality implements.

The Black Hawk does not merely unload manure or dump it on the hit-and-miss plan—it thoroughly shreds and pulverizes it and spreads it widely and evenly, literally carpeting the ground in any quantity desired. A two-horse spreader. Does perfect work on both hillsides and level ground.

See the complete line of Superior farm implements at your dealer's—or check and mail coupon for circular and full details.

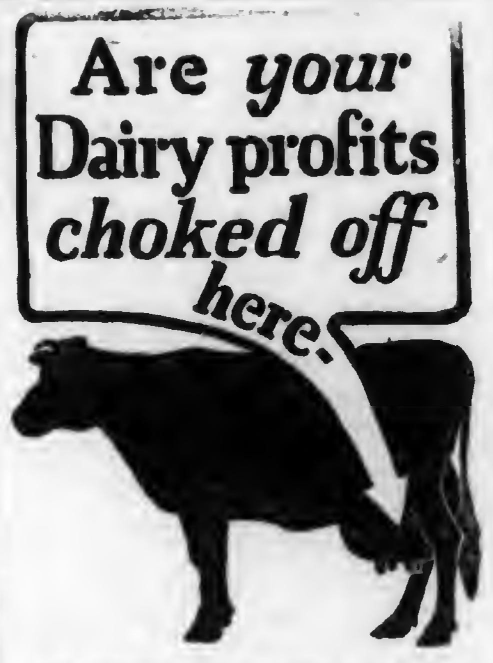
Norwich, N. Y.

CRASCO STEEL RODDED SILOS



How foolish to spend good money and effort to get a good flow of milk into the udder—only to have it held back due to some nagging discomfort of the all-important milk-giving organ! Milk thus held back is absorbed by the system—completely lost. Even worse, the cow is likely to form the habit of holding back the milk if the cause is not quickly removed.

The slightest hurt of the udder or teats needs your quick attention. You can keep these delicate tissues soft, pliable, productive by using Bag Balm always at the first sign of trouble. For sore teats, chaps, cuts teats cracked or stepped-on Bag Balm is a quick, cleansing healer. Fine for caked bag, bunches, cow pox, etc. This wonderful ointment quickly penetrates, heals, restores. It is pleasant to use and will not taint the milk. Has scores of uses on the farm for treating any animal sore or skin trouble.

Bag Balm in the big 10-ounce package for 60c, is carried by feed dealers, general stores, druggists. Order direct from us if you have difficulty getting it.

Butter Prices on the Philadelphia Market

THE chart on this page offers a graphic comparison of average monthly prices on 92 score butter during the past two years illustrating many interesting points. Altho price fluctuations within any given month are not pictured, the monthly average is sufficient for comparative purposes. The chart is based on statistics issued by the United States Bureau of Agricultural Economics.

The year 1924 shows an average price for the twelve months period of a fraction over 43 cents. Only during the four months of January, February, March and December did the average exceed the yearly average. Due to light receipts of fresh butter and a limited supply of storage stock, the early months of 1924 saw a relatively high price level. Heavy importations of Danish, New Zealand, Argentine and Siberian butter, along with free offerings for further shipment, forced the market thru a 14-cent decline in successive stages until a 39-cent level was reached for April.

An Unusual Season

A wet spring, which delayed production somewhat, resulted in considerable competition for available supplies for storage during June and July and set the price at a high level for the season. Production picked up rapidly in late July and August due to a complete reversal of weather conditions. Heavy receipts at terminal markets forced prices down to low levels with a very unsatisfactory market.

Shorter supplies in November and December aided in a fair advance but at no time was a profit obtainable on butter stored when carrying charges were added.

The year of 1925 was a more favorable year in so far as the price level was concerned. The yearly average was a little over 46 cents with the price ruling higher than 46 cents during six of the twelve months.

A sharp upturn during March was caused by the exceptionally heavy storage stocks having been depleted by very good consumption due to low price levels. The result was that before the seasonal spring increase made supplies more plentiful all markets suffered a scarcity of butter.

Production during 1925 was lighter than 1924 because of the fact that prices for the previous year were discouraging enough to put many producers out of the business. As a result receipts at the terminal markets were not so heavy and storage holdings were a great deal lighter with a natural tendency to support the price level.—W. R. Whitacre.

Preventing Calf Scours

THE old method of preventing calf scours by removing the cow due to calve to a barn or shed unused for a long time by dairy animals can now be superseded by a better method.

Altho the old isolation method cuts down losses greatly, it is not so effective as the colostrum milk method discovered by Doctor Little of the Rockefeller Institute. As soon as the calf is dropped, one or two eight-ounce bottles of the dam's milk should be drawn and given to the calf. This feeding is best done by using regular nursing bottle and enlarging the holes in the nipples.

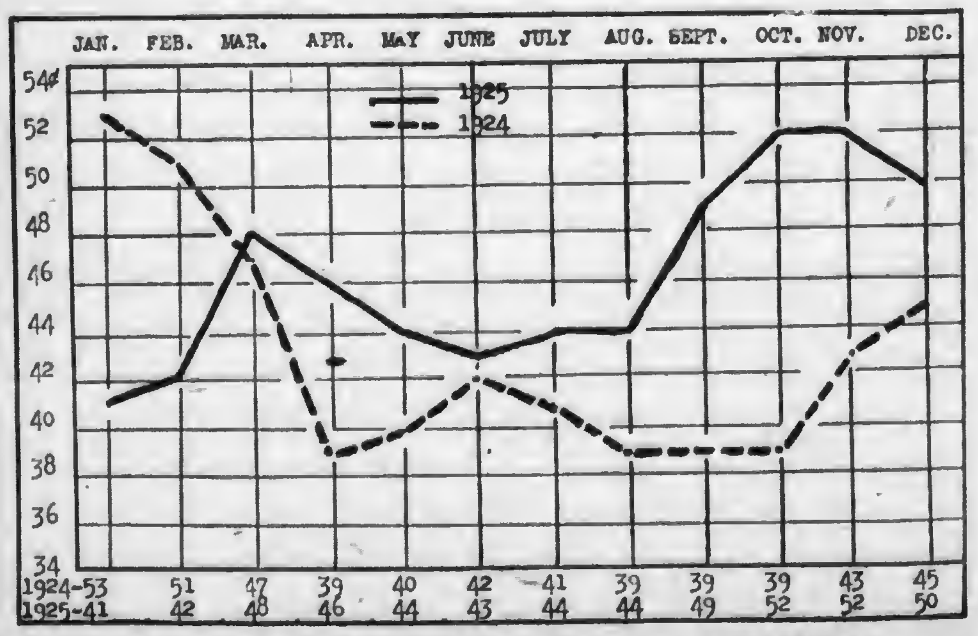
This first milk or colostrum of the cow possesses a number of qualities highly essential to the new born calf.

Even if there is no evidence of scours in the herd it is well to feed colostrum milk to all of the calves at birth before they have a chance to suckle their dam. To be effective the colostrum must reach the calf's stomach before any filth can get there. The nursing bottles and nipples should be thoroly cleaned and disinfected immediately before using.—Carl B. Bender, N. J. College of Agriculture.

Results of Dairy Tests

THIRTY-TWO Pennsylvania cow testing associations tested 11,485 cows during the month of December. Of this number 1324 produced 40 or more pounds of butterfat and 1533 topped the 1000-pound mark in milk production. In the 40-pound group, 460 produced 50 or more pounds of butterfat.

The Carbon-Lehigh Association had the highest number of 40-pound cows, 94, and the largest number of 1000-pounders, 140. The highest 10-cow average in butterfat production, 79.1 pounds, also was credited to this test group. L. A. Zimmerman, of the Carbon-Lehigh Association, made the highest milk record, 2821 pounds, and the best fat figure, 103 pounds, with a registered Holstein in each case. In number of cows tested the Central Pennsylvania Guernsey Breeders' Association, of Blair County, led with 567.



Monthly average price 92 score butter at Philadelphia.

Massey-Harris

Pivot-Axle Corn Cultivator

WITH this Machine you can easily follow crooked rows or hold the gangs in place on steep hillsides. The wheels are instantly steered by foot levers or they can be locked into permanent position.

Easy adjustments permit this Cultivator to be used in rows of varying widths, 28 inches and up. The gangs keep all the shovels working at even depth and can be adjusted wide or close as desired.

Team is relieved of all neckweight by shifting convenient balance lever. A single master lever raises both gangs or applies pressure when needed.

Built in three sizes, equipped with spring-trip or pin-break gangs. Can be fitted with Rotary Shields, Special Shovels and Disc Hillers.

See it at the Massey-Harris dealer during "Better Farm Equipment Week," March 15-20.

Where York Buys

RAILROAD records show that receipts of all fruits and vegetables at York, Pa., during 1925, decreased 34 per cent from 609 cars in 1924 to 394 cars in 1925, according to the Pennsylvania Bureau of Markets.

While 15 different commodities were included in the receipts, the smaller quantity resulted chiefly from a reduction of almost 50 per cent in the number of cars of mixed produce received from Baltimore. The actual number in 1924 was 256 as compared with 135 last year, and this decrease can probably be attributed largely to the increased use of the motor truck.

Because of the abundance of local potatoes last fall, unloads of this commodity were cut in half, amounting to only 21 cars during the entire year. All of the 11 cars of apples received came from Pennsylvania shipping points.

Cantaloupes, grapes, watermelons, cabbage, lettuce and peaches showed declines from the preceding year, but largely during the season when local products were available.

The total carlot receipts of fruits and vegetables in York during 1925 are as follows: mixed produce, 135 cars; bananas, 121; watermelons, 42; oranges, 22; potatoes, 21; peaches, 17; apples, 11; cabbage, 6; grapefruit, 4; sweet potatoes, 3; cantaloupes, 3; celery, 3; pineapples, 2; lemons, 2; tangerines, 1, and grapes 1.

At Easton-Phillipsburg

FIGURES compiled by the Pennsylvania Bureau of Markets show that 621 cars of fruits and vegetables in Easton and Phillipsburg were loaded in 1925 as compared with 567 cars in 1924.

Bananas show the largest increase, 70 per cent, jumping from 120 cars in 1924 to 201 cars last year. Mixed produce cars from Philadelphia show the next largest quantity, jumping from 111 cars to 158 cars, an increase of 30 per cent.

The receipts of apples were 25 cars last year as compared to 21 cars in 1924. Potato receipts dropped from 89 to 51 cars. Practically all this decrease occurred during the season between the first of June and the first of September, when the supply from Virginia and Maryland was not so plentiful as during the same period in 1924. The steady decrease in New Jersey supplies apparent again in 1925, shows the increasing use of the motor truck in supplying potatoes within trucking distance of Easton. Twelve cars in all represented the late potatoes, about half of which were for seed purposes.

Total carlot receipts of fruits and vegetables into Easton-Phillipsburg during 1925 are as follows: bananas, 201; mixed produce, 158; watermelons, 60; potatoes, 51; peaches, 28; apples, 25; cantaloupes, 24; grapes, 22; celery, 22; strawberries, 9; cabbage, 9; sweet potatoes, 8; oranges, 2, and onions, 2.

A Flying Trip

(Continued from page 3)

have been sold if they had been available.

Range men tried to contract for next year's supply of bulls, but they were not successful, as breeders are confident that higher prices will prevail next year. The feeling among the western livestock men is that there will be a greater sale of breeding cattle in all parts of the country during the next year.

From the standpoint of scenery the Middle West cannot be compared with the East. With the exception of the mountains near Denver there was little variation in the landscape for hundreds of miles, but the trip was interesting and increased ones appreciation of the varied agriculture of the United States.

When you fence fence for your boys too!

WHEN you fence, put up Leadclad. Then you will have a fence that will not only serve you, but will serve your boys too, for years to come.

LEADCLAD Fence is just what the name says—protected against rust by a **jacket of pure lead.** The pure lead jacket is heavy too, seven times heavier than the zinc coating on ordinary fence. The little sketch shown at the side illustrates how you can peel long shavings of lead off with your knife and still not get down to the steel wire. The lead jacket is tough, you can hammer Leadclad wire till it is flat, yet you cannot crack or chip off the lead.

Thousands of farms are permanently protected with Leadclad fence. Thousands of farmers know how it stands wear and weather and how much actual money Leadclad is saving them. They don't have the trouble and expense of replacing rusty fence every few years.

Leadclad is made in all styles for farm use, poultry and lawn. Our big catalogue carries full descriptions.

Factory to you prices and we pay the freight.

Get the facts about Leadclad for yourself. Send the coupon for prices, samples and our special 5% club offer.

LEADCLAD WIRE CO.

"Scoot, for the love o' Mike!"

is the wail of the crows when once they light on a corn-field where the seed-corn has been coated with Stanley's Crow Repellent. One taste is enough. And every crow, every squirrel, every mole, every gopher, every pest of any kind, keeps off that field. It doesn't kill them, for it isn't poisonous, but it's worse than any other "white mule" in all crow-dom. And your crow worries are over. You won't have to replant hill after hill. Much of your valuable time is saved, besides all the extra cost of seed-corn to replant with. And for every $1.00 you spend for

Stanley's Crow Repellent

you will reap from 20 to 40 more bushels of corn at harvest time. It's easy to use—simply mix it with your seed-corn. You don't have to wait for it even to dry. And it never clogs the planter. If you have any doubts as to what Stanley's Crow Repellent will do for you, ask us to send you copies of hundreds of letters we have received and every one of these testimonials unsolicited. Large can, enough for 2 bu. of seed-corn (8 to 10 acres), $1.50. Half size can, $1.00. If your hardware, drug or seed store doesn't have it in stock, then order direct. "Money Back" guarantee. Speed Up Work–Reduce Labor–and Increase Your Profits this Year– with the

CENTAUR TRACTOR

NEVER before has any farm tractor—regardless of price—offered such an abundance of practical, profit-earning features! Never before have you had an opportunity to buy a power unit that would do—*at such small cost*—the things that CENTAUR does! At a cost of a few cents per hour it will cultivate a 9 acre field—in one day. It will pull a 12" plow, heavy harrow, seeder and other field implements. And it is just right for belt jobs. In brief, the CENTAUR is the tractor that you have always looked for—a small size, full-powered unit that will handle your farm work *easily and economically.*

For Large and Small Farms

If you own a small farm—5 to 50 acres—the CENTAUR will take care of all your power work—*better, quicker and cheaper than horses*—and far more comfortably, because you *ride* instead of walk. With the CENTAUR there is no more trudging thru heavy mud when plowing or doing other field work.

You slip into the spring seat, shift the gears and do all of your work easily, quickly, comfortably. For large farms the CENTAUR is invaluable as a secondary power unit. It is ideal for cultivating—and for all general utility work.

Six Years of Success

The CENTAUR isn't new and untried. Six years of remarkably satisfactory service on thousands of farms have proved it to be right in every detail. No matter what size farm you own, the CENTAUR has a definite service to render you. It is the one tractor that solves your problem of getting farm work done easily and quickly—at bed-rock cost—and on time!

Write at Once for Full Particulars

Right now is the time to get your CENTAUR. Spring plowing is just ahead of you. And then come more months of heavy work. Let us prove to you how the CENTAUR will more than pay for itself in saving your time and labor on all of these jobs. A letter or post card will bring you all the facts. Write at once.

Write Gilson Mfg. Co., 504 Park St. Port Washington Wis

PAPEC

"The Cutter That Does Not Clog"

THE light-running Papec is just the Cutter for home and neighborhood filling. It requires less help and less power than any other cutter of equal capacity.

The entire feeding mechanism is now so nearly human in action that a man is no longer needed at the feeding table. Given suitable power, the Papec never clogs under *any* load or *any* silo.

Simple, rugged construction assures long life with few repairs. Many are giving good service after ten years' heavy use. Every part is easy to get at and adjust. There are no worries and no delays when you get a Papec on the job. Built by men who have specialized in Papec construction for 25 years.

Our 1926 Catalog describes four sizes of Papec Cutters and shows how a Papec will pay for itself in one or two seasons. Write for your copy today.

"Your Neighbor Has One – Ask Him"

W. H. TOMHAVE
Staff Contributor and Adviser
Head of the Department of Animal Husbandry, Pennsylvania State College

When to Dip Sheep

We have a flock of sheep that are due to lamb early in April. These ewes are badly infested with ticks. Would you advise us to dip these sheep now while they have the wool on or should we wait until later in the spring?—W. C. D., Blair County, Pa.

I would not consider it a desirable nor safe practice to dip these ewes at this time of the year. The loss thru dipping during cold weather would be greater than any loss because of ticks. Ewes dipped during February or March are likely to come down with pneumonia and die. It will be much better to wait until after the lambs have been dropped and the ewes sheared. After the ewes have been shorn both lambs and ewes should be dipped.

I would suggest the use of any of the standard sheep dips. They should be prepared according to the directions given on the container. It will probably be desirable to dip the sheep and lambs twice at intervals of ten to twelve days. By following this practice and dipping all ewes and lambs the tick can be pretty well cleaned up.

It will be a good practice to dip all the sheep that are to be carried thru the winter at some time early in the fall before cold weather sets in. This practice will reduce the trouble from ticks during the winter months.—W. H. Tomhave.

Buying Breeding Ewes

Could you give me the approximate price of a carload of two-year-old ewes suitable for breeding next fall and the best place for me to get them? About how much leguminous hay would be needed a month to feed a flock of this size?—P. T. W., Clinton County, Pa.

It is a difficult matter to predict just what price you will have to pay for a carload of two-year-old breeding ewes next fall without more information about the type of ewes wanted. There are two types of ewes available that might be purchased to advantage for commercial lamb production. These are grade western ewes or grade Merino ewes. With the present price of breeding sheep these ewes will probably cost from $10.00 to $12.00 per head, depending upon the quality.

The fine wool Merino ewes can be secured to best advantage in southwestern Pennsylvania, northern West Virginia or southeastern Ohio. There are several ways of getting in touch with men who might have sheep of this kind for sale. During the spring and summer months sheep men frequently advertise in the agricultural publications. The sheep extension specialists at the Pennsylvania State College, State College, Pennsylvania; West Virginia University, Morgantown, West Virginia, and Ohio State University, Columbus, Ohio, can give you a list of men who can supply you.

The grade western ewes can best be purchased on one of the central western markets, such as Chicago, Kansas City or Denver or direct from western range men. The names of reliable commission men operating on these markets can be secured by writing the livestock exchange on each of these markets. The names of western range men can be secured from sheep journals or by writing your sheep extension specialist at the college.

Either of the two types described will provide a good foundation for producing market lambs. They must, however, be bred to a purebred ram of one of the mutton breed.

It takes about 125 head of average ewes to make a single deck. This is enough sheep to start with, especially if you have had very little experience with sheep.

The amount of legume hay that will be consumed per month will depend somewhat upon the amount of other feed such as grain and silage that will be fed. The ewes will consume from three to five pounds of hay daily. Assuming that they will average four pounds daily it will require between seven and eight tons of hay per month to supply a flock of 125 ewes.—W. H. Tomhave.

Rations for Idle Horses

TWO good daily rations for idle horses, per 1000 pounds of live weight, would be: Corn stover, 9 lbs., and clover or alfalfa hay, 8 lbs.; or else oat straw, 6 lbs., clover or alfalfa hay, 10 lbs., and corn, 1 lb. By feeding these cheap roughages with a small amount of protein feeds, such as linseed oil meal and wheat bran, the horses can be easily maintained at a minimum expense.

When the horses go into the hard work of the spring they will not be able to use as much roughage as when they are idle because they have not the time needed to thoroly chew and digest it. For this reason the roughage should be reduced and the grain concentrates increased as soon as they begin to work. This should be done gradually so as not to cause colic or other digestive troubles.—W. C. Skelley, New Jersey Agricultural Experiment Station.

Do Pigs Pay in Winter?

AT PRESENT I am feeding seventy fall pigs (Feb. 10) and have them in the basement of the barn where it is not cold and they do exceptionally well. They average about 100 pounds live weight. I had ten of them in the pig sty where it got cold and they did not thrive until I put them in the barn with the others.

It pays to make the pigs comfortable and it does not pay to feed pigs in winter unless they are kept comfortable. I am feeding them corn, middlings, tankage, a little skim-milk, cooked butcher scrap, a head of cabbage occasionally, and soy bean hay. You ought to see them grow. Everybody admires them and most people attribute my success to the good blood but I attribute my success to the treatment and feed.—C. R. Bashore, Berks County, Pa.

New Litter Club Started

INQUIRIES from farmers relative to the 1926 Keystone ton litter contest indicate that the popularity of this work will continue during the coming year. According to L. C. Madison, animal husbandry extension specialist at the Pennsylvania State College, litters farrowed on or after February 1 can be enrolled in the 1926 Ton Litter Club. Copies of the 1926 project and enrollment cards may be secured from the county agent. In 1925, Pennsylvania tied for first place in number of ton litters and breeders are out to better this record in 1926.—A. L. B.

Importance of Farm Records

They Will Place Farming on a Businesslike Basis

Many farmers have found that a desk is a very worth while piece of furniture in the home.

FARMING is, or should be, a modern, up-to-date business and should be conducted accordingly. That means that records of various kinds must be kept as well as the stock and breeding records, which most of us keep.

Duplicate copies of business correspondence are kept by most well-conducted businesses. Farmers should do the same thing. And here is where a typewriter becomes serviceable. A few years ago I purchased one to use in our farm business. I was the only farmer in the community that had one at that time; today I know of several near-by farmers who have them in their homes. With a typewriter, one can use a carbon sheet and thus at one writing secure a duplicate copy of out-going correspondence for his own records.

For filing correspondence we use the common book-shaped files which cost about twenty-five cents. They are provided with an alphabetical index. Our letters, or duplicate copies of our letters to another party, are fastened with a clip to the letters we receive from this party. Thus when we look in the file under the proper index and find that party's name, we lift out a sheaf of correspondence containing a complete record of all our communications.

Receipts and canceled checks also should be preserved for future records. A few years ago we had a difference with a party concerning the payment of rent. It wasn't settled until we dug up our canceled check.

Sometime ago in digging a ditch across a field to drain a low place, we discovered that another ditch had been laid almost to the wet spot some years before. It was on a piece of land we had recently purchased. Accordingly, we proceeded to find out about the ditches on this farm. Had we done this first, it would have saved us a lot of labor and many tile.

A Valuable Map of the Farm

It occurred to me then that there were many ditches on our old farm that father knew of but which I could not place—they having been put in before my time. I therefore made a map of the farm showing all the fields, etc. On this map was shown all the known tile drains, the size of the tile, etc. As new drains are put in, they are added to the map. Thus when father is no longer here to inform me about the old ditches, my record will show me where they are. I don't know if this sort of record is kept by many farmers or not, but it is a capital idea.

Of late years we have come to keeping another set of records also—rather it is a sort of annual statement, a summarizing of our capital invested in the several branches of our farming business. We have figured as accurately as possible the amount of money we have invested in: land, fences, buildings, tile drains, standing timber, machinery, livestock, etc. Each year we like to compare these statements and see what alterations we have been able to make.

Have Reduced Investment in Fences

For instance, a few years ago our farm was cut up into many small fields. Our investment then in fences was around $1100. Today our fields are larger and our investment in fences is around $600. Our tendency now is to reduce our investment in fences and increase it in drainage.

Another example: A few years ago we had thirty acres in standing timber. We learned that land worth more than $30 an acre can not be used profitably for growing timber—that is the figure given us by one of our state agricultural specialists. Our land at that time was worth at least $150 an acre. That meant that we had an investment of $4500 in land and at least $2000 in timber, or a total investment of $6500 on which we were paying taxes and from which we were getting very little revenue. Today we have reduced it to ten acres of timber (and expect to cut that off soon), with an investment of around $2000. In other words, we have changed that $4500 investment from a relatively non-productive to a productive investment. The twenty acres are now producing valuable crops, while the timber money ($1500) is bringing us annual interest.

I know some farmers who have small house safes in which they keep their valuable papers and records. We have never resorted to one of these, tho we do rent a deposit box at our local bank where we keep such papers as notes, certificates, unregistered bonds, etc.

A desk in the farm home facilitates the handling and keeping of farm records. Quite a number of up-to-date farmers in our community now have business desks.—P. C. Grose.

The word "thief" was on the blackboard, but Dick could not spell it. "Surely you know what that spells," exclaimed the teacher. "Now, suppose I put my hand into your pocket and took out a penny, what should I be?" "A conjurer," replied Dick.—London Post.

"How CAN I know WHAT water system to install?"

"You don't have to worry about a fresh water pressure system. The sure, safe way is to put the responsibility on Duro."

Duro is the only large organization that *specializes exclusively in water systems and water softeners* for farm or residence use. Duro engineers will study your requirements thoroughly and make *unbiased recommendations.*

Old Furniture Made New

Good Substitutes if You Can't Have Real Antiques

REAL antiques are out of the question for most of us, because they are exceedingly scarce and their prices are often exorbitant. But we can appreciate the merely old furniture of good design, and can often procure pieces at a very slight cost. Rickety furniture is not usually a good investment, but sometimes good glue, firm tying, and a little time will work wonders with an unsteady chair or table and an old piece of furniture that is made of good wood and has pleasing lines, will nearly always turn out to be a satisfaction to the one who salvages it.

The small chest of drawers shown in an accompanying picture was nearly black when first seen in a neighbor's basement. I looked inside the drawers and being sure it was walnut, offered her three dollars for it. She was amazed at my offer and made haste to remove the tools the chest contained before I would take back my rash words.

Painted pieces—formerly a washstand and a chair in the woodpile.

Varnish remover was used and almost quarts of heavy, dark varnish scraped off. When the original beautiful walnut had appeared the chest was sandpapered well, rubbed and waxed and is now a most prized possession.

Exceedingly Useful

These small chests are of course not as valuable as the large ones but are exceedingly useful, rather easy to find, and to my mind much more attractive than the small modern tables which are ordinarily placed in small wall spaces.

The large mirror pictured above the chest of drawers was once part of an old walnut dresser. The contour of these old mirrors taken from dressers is often very lovely. This one was found standing in the corner of an old storehouse, was bought for two dollars and we have never wished for a modern one in its place.

This armchair has an imitation rush seat. A small walnut chest with an old mirror above it.

The small stand and chair shown were of inferior wood so were worked out as painted pieces. The stand was an old washstand with protruding racks for towels, and the chair was a seatless affair that was rescued from the wood pile. The racks were sawed off the stand, it was sanded and given three coats of black paint. A seat was made for the chair by tacking webbing very tight across the opening, padding it with cotton and tacking over a piece of tapestry with small upholstery tacks close together.

To Get the Rubbed Effect

After a small conventional design had been painted with bright colored enamel on stand and chair, each was given a coat of dull finish varnish to protect the paint and to give the desired rubbed effect. This combination would make a good hall group or might be used as a telephone stand with chair. These old washstands also make useful bedside tables.

Since becoming interested in salvaging furniture, we have learned to make imitation rush seats. The chair beside the small spool table in the picture shows a finished one. The frame of the chair should be refinished before attempting the seat.

The imitation rush, which is really twisted paper is purchased in five or ten-pound rolls. The price is about seventy-five cents a pound or less if ten pounds or more are purchased. It is used wet and when the seat is dry, it is either shellaced or varnished.—Elsa S. Clark, Ill.

Game for Quilting Bee

AT YOUR next thimble party or quilting bee, try this interesting game during a welcome rest period. Write the Stitch Questions on slips of paper, leaving a space opposite each for the answer. Make a list for each guest. Pass the lists and pencils and let your friends attempt to write the correct stitch for each suggestion, giving them a time limit. When finished let them pass their own paper to the nearest neighbor on the left, and much merriment follows while they compare answers with those the hostess now announces.

1. What stitch is hard to live with?—Cross-stitch.
2. What stitch is found on fowls?—Feather-stitch.
3. What stitch is part of a cough?—Hem-stitch.
4. What stitch is made of many links?—Chain-stitch.
5. What stitch is part of a window?—Blind-stitch.
6. What stitch is neither bold nor forward?—Back-stitch.
7. What stitch is useless without a key?—Lock-stitch.
8. What stitch is never slow?—Run-stitch.
9. What stitch repeats itself?—Over and over-stitch.
10. What stitch is ever in one place?—Side-stitch.
11. What stitch is part of a horse's equipment?—Saddle-stitch.
12. What stitch is applied in roasting meats?—Basting-stitch.
13. What stitch is part of a fence?—Bar-stitch.
14. What stitch is found in the harness shop?—Whip-stitch.
15. What stitch is almost a wear ever?—Button-hole-stitch.
16. What stitch beautifies many dresses?—Embroidery-stitch.

An emery bag makes a good first prize, and a package of needles an appropriate booby.—Clarice Raymond.

Plants Call You Outdoors

THE time is here to send for seed to sow for the early plants every lover of nature so much wants. The raising of flower plants and beautiful blossoms is far from foolish. One farm woman, to pay for time spent in pleasure, sends for more flower seed than needed for her own supply. She raises fine plants, sells all she can and sets out all unsold plants, selling the cut flowers. For these she always has a demand much greater than she can supply.

The cutting off of all the most beautiful blooms necessitates sending for new seed every year to insure fine flowers. This woman raisea many kinds of flowers, but the large flowering long-stemmed aster is a specialty and always liked by any one who likes flowers at all. Thus many happy moments are spent among the flowers in the strenuous seasons that otherwise would be spent at the monotonous tasks that never end.

A change of work and mind is beneficial and indeed a boon to women who find some pleasant things to do each day. One an do more and better work after a short diversion with something beautiful out-of-doors in Nature's workshop.—Arabelle Smith.

Mrs. Harrington's Work

YOU will all rejoice to have greetings from Mrs. Harrington, and learn how happy she is in her inspiring work. This week she took time to send love to all of Our Family, thru Our Page. She is very busy teaching Girl Scouts, preparing them in the big business of home-making. She has a class, too, for adult women (in cooperation with County Extension Service).

The purpose of both programs is to make for better and more efficient housewives. From such study, it is believed, happier homes, fewer divorces, and less crime will result. There is under plan a week-end class for brides-to-be. Girls now busy in all forms of employment will rejoice in such a prospect. Does it make you wish you lived near Cedar Hill?—Gertrude S. Stewart, N. J.

Prize Winning Hints

ONE seldom finds the hemstitching attachment being used in the country, but I consider mine a great economy. I advise every woman with a sewing machine to get one, for you can so quickly picot yards and yards of choice trimming.

When my oldest daughter's coat is worn in places, and past usefulness for her, I carefully rip it apart, clean thoroly, and perhaps turn the cloth, using the other side to make, with the aid of a Pennsylvania Farmer pattern, a fine new coat for the little one. This is a great saving in a large family.—Mrs. John Faulstich, Pa.

Waste Not—Want Not

SAVING is one of my fads. Like the tramp's manners, I must have been born with this fad for when I was a child mother often found it necessary to make a general clearing out of my collections, which were piled in two lower shelves of a famous old family cupboard. Anyway, when I came into my own home, imagine my delight when I spied a splendid attic, with rafters too, where I could stick things and still have the attic looking neat. Many an odd piece of board, pieces of quarter round, wire and tin went there—in fact anything lying around which I thought might be useful some day.

After we remodeled our house a few years ago and put in new windows, I raided the wood pile. There I found the slats which held in the old windows, pieces of boards, old shutters, boards from glass boxes, nails and wire; junk which might have been thrown away or used for kindling. What a time I had saving it!

When my son grew old enough to trap, he was delighted to find among those glass box boards one of the proper size and shape to use in stretching hides. When I wanted some special feeding boards for the brooder house, we found the very thing. We nailed three narrow boards on slats and tacked the old window molding around the edges, making a ledge so that the feed would not fall to the floor. I had my boy make these boards of different sizes so that I could use them later among the chicks of different ages. The nails saved from the boards and those picked up after carpenters were used. As I usually keep a supply of odd nails, "mother's" tool box is often in demand.

With the old shutters which I had saved the men made me several runs to put around chick coops, nailing strips across the ends, and then covering the tops with chicken wire. I always have two ready for an emergency, such as a late hatch of chicks.—M. S. S.

With the Beef Flank

BOIL a beef flank very tender, then pick all the meat into bits. Add salt and pepper to taste, and a dash of allspice. Put into a bag or cloth and under a heavy weight. You will then have a delicious something in the house for the cold supper, or it will slice into sandwich fillings that are different.—C. B. W.

A SUPERIOR RUG OF GENUINE CORK LINOLEUM

"I'm sorry for the woman who doesn't have one of these beautiful rugs."

"I don't see how I ever got along without it. So easy to clean—just a few strokes of the mop and my kitchen smiles! No wonder I like to keep it looking nice. It's real linoleum, too—the kind that wears and wears and wears."

HOW women appreciate these new smooth-surface, sanitary rugs! They make housekeeping so much easier. A few moments' mopping and a smooth-surface rug is spotless and its colors bright as the day it was bought. Back-breaking bending and kneeling to scrub old wood floors should be a thing of the past in every home. An Armstrong's Linoleum Rug means more leisure for the housewife yet her floors are always spick-and-span and sanitary.

When you buy a smooth-surface rug, see that it is real linoleum. There is all the difference in the world. An Armstrong Rug is genuine cork linoleum clear through to the burlap back—softer, more resilient and springy, it will outlast any other smooth rug under the same conditions. You can roll and re-roll and change it from room to room as often as you like. An Armstrong Rug is flexible, not brittle or stiff.

Look for the burlap back. If it hasn't a burlap back, it isn't linoleum. Armstrong's are the only smooth-surface rugs made in the larger room sizes, 12 ft. x 12 ft., and 12 ft. x 15 ft., as well as the usual smaller sizes.

"RUGS OF PRACTICAL BEAUTY"—*Free! Choose your Armstrong Rug from the twenty-eight patterns in this booklet, all illustrated in full color. Full instructions on proper care. The booklet is free. Write for it today. Address*

Are You Tired Sometimes?

Simple Cures Any Farmer's Wife Can Try Out

ARE housewives, even farmers wives, lazy? I may be mobbed for asking that question in these columns, but asking myself the same thing I make a mental inventory of my home and am obliged to render an affirmative verdict.

Some night when you are tired out, when you drag weary feet from room to room doing the things that must be done before the last light is extinguished, sit down by a cozy fire or in an open window according to the season and face the question of whether it is a spiritual or physical weariness that weighs you down.

Perhaps you were once a school teacher. Can you remember getting up at 6 A. M. to rush thru some written lesson papers left over from the night before? Remember the speed with which you washed and brushed your hair, sewed on a loose button, pinned a bit of lace in place, snatched a flower for your coat lapel, caught up a heavy book bag, scampered to the school house a mile away, went thru the busy hours of the day, and kept two mischievous lads a half hour after school, then begged to be allowed to get the evening meal when you reached home? After that you entertained company (perhaps the very man you now face every evening across the table), laughed, gave an opinion on any subject that came up however weighty, turned a clever phrase that brought a gleam of admiration to his face, sang or coaxed entrancing melodies from the piano, assured him it was still early when the clock struck ten, and after his departure, prepared lessons for the morrow until you heard the sound of the midnight bells.

Tired, you never thought of being tired. You hadn't time. Tomorrow morning get up early enough to start the day a half hour ahead of your work instead of a half hour behind. Be sure you have your morning bath and that your hair is dressed as carefully as it was in the old days. If a hairpin pulls, take time to replace it. If a lock falls into your eyes, fish out the neglected curling iron and curl that lock out of the way instead of pushing it back every five minutes during the day, twenty expenditures of strength every hour, 160 wasted motions every day, that one minute of time would have saved to say nothing of your improved appearance.

Snap into the Day's Work

Your toilet made, "Snap into the work." Dragging thru the process of sweeping and dusting one room takes an hour's time and as much strength as it would to do the whole house at high speed. You wouldn't put an automobile in low gear and expect it to creep twenty miles to town and twenty back. Three months of that kind of treatment would ruin the best car ever made. Yet a lot of us do our housework on low gear and wonder why we are worn out at the end of three or six or a dozen months.

Work when you work, rest when you rest, and smile—smile—smile. That ought to be the motto in every farmhouse kitchen. Dress well. Clothes help. Take time for play—a trip to town, a good picture show, a visit at the home of some friend. Think of yourself as an important somebody, making a home, and not as a household drudge.

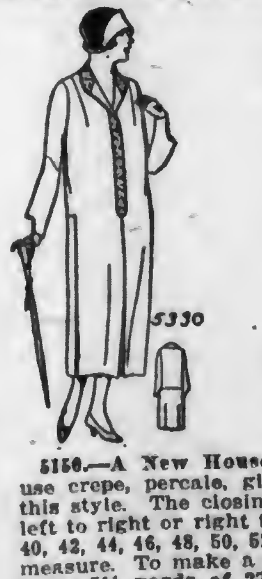
Easy to talk, but where's the

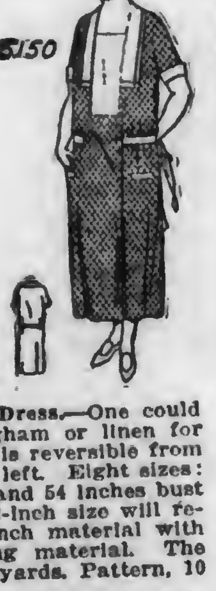
(Continued on the following page)

Patterns You'll Surely Like

Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

5330.—A Stylish Coat Dress.—Broadcloth with moire for trimming is here shown. This style is also attractive in faille, satin, kasha or fine serge. Nine sizes: 38, 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. A 44-inch size will require 4 yards of 40-inch material and ¼ yard of contrasting material for collar facing and for overlap. The width of the dress at the lower edge with plaits extended is 2½ yards. Pattern, 10 cents.

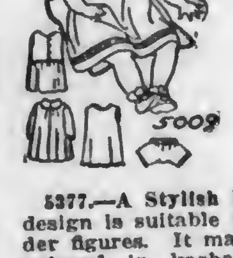


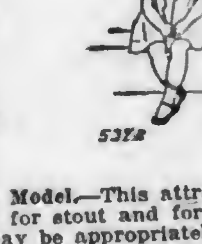


5150.—A New House Dress.—One could use crepe, percale, gingham or linen for this style. The closing is reversible from left to right or right to left. Eight sizes: 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. To make a 42-inch size will require 5⅛ yards of 27-inch material with 1⅝ yard of contrasting material. The width at the foot is 2 yards. Pattern, 10 cents.

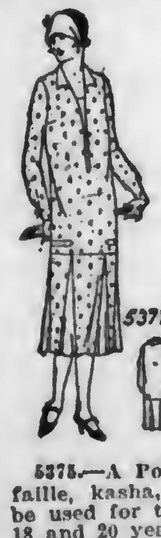
5009.—A Baby Outfit.—Voile, dimity, crepe, silk and chambray are good materials for this little dress and for the slip and drawers use cambric or lawn. Five sizes: 6 months, 1 year, 2, 3 and 4 years. A 2-year size requires ¾ yard of 36-inch material for the drawers, 1⅛ yard for the slip and 1¾ yard for the dress if made with long sleeves. If made with short sleeves ¼ yard less is required of 36-inch material. If slip is made without ruffle ⅛ yard less is required. Pattern, 10 cents.

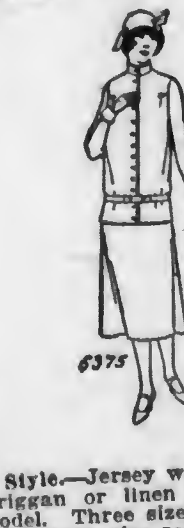
5372.—A Dainty Dress.—Challis or voile would be suitable for this style. It is also pleasing in gingham, crepe and China silk. Four sizes: 2, 4, 6 and 8 years. A 6-year size will require 2¼ yards of 32-inch material. Pattern, 10 cents.





5377.—A Stylish Model.—This attractive design is suitable for stout and for slender figures. It may be appropriately developed in kasha, satin, cashmere or faille. Eight sizes: 34, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. To make the dress for a 38-inch size will require 3⅜ yards of figured material and ⅞ yard of plain material 40 inches wide. The width of the dress at the lower edge is 2⅛ yards. Pattern, 10 cents.





5375.—A Popular Style.—Jersey weaves, faille, kasha, balbriggan or linen could be used for this model. Three sizes: 16, 18 and 20 years. A 16-year size requires 4¼ yards of 40-inch material if the blouse is made with long sleeves. If made with short sleeves 3⅞ yards will be required. For the blouse alone and with short sleeves 1¾ yard will be required. The width of the skirt at the lower edge is 1⅞ yard. Pattern, 10 cents.

"Ah! Animal Cookies!"

**Aren't these cookie cutters funny?
A cat, a horse, a goose, a bunny!**
—and there's a set for YOU!

CHILDREN can hardly wait until cookies are out of the oven when they're made with these animal cutters. Four in the set—cat, lamb, goose and bunny. And they'll cost you nothing but the packing and mailing cost—15c. With them we'll send a Davis Cook Book, too.

The cookies you'll make are examples of the many good things made with Davis Baking Powder. Davis is *pure* and *sure*—it makes baking lighter, finer in texture and more easily digested. Biscuits feathery light, cakes and cookies so palatable and pleasing! And in addition, it costs you less and you use no more than of any other high grade baking powder.

Bake it BEST with

DAVIS BAKING POWDER

NEW INVENTION SAVES MILLION

A Lamp that Burns 94% Air.

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, **J. O. Johnson, 642 N. Broad St., Philadelphia,** is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

Are You Tired Sometimes?

Simple Cures Any Farmer's Wife Can Try Out

ARE housewives, even farmers wives, lazy? I may be mobbed for asking that question in these columns, but asking myself the same thing I make a mental inventory of my home and am obliged to render an affirmative verdict.

Some night when you are tired out, when you drag weary feet from room to room doing the things that must be done before the last light is extinguished, sit down by a cozy fire or in an open window according to the season and face the question of whether it is a spiritual or physical weariness that weighs you down.

Perhaps you were once a school teacher. Can you remember getting up at 6 A. M. to rush thru some written lesson papers left over from the night before? Remember the speed with which you washed and brushed your hair, sewed on a loose button, pinned a bit of lace in place, snatched a flower for your coat lapel, caught up a heavy book bag, scampered to the school house a mile away, went thru the busy hours of the day, and kept two mischievous lads a half hour after school, then begged to be allowed to get the evening meal when you reached home? After that you entertained company (perhaps the very man you now face every evening across the table), laughed, gave an opinion on any subject that came up however weighty, turned a clever phrase that brought a gleam of admiration to his face, sang or coaxed entrancing melodies from the piano, assured him it was still early when the clock struck ten, and after his departure, prepared lessons for the morrow until you heard the sound of the midnight bells.

Tired, you never thought of being tired. You hadn't time. To-morrow morning get up early enough to start the day a half hour ahead of your work instead of a half hour behind. Be sure you have your morning bath and that your hair is dressed as carefully as it was in the old days. If a hairpin pulls, take time to replace it. If a lock falls into your eyes, fish out the neglected curling iron and curl that lock out of the way instead of pushing it back every five minutes during the day, twenty expenditures of strength every hour, 160 wasted motions every day, that one minute of time would have saved to say nothing of your improved appearance.

Snap into the Day's Work

Your toilet made, "Snap into the work." Dragging thru the process of sweeping and dusting one room takes an hour's time and as much strength as it would to do the whole house at high speed. You wouldn't put an automobile in low gear and expect it to creep twenty miles to town and twenty back. Three months of that kind of treatment would ruin the best car ever made. Yet a lot of us do our housework on low gear and wonder why we are worn out at the end of three or six or a dozen months.

Work when you work, rest when you rest, and smile—smile—smile. That ought to be the motto in every farmhouse kitchen. Dress well. Clothes help. Take time for play—a trip to town, a good picture show, a visit at the home of some friend. Think of yourself as an important somebody, making a home, and not as a household drudge.

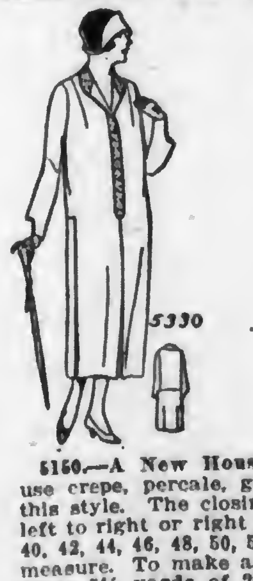
Easy to talk, but where's the

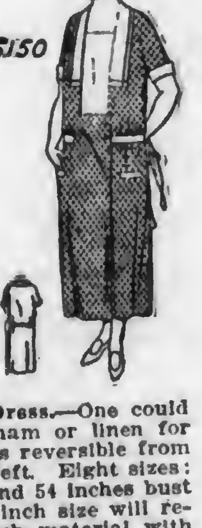
(Continued on the following page)

Patterns You'll Surely Like

Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

5330.—A Stylish Coat Dress.—Broadcloth with moire for trimming is here shown. This style is also attractive in faille, satin, kasha or fine serge. Nine sizes: 38, 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. A 44-inch size will require 4 yards of 40-inch material and ¼ yard of contrasting material for collar facing and for overlap. The width of the dress at the lower edge with plaits extended is 2⅛ yards. Pattern, 10 cents.

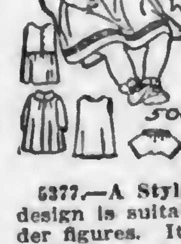


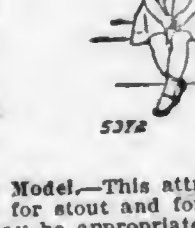


5150.—A New House Dress.—One could use crepe, percale, gingham or linen for this style. The closing is reversible from left to right or right to left. Eight sizes: 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. To make a 42-inch size will require 5⅛ yards of 27-inch material with 1⅜ yard of contrasting material. The width at the foot is 2 yards. Pattern, 10 cents.

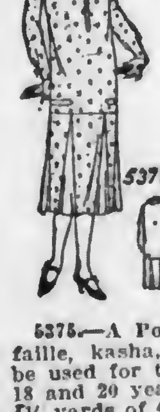
5009.—A Baby Outfit.—Voile, dimity, crepe, silk and chambray are good materials for this little dress and for the slip and drawers use cambric or lawn. Five sizes: 6 months, 1 year, 2, 3 and 4 years. A 2-year size requires ¾ yard of 36-inch material for the drawers, 1⅛ yard for the slip and 1¾ yard for the dress if made with long sleeves. If made with short sleeves ¼ yard less is required of 36-inch material. If slip is made without ruffle ⅛ yard less is required. Pattern, 10 cents.

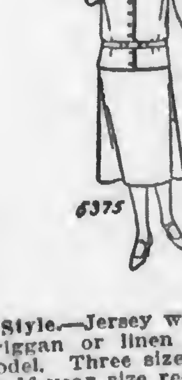
5372.—A Dainty Dress.—Challis or voile would be suitable for this style. It is also pleasing in gingham, crepe and China silk. Four sizes: 2, 4, 6 and 8 years. A 6-year size will require 2¼ yards of 32-inch material. Pattern, 10 cents.





5377.—A Stylish Model.—This attractive design is suitable for stout and for slender figures. It may be appropriately developed in kasha, satin, cashmere or faille. Eight sizes: 34, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. To make the dress for a 38-inch size will require 3⅜ yards of figured material and ⅞ yard of plain material 40 inches wide. The width of the dress at the lower edge is 2⅛ yards. Pattern, 10 cents.





5375.—A Popular Style.—Jersey weaves, faille, kasha, balbriggan or linen could be used for this model. Three sizes: 16, 18 and 20 years. A 16-year size requires 4¼ yards of 40-inch material if the blouse is made with long sleeves. If made with short sleeves 3⅞ yards will be required. For the blouse alone and with short sleeves 1¾ yard will be required. The width of the skirt at the lower edge is 1⅞ yard. Pattern, 10 cents.

"Ah! Animal Cookies!"

Aren't these cookie cutters funny? A cat, a horse, a goose, a bunny! *—and there's a set for YOU!*

CHILDREN can hardly wait until cookies are out of the oven when they're made with these animal cutters. Four in the set—cat, lamb, goose and bunny. And they'll cost you nothing but the packing and mailing cost—15c. With them we'll send a Davis Cook Book, too.

The cookies you'll make are examples of the many good things made with Davis Baking Powder. Davis is *pure* and *sure*—it makes baking lighter, finer in texture and more easily digested. Biscuits feathery light, cakes and cookies so palatable and pleasing! And in addition, it costs you less and you use no more than of any other high grade baking powder.

Bake it BEST with

INTENTIONAL SECOND EXPOSURE

BOSS THERMO
Electric and GasolineMotor **WASHERS**

Bring City Service to Country Homes

The sensational success of the THERMO Electric Washer with its high temperature washing process has created a big demand from country homes for the new THERMO Gasoline Motor Washer. The same exclusive and highly efficient heat-retaining construction is used in this latest model. Ample power is supplied by a 4 cycle, silent, dependable gasoline motor built like an auto engine. So simple that a child can operate it. Costs only 3c per hour to run.

The Boss Washer line includes many different models in electric, gasoline motor, hand, water and belt power. These quality washers can be bought from your dealer at present low prices from $7.75 up. Only a few are shown in this ad. More than 1,000,000 in use.

For more than 36 years Boss Washers have eliminated the drudgery of wash day in thousands of homes. Many bought 20 years ago are still serving their original owners. Boss Washers are strongly made and wash beautifully. Unsurpassed for fast and thorough work. The THERMO models are the only insulated heat-retaining washers made. In coldest weather they keep the wash water hot throughout the biggest washing; and when sultry, summer makes washing by ordinary means a most disagreeable task, THERMO eliminates the hottest part—the boiling of clothes.

Guaranteed by the Pioneer washer manufacturers—makers since 1889 of the well-known and time-tried Boss Washers. If your dealer does not have them we will ship you direct.

FREE booklet upon request. Use the coupon today!

Making Cheese at Home

Three Kinds That Very Seldom Fail

OF THE many kinds of cheese, the following are those that any one will be able to make.

Take two or three milkings of sweet skimmilk, strain into a crock and add coloring to make a rich cream color. Dissolve rennet tablets in cold water, (the directions on package will tell how many to the gallon of milk) care being taken to use the right quantity. Too much rennet will make a tough cheese and if only enough is used to curdle the milk the cheese will be very tender and fine for family use, but for market purposes it should be neither too tough nor too tender.

Our Fashion Book

OUR new 1926 spring and summer Book of Fashions is now ready for you. It contains color plates, 500 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, some pints for the needle (illustrating thirty of the various, simple stitches) and costs only ten cents. Send in your order today, with ten cents in silver or stamps, so that this book, full of valuable hints to the home dressmaker, will be sent you at once. Address, Pattern Department, Pennsylvania Farmer, 261 S. Third St., Philadelphia, Pa.

Stir the milk well when adding the rennet, then set on the stove and heat to about seventy degrees. At this temperature a thick curd will form and bubbles will rise in the center and burst, showing the whey clear and of a greenish hue. Now, stir until the curd is thoroly broken, let the milk sit on a cool stove and the curd will settle to the bottom. The whey may then be poured off. Season well with salt, stir again and pour in a cheesecloth bag. Set the bag inside a hoop, place on solid base, put a heavy weight on top and leave for thirty-six hours. It requires over three weeks to ripen before being fit to use.

Take a pint of cream and stir a teaspoonful of soda into it. Pour into a rather close cloth, tie up and hang in a cool, airy place for three or four days to drain. Then turn into a clean cloth, which must be put into a mold and under a weight for twenty-four hours longer. It is then ready for use.

Place on the stove a large kettle of fresh buttermilk and let it just come to a boil. Then add as much sweet milk as there is buttermilk. Stir just enough to mix, then let it again come to a boil and take off immediately and strain. After it drains, work the curd with the hand and fingers while quite warm for about ten minutes, add three tablespoonfuls of butter, salt to taste and make into balls.—Mrs. C. A. Umoselle.

Turn Your Winter Coat

DID you look at your winter coat and decide you must have a new one while the New Year sales were on? Did you find that the clothing budget could not allow it? Never mind: just examine the wrong side of your old coat, and if it is in good color and nice condition, turn it inside out and reline it. Be careful while ripping to note exactly how the pieces were put together. Should the material need cleaning, washing with a non-alkaline soap and lukewarm water is effective. Press smooth the material while damp on the wrong side. Materials with nap should be steamed. If the coat is light in color why not try dyeing it before making it up? I just did that with a tan one, and it is now a very pretty red.

You can add a bit of style by leaving off the belt and pockets. A welt or set-in pocket will give a new effect. Be sure to plan a becoming length. The button-holes will be on the reverse side of your coat. If you object to that sew up the openings and cover them with large buttons, or use braid sewed over them as a decorative feature. When the coat is finished if you do not feel equal to steaming and pressing it, a tailor will do the job for a small sum. Lastly, pin a gay flower on the collar and rejoice in your accomplishment.—Mrs. Edith Dilts, N. J.

Are You Tired Sometimes?

(Continued from preceding page)

money to come from? Every woman should have some money that she feels is her very own, and no woman can feel that money is her very own unless she earns it. That's the difference between the housekeeping and the teaching job.

The woman who drags, mopes, drudges, will do her housework and nothing beside. The woman who goes into her home job with the same vim and grin that she did into that of teaching will settle the question some way. In fact that is the whole secret, she'll settle things instead of letting them settle her.

There are Ways and Ways

Two pickings from the wild strawberries that are going to waste in the east meadow will sell for enough money to buy her the dress pattern she wants, the new hat, the toilet articles, creams, perfumes, powder, yes, rouge, if she used to wear it in the days when she was winning husband's love instead of keeping it. Cottage cheese and garden stuff sold from the stand in front of the house, if she happens to live on a state road, taking a little child to care for, furnishing dinners for the men working on the road, these are all ways in which the farmer's wife can earn something of her own. When she wanted a school she did not wait for directors to come to her and offer her a position. She went after it. And if she goes after it now any housewife can find a way of earning money.

But there are two pitfalls she should avoid—thinking that the time spent in picking the wild strawberries belongs to the home and so they must be canned, and later, when she has earned the money, remembering that a new broom is needed, a screen ought to be bought for the spare bedroom window, the sugar hasn't been ordered and that corn meal, stove polish and scouring soap must be had, so she'll pay for them out of her own money.

The farmer's wife who wakes up—rushes thru her work before she has time to get tired, takes a nap in the afternoon if she is up early in the morning and late at night, smiles, believes in herself, and rules her work instead of being ruled by it, is going to be stronger at the end of the year than she was at the beginning and the corners of her mouth will be turning up instead of down. As for wrinkles—not while she has the making of cucumber cream in the milk house and garden.—Lalia M. Thornton, N. Y.

Feeding Philadelphia

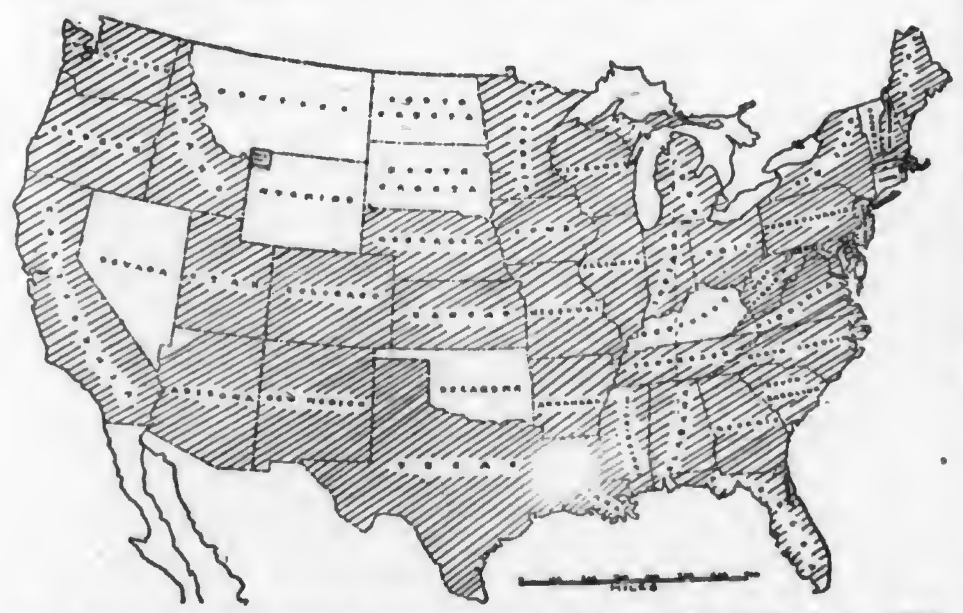
Nearly Every State Takes Part in the Gigantic Task

FARMERS in thirty-eight states and six foreign countries are working twelve months of the year to supply Philadelphia with fruits and vegetables. A stranger walking thru the wholesale districts of the city is almost sure to see some product that grew in his native state.

A comparatively short time ago Philadelphia and other large consuming markets depended upon the surrounding farms to supply their needs. Oranges, bananas and grapefruit were luxuries; strawberries, tomatoes and peas were unheard of in the middle of winter. Potatoes, cabbage and turnips were practically the only fresh vegetables available after frost and apples and pears were the only fruits.

The growth of transportation brought great changes. The fruit and vegetable industry grew by leaps and bounds, until today many of the fruits and vegetables can be bought any day of the year. The city grew and spread and the farmers within hauling distance were unable to feed them. The South and the far West came to their aid. Refrigerator cars, cold storage, improved packing and handling methods were developed.

Over 100 fruits and vegetables were sold in Philadelphia last year. More than sixty-five of these products arrived in straight carload lots. California, which is more than 3000 miles from Philadelphia, supplied 9487 cars or over twenty-two per cent of the total receipts.



The shaded states shipped fruits and vegetables to Philadelphia in 1925.

Mr. E. R. Biddle, in charge of the Philadelphia Office of the Bureau of Agricultural Economics states: "A total of 42,587 carloads of fruits and vegetables were consumed in Philadelphia during 1925. This means that a train more than a mile long was unloaded on this market every market day of the year and that a train of sufficient size to supply the city for the year would reach all the way to Pittsburgh."

Florida is second in importance as a source of supply. This state and California furnish together a larger variety of products than all the other states combined. A total of 7395 cars came from this section in 1925, showing that someone down there must be doing something besides selling real estate.

New York was next in number of cars shipped, with 6,107 reported. This was a little lighter than in 1924 and was due largely to the failure of the grape crop. Virginia was fourth and Pennsylvania fifth. Potatoes were the principal commodity from the Keystone State with about one-fourth of the total supply coming from this source. There were 2,256 cars of potatoes from Pennsylvania unloaded in Philadelphia and only 333 cars of other products. Of this number 215 cars were apples, 28 cabbage, 73 celery, 11 grapes, 3 carrots, 2 cauliflower and one car of onions.

Washington was the chief source of apples and supplied over 900 cars out of a total of 2,509. Oregon and Idaho in the West; Virginia and Delaware in the South aided in supplying Philadelphia with this fruit. New Jersey hauled large quantities of apples into the market and Pennsylvania farmers did their share.

Potatoes Head Commodity List

In spite of the fact that it takes nearly two weeks for Maine potatoes to reach Philadelphia, 1,401 cars were received in 1925. Potatoes lead all other products in the number of cars unloaded, totaling 8,698. Grapes were second with 4,956, and oranges followed with 3,084. The other principal commodities in order of their importance were: apples, lettuce, cabbage, onions, tomatoes, cantaloupes, celery and grapefruit.

Sections of New Jersey, Pennsylvania, Delaware and Maryland that formerly shipped their products to Philadelphia by rail are now using the motor truck. Large quantities of produce from these states are received but there is no means at present to obtain an accurate check on the amount. It is estimated that from 200 to 250 cars of New Jersey potatoes were hauled by motor truck to Philadelphia in 1925 from a section of the state that formerly shipped by rail. One firm is known to have hauled an equivalent of about 100 cars from this area.

Some idea of the amount of produce handled by express and in less than carload lots can be gained by considering that Florida alone shipped 3,550 refrigerator crates of strawberries to Philadelphia last year. Other sections forwarded 109,590 thirty-two quart crates in less than carload lots. California shipped an equivalent of fifteen cars of asparagus to this market by express.

From Foreign Countries

Holland, the land of dikes and windmills, supplied cabbage. Mexico, noted for revolutions and horse races, shipped cantaloupes and tomatoes in carload lots. From far off Egypt, land of mysteries and home of the Pharoahs, came onions. Spain also supplied the large Valencia onions, while sunny Italy sent cargoes of lemons, olives and chestnuts. China, in the Orient, sent peanuts equivalent to twelve carloads. There were hothouse grapes from Belgium, grown on vines hundreds of years old. Canadian potatoes competed with homegrown stock. The West Indies furnished tangerines, oranges, grapefruit, limes, tomatoes, potatoes and pineapples.—W. R. Whitacre.

OUR YOUNG PEOPLE'S FORUM.

Cousin Ruth's Letter

DEAR FORUM FRIENDS:—You had so much fun hunting for the answers in our Question and Answer Contest several weeks ago that I thought you might like to have another search thru the paper, not for answers this time but for words! Listed below are ten incomplete sentences. Read them over, then look thru this issue of Pennsylvania Farmer until you find these same sentences in complete form. Write them down, as they should be, underscoring the words which you have just filled in in place of the blank spaces. After each corrected sentence write the number of the page upon which you found the words you have used, then put the word "Contest" in the upper left hand corner and your name, age and address in the right hand corner and mail the paper to me.

The Incomplete Sentences

1. Cultivation was kept up, and a ——— crop of ——— or of ——— ——— was grown nearly every year.
2. Over ——— fruits and ——— were sold in ——— ——— last year.
3. These old ——— also make useful ——— tables.
4. It was the most successful short ——— ever held at ——— College.
5. MacVeigh wheeled ——— the one ——— of the cabin.
6. They average about ——— pounds ——— weight.
7. A ——— listener's aerial sticks up in the air and the passing ——— waves rub across it on their ——— journey.
8. It is the common ——— nowadays to ——— the seed with some commercial ——— of good quality.
9. Farming is the most ——— occupation a ——— can choose.
10. The chart is based on ——— issued by the ——— States Bureau of ——— Economics.

If you would like to write me a letter, too, when you send your reply to the contest please do so on a separate sheet of paper then it will be easier for me to select the winners in the contest. Your papers will be judged on three important things—correctness, neatness and spelling.

This time instead of three prizes there will be six, divided into two groups, three for the boys and girls twelve years old and over, and three for the boys and girls under twelve years old. A pair of ice skates will be awarded the first prize winner in each group, a fountain pen the second, and a schoolbox outfit the third. With such wonderful ice these winter days I should think every boy and girl would like to own the skates and anyone who is going to make neat papers, for our page or for school, will want the fountain pen or the schoolbox.

How I've been enjoying the valentines so many of you sent me. I didn't have room on my desk for all of them but one or two have found a corner. It would take too long to write and thank each one of you so I'll right here and now thank all who remembered me on Valentine's Day.

COUSIN RUTH.

From Forum Friends

Dear Cousin Ruth and Forum Friends:—Hello, everyone in this happy circle, I surely would like to see Cousin Ruth and all Forum friends together having lots of fun at a picnic or festival or at Cousin Ruth's birthday party. I think it would be great fun.

Miss Miriam Warner took her Sunday school class for a picnic last summer. We went down to Rockdale and had a very nice time. We went swimming and ate our dinner under the shade trees. Katherine Wentz, ten, Carroll County, Md.

I wish you could all have celebrated my birthday with me this month. Wouldn't it have been a grand birthday party?

Dear Cousin Ruth and Forum Friends:—I'm going to graduate from Center Hall School this May. (That is maybe). Then I am going to start working in the summer and the following September I am going to go to art school.

My mother is very sick so I must stay with my aunt until she is better. I have only been in the country four months, but I like it very much. I like to milk the cows and tend to the chickens. I have a darling little bantam rooster. I call it Limpy.

Has any one a good recipe for making macaroons? I have tried several but mother did not care much for them.

I hope you had a pleasant time over the holidays. I did.—Irma Mae Creveling, fourteen (x), Bucks Co., Pa.

BROWNIE, SISTER AND I
Helen Storer, Mercer County, N. J.

Dear Cousin Ruth and Forum Friends:—Altho I am only eight years old, I like to sew and cook and enjoy reading letters from girls who send recipes. I like to piece quilts. Will send some patterns if any one would like them.

Here is a recipe for popcorn balls, I think Gladys Fuller will like:

1 cup best molasses,
¼ cup white sugar.

Boil until the syrup makes a soft ball in cold water. Pour over freshly popped corn, stirring rapidly to mix well.

Dip hand in cold water frequently to prevent sticking. Form corn into balls.—Myrtle E. Smith, eight (x), Tioga Co., Pa.

Dear Cousin Ruth and Forum Friends:—Have you ever seen any pigs? My father and a few of our neighbors went today and bought nineteen in all. We kept ten of them.

We had a swell time at our entertainment. We had a Santa Claus. He gave us tricky presents.

I have not sent a recipe to the Forum Page so I will give one:

BUTTER SCOTCH

3 tablespoons molasses,
2 tablespoons sugar,
2 tablespoons water,
1 tablespoon butter,
¼ teaspoon soda.

This is the candy I like best. Cook the first four and after you have cooked it fifteen minutes put soda in and let rise. Put in buttered pans after it is cooked—Allen D. Reed, Schuylkill Co., Pa.

Dear Cousin Ruth and Forum Friends:—I have twelve traps set for skunks. I haven't caught anything yet but one weasel. My two brothers have caught six skunks and sent them away and got about fourteen dollars out of them, including one raccoon which was my cousin's. He got four dollars and ten cents out of it. It was a black skunk. The raccoon was caught in the summer.—George Fox, eleven, Butler County, Pa.

Dear Cousin Ruth:—If I may I would send you my photo and then you will know me better. I have not gone to school for two months because I have too far to go and the roads are drifted and rough but I am busy any way helping mother. I am in third grade and like to go to school very much.

AN ARMFUL
Joseph Pierce, Cumberland County, N. J.

We do not have much farm work just now but we get a lot of eggs and milk and good butter. I wish you could come and visit us on the farm. Did you notice my initials spell a word, R. O. C. K.?—Reba O. C. Kintzel, (X), Schuylkill County, Pa.

Dear Cousin Ruth:—The girls in my grade are having a sewing club, we are making dresses and covering cigar boxes for sewing boxes.

My little brother, who is only five years old, can milk two cows.

Cousin Ruth, I wish you were here to go sleigh riding with me. I agree with Ellen Pulis, don't you? Some more of you write from New Jersey. —Frances Johnson, nine, Hunterdon County, N. J.

OUR LITTLE FOLKS' PUZZLE CORNER

DEAR LITTLE FOLKS:—Trees always interest me and right now in the very earliest days of spring light, it seems to me that they are all looking very mysterious and happy about something. Maybe they are thinking how they will surprise us all in a few weeks when those little leaf buds begin to fill out. At any rate, if you will look carefully at the sentences below you will find in each one the name of a tree. I have asked my good friend who sets the type to let you in on the secret tree hiding in the first sentence, and you will easily see that it is a FIR. When you have found the tree in each of the sentences, write the name of the tree and the number of the sentence in which you found it and send it to me on a POSTCARD so that it reaches me by March 6th. BE SURE TO SAY HOW OLD YOU ARE. The ten children, sending in the correct answer, whose cards are the best in grammar, spelling, punctuation, penmanship and general appearance will each be awarded a set of pictures.

The Honor Prizes, bright and shiny pencils with a supply of leads, go to those Little Folks who send in correct, excellent answers to ten puzzles for ten straight weeks without missing,—one each week. Please remember that in order to win an Honor Prize your answers must be absolutely correct each week. Mistakes in spelling, punctuation, and failure to mention your age every time are only a few of the many errors that are made weekly.

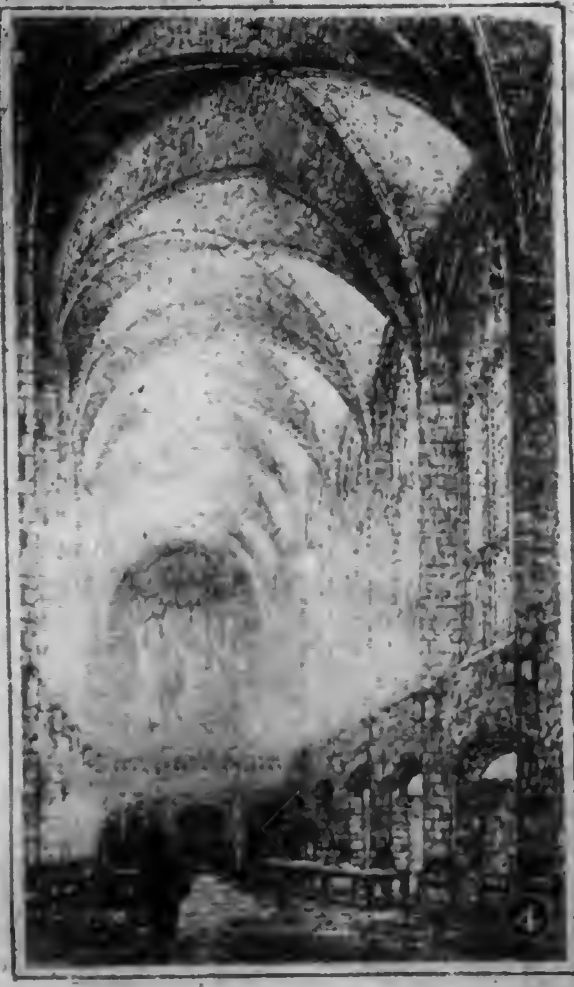
Address all replies to the PUZZLE EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

The answer to the puzzle published in the February 6 issue of Pennsylvania Farmer is: TAKE THE WEATHER AS IT COMES.

The puzzle prize winners are: Phillip H. Beaver, age 11, Easton, Md.; Marion Eberenz, age 9, Wellsboro, Pa.; Earl H. Fenstermaker, age 10, Kutztown, Pa.; C. Kimball Hicks, age 7, Spring City, Pa.; Thelma Kamb, age 8, Orwigsburg, Pa.; Joshua Kaufman, age 9, Croton, N. J.; Blanche Peck, age 9, Rockwood, Pa.; Donald Simpson, age 7, Trappe, Md.; Alfred W. Snook, age 11, Augusta, N. J.; Betty C. Way, age 10, Port Matilda, Pa.

1. Washington was our FIRst President.
2. Skaters were skimming over the ice, darting here and there.
3. The natives asked: "U do gwo O?" David nodded gravely.
4. One eye was closed.
5. Tops spin easily.
6. We watched them lock the gates.
7. Mabel, Mabel, why don't you come?
8. We saw a large boa killed by the explorers.
9. The pig was penned in.
10. Ma, please let me have it.
11. Can those sounds be echoes?
12. Then you will owe me nothing.

PASSING EVENTS IN PICTURES



(Copyright by Underwood & Underwood)

1.—All the beauty and splendor characteristic of the nineteenth century is depicted in this old castle in central Bohemia.
2.—A quintette of students at Wellesley College, Massachusetts, snowshoeing.
3.—An Oliver Twist of the present. These two children took part in a fashion show held in New York recently.
4.—Plan of the entrance hall to the new library which is to be erected at Yale University, Connecticut. When completed it will be the largest university library in the world, having a capacity of 5,000,000 volumes.
5.—Lord Willingdon, a prominent British statesmen, has been named as a possible Governor-General of Canada.
6.—These two bicycles, the oldest in the world, built in 1881, cost $150.
7.—Who wouldn't be proud to be the owner of such splendid puppies?
8.—Little Edith Derby, granddaughter of the late Theodore Roosevelt, recently unveiled the bronze plaque reproduced from a newspaper cartoon, "The Long Long Trail," which depicts the Colonel as a Rough Rider.

ICE-BOUND HEARTS

By James Oliver Curwood

OUR NEW SERIAL STORY
An Absorbing Tale of the Northwest Mounted Police.

AT POINT FULLERTON, one thousand miles straight north of civilization, Sergeant William MacVeigh wrote, with the stub of a pencil between his fingers, the last words of his semiannual report to the commissioner of the Royal Northwest Mounted Police at Regina. He concluded:

I beg to say that I have made every effort to run down Scottie Deane, the murderer. I have not given up hope of finding him, but I believe that he has gone from my territory, and is probably now somewhere within the limits of the Fort Churchill patrol. We have hunted the country for three hundred miles south along the shore of Hudson Bay to Eskimo Point, and as far north as Wagner Inlet. Within three months we have made three patrols west of the bay, traveling 1600 miles without finding our man or word of him. I respectfully advise a close watch of the patrols south of the Barren Lands.

"There!" said MacVeigh aloud, straightening his rounded shoulders with a groan of relief. "It's done!"

On his bunk, in a corner of the little wind-and-stormbeaten cabin which represented law at the top end of the earth, Private Pelletier lifted a head wearily and said:

"I'm bloomin' glad of it, Mac. Now mebby you'll give me a drink of water and shoot that devilish husky that keeps howling every now and then out there, as tho death was after me."

"Nervous?" questioned MacVeigh, stretching his strong young frame with another sigh of satisfaction. "What if you had to write this twice a year?" And he pointed at the report.

"It isn't any longer than the letters you wrote to that girl of yours—"

Pelletier stopped short. There was a moment of embarrassing silence. Then he added bluntly, and with a hand reaching out, "I beg your pardon, Mac. It's this fever. I forgot for a moment that—that you two—had broken—"

"That's all right," said MacVeigh, with a quiver in his voice, as he turned for the water.

"You see," he added, returning with a tin cup, "this report is different. When you're writing to the big mogul himself something gets on your nerves. And it has been a bad year with us, Pelly. We fell down on Scottie, and let the raiders from that whaler get away from us. And —by Jo, I forgot to mention the wolves!"

"Put in a P. S.," suggested Pelletier.

"A. P. S. to his royal nibs," cried MacVeigh, staring increduously.

He spoke cheerfully, trying to bring a smile to the other's pale face. Pelletier dropped back with a sigh.

"No—there isn't any use feeling my pulse," he repeated. "It isn't sickness, Mac—not sickness of the ordinary sort. It's in my brain—that's where it is. Think of it—nine months up here and never a glimpse of a white man's face except yours. Nine months without the sound of a woman's voice. Nine months of just that dead, gray world out there, with the northern lights hissing at us every night like snakes, and the black rocks staring at us as they've stared for a million centuries.

"There may be glory in it, but that's all. We're 'eroes all right, but there's no one knows it but ourselves and the six hundred and forty-nine other men of the Royal Mounted. My God, what I'd give for the sight of a girl's face—for just a moment's touch of her hand! It would drive out this fever, for it's the fever of loneliness, Billy—a sort of madness, and it's splitting my 'ead."

"Tush, tush," said MacVeigh, taking his mate's hand. "Wake up, Pelly. Think of what's coming. Only a few months more of it and we'll be changed. And then—think of what a heaven you'll be entering. You'll be able to enjoy it more than the other fellows, for they've never had this. And I'm going to bring you back a letter—from the little girl—"

Pelletier's face brightened.

"God bless her!" he exclaimed. "There'll be letters from her—a dozen of them. She's waited a long time for me, and she's a true little redcoat to the bottom of her dear heart. You've got my letter safe?"

"Yes."

MacVeigh went back to the rough little table and added still further to his report to the commissioner of the Royal Mounted, in the following words:

Pelletier is sick with a strange trouble in his head. At times I have been afraid he was going mad, and if he lives I advise his transfer south at an early date. I am leaving for Churchill two weeks ahead of the usual time, in order to get medicines. I also wish to add a word to what I said about wolves in my last report. We have seen them repeatedly in packs of from fifty to one thousand. Late this autumn a pack attacked a large herd of traveling caribou fifteen miles in from the bay, and we counted the remains of one hundred and sixty animals killed over a distance of less than three miles. It is my opinion that the wolves kill at least five thousand caribou in this patrol each year.

I have the honor to be, sir,
Your obedient servant,
William MacVeigh, Sergeant,
In charge of detachment.

He folded the report, placed it with other treasures in the waterproof rubber bag which always went into his pack, and returned to Pelletier's side.

"I hate to leave you alone, Pelly," he said. "But I'll make a fast trip of it—four hundred and fifty miles over the ice, and I'll do it in ten days or bust. Then ten days back, mebby two weeks, and you'll have the medicines and the letters. Hurrah!"

"Hurrah!" cried Pelletier.

MacVeigh wheeled toward the one wall. Something rose up in MacVeigh's throat and choked him as he gripped Pelletier's hand.

"My God, Bill, is that the sun?" suddenly cried Pelletier.

MacVeigh wheeled toward the one window of the cabin. The sick man tumbled from his bunk. Together they stood for a moment at the window, staring far to the south and east, where a faint red rim of gold shot up thru the leaden sky.

"IT'S the sun," said MacVeigh, like one speaking a prayer.

"The first in four months," breathed Pelletier.

Like starving men, the two gazed thru the window. The golden light lingered for a few moments, then died away. Pelletier went back to his bunk.

Half an hour later four dogs, a sledge, and a man were moving swiftly thru the dead and silent gloom of arctic day. Sergeant MacVeigh was on his way to Fort Churchill, more than four hundred miles away.

This is the loneliest journey in the world, the trip down from the solitary little wind-beaten cabin at Point Fullerton to Fort Churchill. That cabin has but one rival in the whole of the Northland—the other cabin at Herschel Island, at the mouth of the Firth, where twenty-one wooden crosses mark twenty-one white men's graves. But whalers come to Herschel. Unless by accident, or to break the laws, they never come in the neighborhood of Fullerton. It is at Fullerton that men die of the most terrible thing in the world—loneliness. In the little cabin men have gone mad.

The gloomy truth oppressed MacVeigh as he guided his dog-team over the ice into the south. He was afraid for Pelletier. He prayed that Pelletier might see the sun now and then. On the second day, he stopped at a cache of fish which they had put up in the early autumn for dog-feed. He stopped at a second cache on the fifth day, and spent the sixth night at an Eskimoo igloo at Blind Eskimo Point. Late on the ninth day, he came into Fort Churchill, with an average of fifty miles a day to his credit.

From Fullerton men came in nearer dead than alive, when they made the hazard in winter. MacVeigh's face was raw from the beat of the wind. His eyes were red. He had a touch of runner's cramp. He slept for twenty-four hours in a warm bed without stirring. When he awoke he raged at the commanding officer of the barrack for letting him sleep so long; ate three meals in one, and did up his business in a hurry.

His heart warmed with pleasure when he sorted out his mail nine letters for Pelletier, all addressed in the same small, girlish hand. There was none for himself—none of the sort which Pelletier was receiving, and the sickening loneliness within him grew almost suffocating.

HE LAUGHED softly as he broke a law. He opened one of Pelletier's letters—the last one written, and calmly read it. It was filled with the sweet tenderness of a girl's love, and tears came into his red eyes. Then he sat down and answered it. He told the girl about Pelletier, and confessed to her that he had opened her last letter.

The chief of what he said was that it would be a glorious surprise to a man who was going mad—only he used loneliness in place of madness—if she would come up to Churchill the following spring, and marry him there. He told her that he had opened her letter because he loved Pelletier more than most men loved their brothers. Then he resealed the letter, gave his mail to the superintendent, packed his medicines and supplies, and made ready to return.

On this same day there came into Churchill a half-breed who had been hunting white foxes near Blind Eskimo, and who now and then did scout work for the department. He brought the information that he had seen a white man and a white woman ten miles south of the Maguse River. The news thrilled MacVeigh.

"I'll stop at the Eskimo camp," he said to the superintendent. "It's worth investigating, for I never knew of a white woman north of Sixty in this country It might be Scottie Deane."

"Not very likely," replied the superintendent. "Scottie is a tall man, straight and powerful. Coujag says this man was no taller than himself, and walked like a hunchback. But if there are white people out there, their history is worth knowing."

The following morning MacVeigh started north. He reached the half dozen igloos which made up the Eskimo village late the third day. Bye-Bye, the chief man, offered him no encouragement. MacVeigh gave him a pound of bacon, and in return for the magnificent present, Bye-Bye told him that he had seen no white people.

MacVeigh gave him another pound, and Bye-Bye added that he had not heard of any white people. He listened with the lifeless stare of a walrus while MacVeigh impressed upon him that he was going inland the next morning to search for white people whom he had heard were there. That night, in a blinding snowstorm, Bye-Bye disappeared from camp.

MacVeigh left his dogs to rest up at the igloo village and swung northwest on snow-shoes with the break of arctic dawn, which was but little better than the night itself. He planned to continue in this direction until he struck the barren, then patrol in a wide circle that would bring him back to the Eskimo camp the next night.

FROM the first he was handicapped by the storm. He lost Bye-Bye's snowshoe tracks a hundred yards from the igloos. All that day he searched in sheltered places for signs of a camp or trail.

He stopped to build a fire of scrub-brush and eat his supper on the edge of the barren, just as the cold stars began blazing over his head. It was a white, still night. The southern timber-line lay far behind him, and to the north there was no timber for three hundred miles. Between those lines there was no life, and so there was no sound. On the west the barren thrust itself down in a long finger ten miles in width, and across that MacVeigh would have to strike to reach the wooded country beyond.

It was over there that he had the greatest hope of discovering a trail. After he had finished his supper he loaded his pipe, and sat hunched close up to his fire, staring out over the barren.

He was accustomed to loneliness; he had laughed in the face of things that had driven other men mad. But tonight there seemed to be something about him that he had never known before, something that wormed its way deep down into his soul and made his pulse beat faster. He thought of Pelletier on his fever-bed, of Scottie Deane, and then of himself. After all, was there much to choose between the three?

A picture rose slowly before him in the bush fire, and in that picture he saw Scottie, the man-hunted man, fighting a great fight to keep himself from being hung by the neck until he was dead; and then he saw Pelletier, dying of the sickness which comes of loneliness—and beyond these two, like a pale cameo appearing for a moment out of gloom, he saw the picture of a face. It was a girl's face, and it was gone in an instant. He had hoped against hope that she would write to him again. But she had failed him.

He rose to his feet with a little laugh, partly of joy and partly of pain, as he thought of the true heart that was waiting for Pelletier. He tied on his snow-shoes and struck out over the barren. He moved swiftly, looking sharply ahead of him. The night grew brighter, the stars more brilliant. The zip, zip, zip of the tails of his snow-shoes was the only sound he heard, except the first faint, hissing monotone of the aurora in the northern skies, which came to him like the shivering glide of steel sledge-runners on hard snow.

In place of sound the night about him began to fill with ghostly life. His shadow beckoned and grimaced ahead of him, and the stunted bush seemed to move. His eyes were alert and questing. To himself he reasoned that he would see nothing, and yet some unusual instinct moved him to caution. At regular intervals he stopped to listen, and to sniff the air for an odor of smoke. More and more he became like a beast of prey. He left the last bush behind him. Ahead of him the starlit space was now unbroken by a single shadow. Weird whispers came with a low wind that was gathering in the north. Suddenly he stopped, and swung his rifle into the crook of his arm. Something that was not the wind had come up out of the night. He lifted his fur cap from his ears and listened. He heard it again—faintly—the frosty singing of sledge-runners.

The sledge was approaching from the open barren, and he cleared for action. He took off his heavy fur mittens and snapped them to his belt, replacing them with his light service-gloves, and examined his revolver to see that the cylinder was not frozen. Then he stood silent, and waited.

Out of the gloom a sledge approached slowly. It took form at last in a dim shadow, and MacVeigh saw that it would pass very near to him. He made out, one after another, a human figure, three dogs, and the toboggan. There was something appaling in the quiet of this specter of life looming up out of the night.

He could no longer hear the sledge, tho it was withing fifty paces of him. The figure in advance walked slowly and with bowed head, and the dogs and the sledge followed in a ghostly line. Human leader and animals were oblivious to MacVeigh, silent and staring in the white night. They were opposite him before he moved.

Then he strode out quickly, with a loud halloo. At the sound of his voice there followed a low cry, the dogs stopped in their traces, and the figure ran back to the sledge. MacVeigh grasped his revolver. Half a dozen long strides and he had reached the sledge. A white face stared at him in the shimmering light. MacVeigh stared back in utter astonishment, for the great, dark, frightened eyes that looked across at him, and the pale face, were the eyes and the face of a woman.

(To be continued next week)

Women Have the First Word

PROBABLY every man does some things that hurt or exasperate or offend his wife. Perhaps he says "my" when he should say "our." Maybe he punishes the children when she thinks they shouldn't be punished. Or he may like to tell her how popular he was with the fair sex before he was married. Or he may always be late to dinner, or always borrowing his wife's big scissors and leaving them at the barn, or going off to town and forgetting that someone would like to go along occasionally.

Pennsylvania Farmer will give a prize of $5.00 for the best letter on this subject:

Things I Wish My Husband Wouldn't Do.

Other letters which are published will be paid for at space rates. Writers may sign a pen name to be used if their letters are published.

Men are not eligible to this contest. Their turn will come later.

Letters should not be longer than 300 words and should be in our hands by March 13th. Address them to WEEKLY CONTEST EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

Woman Made a Trustee

MRS. WILLIAM D. PHILLIPS, Washington, has been appointed as a member of the Board of Trustees of the Pennsylvania State College by Governor Pinchot. Mrs. Phillips has the distinction of being the first woman to serve as a member of the board. She was instrumental in organizing a number of home economics committees of the Grange in Washington County and thru the activity of these committees substantial contributions were made to the Penn State Emergency Building Fund.—A. L. B.

Old Colonial Family Homesteads

No.37—The Park Farm

IN the autumn of 1777 Samuel Park came over the mountains into what is now Washington County and bought of Matthew Rogers in consideration of 450 pounds a parcel of land in two drafts, situated on "Chartiers Waters," known as "Deer Park" and "Experiment."

In the year following a patent was granted to John Park for "Experiment" containing 187 acres.

About 1821 John Park, Jr., by purchase and inheritance came into possession of it. At his death, his son, Johnson Park, inherited and sold it to William Park in 1862. His son, John Park, soon came into possession by parental gift and purchase and lived on it until his death in 1893.

Thus this tract, with the exception of seven years, has been in the possession of John Park, the father, the son and the grandson. At present it is owned by Alma Park Brown, Tamar Park Boyce, and Dr. C. E. Park, who has a son John.—Mrs. W. F. Boyce.

No.38—The Weber Farm

IN the year 1784, Henry Weber purchased a farm in Bricknock Township, Berks County, Pa. He came from Earl Township, Lancaster County. He was a son of Christian Weber and a grandson of the immigrant, Henry Weber, who had settled in Earl Township, Lancaster County in 1723.

He farmed this farm until his death in 1827, having lived on the farm forty-three years. At his death, his son Henry bought the farm. He was born on this farm and lived all his life on it. He died in 1873 having owned the farm forty-six years. When he died his son, Henry G., became the owner. He also was born on the farm and has so far always lived on it. He is now past eighty-three years and has been in bed over a year. He has been owner of the farm for fifty-two years.

The farm has now been in the Weber family for 141 years and in all this time it had only three owners and their names all Henry. The farm is at present farmed by a son of Henry G., Samuel M. Weber. The farm is one of the best in the township. The barn was built by the first Henry Weber and is now 114 years old.—Aaron M. Weber.

No.39 — The Deardorff Farm

ON April 16, 1811, Jonas Byers and wife deeded to Anthony Deardorff a tract of land situated in Franklin Township, Adams County, Pa., containing 180 acres. The next owner was his son, Barnard Deardorff. In 1873, the farm came into possession of Barnard's son, Jacob F., and in June, 1916, was purchased by the present owner, Ira L., son of Jacob F., who is looking forward to the time when his son, John Jacob, will become owner.

This farm has not only been owned by the Deardorff family, but has been farmed continually by some member of the family since 1811.

The large stone house on the farm was built in 1835 by Anthony Deardorff. The barn, which is 50 by 90, was built in 1885 by Jacob F. Deardorff.

Marsh creek flows thru the farm. It has a water power, but has not been in operation for some years.—Ira L. Deardorff.

News and Notes

A BILL has been introduced into Congress providing for the gradual adoption in the United States of the metric system of weights and measures. The metric units are used in practically every civilized country except the United States and Great Britain.

* * *

When we adopt the metric system we shall speak of centimeters, meters and kilometers instead of inches, yards and miles; liters instead of quarts; grams and kilograms instead of ounces and pounds. A centimeter is slightly over a third of an inch; 100 centimeters make a meter, 1000 meters make a kilometer, which is about two-thirds of a mile. A liter is about five per cent larger than our liquid quart. A kilogram is about 2.2 pounds. A gram is one thousandth part of a kilogram and is equal to the weight of one cubic centimeter of water.

* * *

Cows milked three times a day give considerably more milk than those milked only twice, and they hold up better near the end of the lactation period. The United States Department of Agriculture in recent experiments found that the increase over a short period was 12.5 per cent, while over a long period the increase is even greater. It hasn't been proven that the amount of milk produced by the extra milking is enough to pay for the extra cost of three-times-a-day milking.

During December 1533 cows in Pennsylvania cow testing associations produced more than half a ton of milk each, and 1324 produced forty or more pounds of butterfat. A Holstein owned by L. A. Zimmerman of the Carbon-Lehigh Association produced nearly a ton and a half of milk during the month.

* * *

County agents are now enrolling those who wish to enter litters of pigs in the 1926 Keystone ton litter contest. Last year 256 litters in forty-three counties were entered and 121 litters reached the goal, weighing more than a ton at the age of 180 days.

* * *

In 1884 two-fifths of the milk shipped into New York City was adulterated with added water or skimmed milk, C. P. Norgord, of the New York Department of Farms and Markets told visitors at Cornell University during farmers' week. Out of samples from 61,000 producers recently inspected only three-tenths of one per cent were found to be adulterated.

* * *

Before this appears in print a play called "Abie's Irish Rose" will have been given in a New York City theatre for the 1600th consecutive time. This is the fourth year this show has been given once practically every day and twice a day on Wednesdays and Saturdays.

Did you ever hear this one?—

Miss Teachem, wishing to arouse the interest of her Sunday school class, asked the scholars to write down the names of their favorite hymns.

All bent their heads over pencil and paper for a few minutes and then handed in their slips. All except Mary.

"Come, Mary," said the teacher, "write down the name of your favorite hymn and bring the paper to me."

Mary wrote, and with downcast eyes and flaming cheeks, handed the teacher a slip of paper bearing the words, "Willie Smith."—Youth's Companion.

He was a hard-looking ruffian, but his counsel, in a voice husky with emotion, addressed the jury.

"Gentlemen," said he, "my client was driven by want of food to take the small sum of money. All he wanted was sufficient money to buy food for his little ones. Evidence of this lies in the fact that he didn't take a pocketbook containing $250 that was lying in the room."

The counsel paused for a moment, and then the silence was interrupted by a sob of the prisoner.

"Why do you weep?" asked the judge.

"Because," replied the prisoner, "I didn't see the pocketbook."—National Republican.

"Mother, make Jane quit singing." This gentle command came for the second time from upstairs, where Jimmy and Jane were supposed to have been asleep. "Jimmy, pay no attention to Jane. Be a little man and go to sleep," answered the mother. "I am a man, mother. Jane keeps singing 'The Star Spangled Banner,' and I have to stand up."—Indianapolis News.

These Trees Doubly Certified—You'll Get the Right Fruit From Kellys'

You are doubly protected against disappointment and loss by the True-to-Name Lead Seal of the Massachusetts Fruit Growers' Association and our own Guarantee.

The Association is, of course, outside our organization and disinterested. Its corp of examiners under the direction of Dr. Shaw—an eminent authority on fruit growing—have inspected and certified 85,000 Kellys' trees to be "True-to-Name" for the 1926 season. Their Lead Seal stays on the tree until it bears fruit true to name.

Our Guarantee is also a real protection to you. We have a reputation to sustain, built up over a period of 46 years, nearly half a century.

Our many years' experience and the fact that all Kellys' trees are propagated on whole root, imported seedlings—not on piece roots—planted on upland ground where there is good air drainage, account for the success of our customers.

And you save the middlemen's profit on the highest quality trees when you order Kellys'. Our Big Catalog is our only salesman—you buy from us direct and we are directly responsible to you for your results.

Ask About Our New Cortland Apple

To be fair, we must fill all orders in the rotation received. You should plan to order your selection of doubly certified "True-to-Name" stock early and let us hold it for you. So write today for your copy of our big 1926 Catalog.

Why I Want My Son to Be a Farmer

Contest Editor's Note:—There were eight readers favoring farm life as a future for their sons to each one against it, among those who entered this first weekly contest. So many good contributions were received that the judges had unusual difficulty in choosing the one to be awarded the first prize. We are publishing herewith as many as possible of the letters from readers who want their sons to be farmers. Letters on the other side of the question will be printed next week, and as many more on both sides as space permits in later issues.

SO HE CAN EXPRESS HIMSELF

Awarded $5.00 Prize

I WANT my son to be a farmer because there is no greater occupation known to man, no one that leads to greater self-expression and self-content, to a happier and healthier mind and body.

Don't keep the son in the dark. Explain to him early in life how the seed unfolds to produce the plant, the flower, the fruit and seed. How the animal and fowl respond to breeding, feeding and selection of type. How the wonders of the soil and sky guided by the farmer's hand and thought, create the food and clothing of the human race. Thus my son can work out his own sweet will, his talents and desires and happiness.

If he is a born inventor and mechanic, we need him. Machinery must more and more take the place of man and horse labor on our farms.

If he is an artist he can express himself in the farm home and landscape.

If he loves plant life, he can improve what he finds and create new wonders for man's benefit.

If he loves animal life he can breed new strains and more productive specimens.

No Industry Needs Him More

If he is a leader, an organizer, a financier, the business of farming is calling him. There is no industry that needs him so much. There is no limit to the height he can climb.

To be a farmer, to help put farming on a schedule, under a system regulated for quality and economy, to make it a cost-plus producer, a life and a science, is no mean job.

To take up the reins where I lay them down and devote his greatest talents and ambitions to such a worthy cause, will not only bring to expression the inborn promptings of a soul but will lead thousands of his fellow-men to a fuller, happier and more productive life.—E. R. Green, Harford County, Maryland.

HOGS AND A BROWN-EYED BOY

FARMING is the most independent occupation a boy can choose. When he wants a day off he can take it. If he has a business meeting, or a social gathering he would like to attend, he can plan his work accordingly, and he will never miss the day spent away from home.

Farming has not been profitable, but has been holding its own; but it is going to be profitable in a very few years, for the good up-to-date farmer. He must have some education, and ever be on the lookout for the crop that pays the best. He must not follow in the rut of his forefathers, but get out of that rut, clear up on top, and keep going. It won't do for a farmer to lag, and sit around—for so will his help do likewise.

I want my boy to be wide awake, looking for something or some way to get the most out of farming. I want him to see and plan for himself.

If boys were encouraged to take hold of new things and not held back by old fashioned fathers who are afraid to spend a few dollars as an investment, more boys would stay right on the farm. Children of today are not satisfied to stay tied to the apron string or overall buckle, but want to see what they can do. Let them invest their money. If they lose, help them out in a way; they will be more cautious the next time.

A very bright boy living near me had a book sent to him on gentian. He read his book several times over, then took it to his mother, saying, "I would like to try this, mother." The mother looked over the book and said, "All right, my boy. I will loan you the money; you may go to work and fix up the bed."

The boy was only twelve, it was hard work, too. The roots were sent for and planted, the seed was gathered each year and planted in new rows. It was new and very interesting.

When the first roots were almost ready to sell, his father turned the hogs out. They broke into the bed, rooted, ate, and destroyed that child's years of work. The hogs grunted, so did that boy's father. That was all. Great brown eyes full of wonder looked up in his mother's face. The mother and son had a heart-to-heart talk. There wasn't any loan to pay back.

He Couldn't Stay

This boy went thru school and came to his mother saying, "It is impossible for me to waste my time here, much as I would like to stay." His mother gave him a college course. He is a great success in a neighboring state.

I want to say right here, seventy-five per cent of the boys leave the farm on account of lack of foresight in the father. Farming is advancing like everything else. If our boys are to stay with us, and be farmers, buildings must be kept up, machinery good, not breaking with every turn. The boy must have cheerful, encouraging words, occasional praise, pleasure as well as work, or he, too, will become disgusted and leave the farm.—B. K.

THE NATION'S BACKBONE

IF WE are to believe that agriculture is the backbone of the nation, which experts and statesmen repeatedly have assured us to be so, then every farmer has the right to take pride in his vocation because of its necessity to our national welfare and prosperity. Nearly every father who loves and takes pride in his vocation would like his son to follow in his footsteps, trying to make that vocation better and more helpful to human welfare. Then why should not the farmer desire his son to do likewise?

It has been the custom in the past to send the more talented of the farmers' sons away to schools and college, not to become more intelligent farmers, but to be doctors, lawyers, etc., just as tho the farm could not use the more gifted or talented sons it produced.

Conditions Have Taught Differently

However, economic conditions have taught us a different lesson and today we are beginning to realize that the farm requires the best that can be produced and farming is no longer work for the less talented but a vocation worthy of the best brains to be had. Then if I want my son to be my successor in the future I know he must be intelligent and educated.

Farming is one occupation in which both capital and labor are on an equal footing and work hand in hand. There is no jealousy and petty strife as to who should be first. Every dollar the farmer invests in his farm and crops he knows will produce the largest dividend if he

uses his intelligence and hands wisely.

I cannot help but feel and can honestly say that I do not believe my son could choose a better calling than that of becoming an intelligent farmer.—Earl W. Stallie, Schuylkill County, Pa.

BACK TO THE FARM AT 38

AFTER working for farmers, liverymen, in the stores, mines and on section gangs in the trolley lines, also for contractors in all lines of construction work and in the big lumber woods from the time I was fifteen years old until I was thirty-eight, I went back to the farm. I was raised on a farm, but like all the young bloods, I thought I wanted town work.

I find there is only a bare living when you work for another, and that you are to them as a piece of machinery. No matter how much interest you show in your work, you do not have the interest in it that you do in your own farm work.

You watch your own crops and stock grow with a different interest. Perhaps a pest of some kind hits your crops, or disease hits your stock. You are discouraged, but put all your efforts and resources into fighting that pest. You are much more at freedom in the country than you can be at the city job. You are also sure of enough to live on. No strikes or labor disputes to keep you idle for weeks and possibly months, with expenses mounting up, and you growing soft of muscle to go back and work harder than you did before the suspension or strike.

So I hope to see my son be a farmer.—Everett S. Warner, Wayne County, Pa.

THE SPICE OF LIFE

FARMING being the basis of the preservation of life, I want my son to be a producer of those products of the soil which sustain it; that in his youth he may accomplish much, to be enjoyed thru the rest of his life somewhere as a farmer, in the proud possession of a well-kept farm.

The causes for this wish are many; the reasons for a few of the "whys" I will try to give: Contentment is the richest spice of life. Nowhere is it so manifest as out on the farm rightly kept. The stock have it. The house pets dote on it. It is in the whole environment round about the premises. Why ought not my son develop into the highest type of a useful man in every sense of usefulness, under the congenial influences of an agricultural occupation, hedged about with contentment?

Then I want my boy to have a strong, robust body with good health, so that he and the choice of his love can produce out there on the farm a family of ideal Americans, free from the corruption and deception of so many of the so-called "standards of city morals."

To Be a Free Man

Again, I want my boy to be a free man working with his hands and mind toward and into, a service that is an essential to the life and happiness of many people. In taking a broad survey of opportunities, the occupation of farming offers the best. He would not be in the position of his city cousin—a cup of coffee—a cracker—a street car so as to be able to punch the time-clock before the door is locked or the next punching period is on.

And lastly, I want my son to help nature produce the "Ideals of Perfection," and to the farm is the only laboratory to which I can point where these perfections are being worked out as Nature decrees. Not too large a farm. It is often a nice matter to decide between acres and contentment, for sometimes too much is worse than too litle. Here he has grasped happiness. Here it is; he has it for the asking. Will he take it?—George T. Underwood, Clearfield County, Pa.

MACHINES MAKE HARD JOBS EASY

THE progressive farmer makes a good living and puts some aside for a rainy day. Besides being out in the open air on the farm insures good health. He sees the forces of Nature at work and learns to love his work, with the many different jobs more than the man with one job, which often becomes a grind to him. The farm home offers a more restful sleep at night, than the town or city with its many noises. A farm home with a radio and nearly all the conveniences a city can have, offers enjoyment with better food than can be had in town.

Hard Jobs Are Fewer

Farming used to be considered about the hardest job a man could get, but today with the many labor saving machines, the hard jobs are few and do not last long. Thus the farmer has more time to himself to do as he likes.

The farmer can hustle his work thru and take a few days' vacation at different times in the year without being the loser. The city man must take his vacation when it suits the employer, and many get none at all without losing his pay.

I think most of our great men in history were raised on farms. The well-known ones were—Washington, Lincoln, Jefferson and many others down to Coolidge. To put in a few words, I think it is the most educative, healthy, dependable and remunerative job on this earth.—Miles E. Cochran, Lancaster County, Pa.

WHAT HE EARNS IS HIS

THERE are three reasons why I want my son to choose farming as his vocation.

First, it is the most independent vocation of the present day. The farmer has no boss hovering over him from whom he must take his orders each day. He has no fear of being fired by someone higher up, and having to start life all over again with a new company. The farmer does not have to punch a time clock, which to the spirit of a sensitive man seems like slavery.

The farmer is able to plan his own work and to see his plans develop. He feels independent of his fellow-man when he surveys his fields of grain and realizes that all profits derived from them are his, and that he is not making money for someone else.

And It Gives Health

The second reason I want my boy to be a farmer is because it will give him health. The farmer sleeps eight hours or more each night, rises early breathes the pure air of the open country, and feels that he is every inch a man. He starts the day by going whistling about the barn instead of slinking down the street with a dinner pail in his hand, thru the dust and smoke-filled air of the city. The farmer also has the best of food, the cleanest and freshest of everything for his table. All these things give him health, envied by the rest of mankind.

The third reason for wanting my son to be a farmer is because it brings him closer to his God. The farmer daily watches the miracle of seed being transformed into fruit and flower. His work is always with the creatures of God's planning. He is surrounded by the beauties of nature. On every hand he sees the working of his Creator's plans, and the wisdom of this planning, which deepens his faith in the Almighty Hand which guides us all.—Mrs. Paul R. Weaver, Adams County, Pa.

Fertilize for Corn of Better Feeding Quality

Every Agricultural Experiment Station will tell you that sound, well-matured corn will produce more pounds of pork than soft or poorly developed ears.

Cut down the proportion of nubbins, poorly filled and soft ears in your crop by using a well-balanced fertilizer on every acre you plant this spring.

V-C Fertilizers for Corn are made to meet the need of the plant on the soils of your State. They give the corn plant an early start, uniform growth and produce sound, well-matured ears before frost.

V-C Fertilizers have an established reputation among corn growers for producing heavy yields of sound grain of high-feeding quality.

Ask your dealer for V-C Fertilizers made for Corn, or write

Write Our Agricultural Service Bureau about your problems of soils, fertilizers and crops. This service is free.

More Money from Your Crops

You can do it with seeds that are dependable—seeds that are of high germination and adapted to your soil. The work of preparing the land and planting is the same whether you use ordinary seed or pedigreed seed. But the crop tells the story; added profit—often double or triple—comes from using hardy, big-yielding, Michigan-grown, Isbell's seeds.

47 Years of Better Seeds

For nearly a half century, Isbell's have been developing yield, vitality and hardiness in seeds. Ceaseless experimenting, careful selection, better growing, sorting and cleaning methods have done this. 200,000 customers have proved this profit-building quality—they plant Isbell's seeds year after year and get bumper crops.

We grow our own seed—you buy direct from us, saving money and eliminating all risk of substitution.

Isbell's Valuable Book—FREE

Doctor Lipman's Weekly Talk on Soil Fertility Problems

Principles to Recognize When Growing Alfalfa

How should alfalfa be planted and how much seed is needed for an acre?

The successful growing of alfalfa calls for the recognition of the following principles:

1. The soil should be naturally well drained, or its drainage made satisfactory by artificial means. Gently sloping hillsides, consisting of a medium to heavy loam top soil and having a fairly open subsoil, are almost ideal sites for alfalfa.

2. Alfalfa is more exacting as to its lime requirement than other crops grown in the eastern United States, hence, the importance of applying sufficient lime prior to seeding down. The amounts of lime required will vary from nothing to an equivalent of three tons or more of ground limestone. Ordinarily an application of two tons of ground limestone per acre, or the equivalent of burned and slaked lime, is sufficient.

3. Late summer seeding has been found to give the best results in southern Pennsylvania, New Jersey and Delaware. On the slopes of the higher hills, or farther north especially, spring seeding is likely to prove more satisfactory. In that case, alfalfa is usually sown with a nurse crop of oats or barley.

4. It is important to have a mellow, clean seed bed for alfalfa. The crop may be preceded by oats, or by oats and Canada field peas, harvested for forage purposes. After the preceding crop is removed—preferably at the end of June or early in July—the land should be plowed at once and summer-fallowed until about the middle of August, when the seed bed should be ready for the alfalfa.

5. The fertilizer which has been found to give good results for alfalfa consists of acid phosphate or a mixture of acid phosphate and some potash salts. An application of 300 to 400 pounds of acid phosphate and 50 to 100 pounds of muriate of potash is good enough for most purposes. For heavier soils, the smaller application may be sufficient. Where alfalfa has not been grown before, inoculation is desirable. It is the common practice nowadays to inoculate the seed with some commercial culture of good quality.

The seed itself may be sown at the rate of twenty to twenty-two pounds per acre, preferably with a wheelbarrow seeder, altho there are now on the market satisfactory grass-seed drills that may be used for the purpose. It is essential to look into the source of the seed, for there is much difference in the quality of alfalfa seed. It comes from many places, some of it from the Mediterranean region in Europe. Successful alfalfa growers in the eastern United States have found that alfalfa seed derived from western Kansas usually produces good, vigorous alfalfa plants.—J. G. Lipman.

To Improve Field

I have a field of fifteen acres part limestone and mostly flinty soil with clay subsoil. I cannot now grow clover like I did twenty years ago. The field at present has been idle for two years and has a small covering of weeds. I want to apply lime this winter, plow weeds and lime down in spring, plant in corn with fertilizer, sow sweet clover at third time cultivating the corn. Is my plan all right or would you advise a better way to get this field back again? —O. D., Bedford Co., Pa.

The plan suggested in your letter is essentially sound. If manure is available, even tho it be at the rate of only five to six tons per acre, it would be desirable to spread it on the plowed ground in the spring and to work it into the surface prior to the planting of the corn. This would stimulate bacterial activities in the soil and would not only make for a larger corn crop, but would also create more favorable conditions for the growth of the sweet clover. At the time of the planting of the corn, commercial fertilizer should be applied for the sake both of the corn and the sweet clover.

A mixture containing about 4 per cent of ammonia, 10 to 12 per cent of phosphoric acid and 4 per cent of potash should give you good results if applied at the rate of 500 to 600 pounds per acre. The amount suggested is rather more generous than is usually employed for the purpose, but, in view of your efforts to improve the land, it would be justified.

Presumably the sweet clover may be used for pasture purposes early in the spring, or it might be allowed to grow up and made into hay. If it is your plan to provide for the further improvement of the fertility of the land, it would be desirable to plow under the sweet clover in the spring and to plant corn again. Sweet clover, or a mixture of sweet clover and alsike, might be sown in the second corn crop as suggested for the first crop.—J. G. Lipman.

Blight on Potatoes

Does dusting give as good results as spraying for blight on potatoes? On the cottonseed analysis it says nitrogen-free extracts twenty-six per cent. Does that mean that there is that much nitrogen (fertilizer) in each hundred pounds or is that nitrogen available? If not, what per cent would be available?—G. H. H., Armstrong County, Pa.

Experiments carried on in New Jersey show that in the last four years spraying for the control of late blight gave an average increase of sixty bushels per acre, while dusting gave, under the same conditions, an average increase of only nineteen bushels per acre. Similar results have been obtained in Pennsylvania.

When cottonseed meal is analyzed as a feed the results are reported in terms of crude protein, crude fat, crude fiber and nitrogen free extract. The last named represents mostly starch and similar products. The name itself indicates that nitrogen-free extract contains no nitrogen.

When analyzed as a fertilizer cottonseed meal is found to contain nitrogen, phosphorus and potassium. The average good grade of cottonseed meal contains the equivalent of seven per cent of nitrogen, three per cent of phosphoric acid and two per cent of potash.

The nitrogen in cottonseed meal is of a lower order of availability than is the nitrogen in dried blood, tankage or fish. The actual result obtained from cottonseed meal will vary with the soil, crop and season. Under average conditions in Pennsylvania nitrogen in cottonseed meal is only eighty to ninety per cent as efficient as a like quantity of nitrogen in a good grade of tankage.—J. G. Lipman.

SCOTT'S Soy Beans

A valuable general farm crop. For soil improvement alone they pay for themselves. Any farmer—anywhere—can grow Scott's Soybeans with profit. They make rich hay, pasture and nutritious silage and build up soil fertility. Will grow in poor soils.

We Handle More Early Varieties Than Any Other Distributor

We handle Soybeans in large quantities—know of the best producing sections—are familiar with the many different kinds for their best adaptation—and can render intelligent service. Scott's Soybeans are of highest quality and cost no more than the ordinary kind; and besides, WE PAY THE FREIGHT. Write today for your free copy of our new Seed Guide.

Solve Own Problems

THERE is no doubt whatever that one of the major economic problems of this generation is how to assure to agriculture a fair share in the national income. . . . I have said repeatedly and I reiterate that a substantial part of the farmer's problems must be solved on the farm. I say this with full understanding of the difficulties that face the individual. I know well what the farmer is up against in the shape of uncontrollable weather, diseases, limitations of soil and climate, slow business turnover and all the rest of it. I have been up against it. But the solution of this problem begins on the farm, nevertheless, even tho it does not end there.

It is essential to have the best possible adjustment of production to market requirements. . . . Reliable estimates of crop and livestock production, surveys of intentions to plant crops and to produce pigs, calves, and lambs, accurate reports on storage, movement and consumption—all these things comprise a vital background of information that gives the farmer of today great advantage in his planning.

Efficiency in Operation Essential

It is essential to have the utmost efficiency in farm operation. Every farm management study that has been made reveals a wide range in farm business organization and methods. On one side of a line fence is a man who organizes his business expertly, who plans ahead, who uses his labor to advantage, who gets high yields from his fields and his animals. On the other side of the fence his neighbor may worry along on a haphazard basis, his crop yields below par, his livestock more of a liability than an asset. One man turns out his product at half the cost of another. There is no formula under the sun that can guarantee the well-being of the inefficient producer. I mean this whole point to be applied in a reasonable way, but it looms large in the problem, nevertheless.—From the address of Secretary of Agriculture Jardine before the Illinois Agricultural Association.

Free Farming Course

THE attention of young men, desiring to take up the study of agriculture, is directed to The National Farm School, in Bucks County, Pennsylvania, near Philadelphia, a school which was founded twenty-nine years ago by Rabbi Joseph Krauskopf, and which stands today as a pioneer in a method of agricultural education that is being widely heralded as the type that will ultimately replace all other kinds of similar education.

The National Farm School lays stress on the education of the hand, as well as of the head. It gives to worthy lads, irrespective of creed, a three years' course of instruction, free of all charge to them for tuition, books, board, lodging and other necessities. The students are in residence at the school during the entire three-years' course.

The requirements for admission are: age, between 16 and 21; a common school education; physical, mental and moral health; and a sincere desire to make agriculture a life's work.

Those who are interested, may write for further information and an application blank to Mr. M. A. Kaufmann, Chairman of the Committee on Admissions, 1101 Market Street, Suite 809, Philadelphia, or direct to the School at Farm School, Bucks County, Pa. The new freshman class will be admitted April 8th. All applications are considered on their merit, and in the order in which they are received.

You can control this!

Root rot . and the heavy toll it takes out of the corn crop . . can be controlled!

ROOT rot . . and the heavy toll it takes out of the corn crop . . can be largely controlled.

Like every plant disease . . it has a cause . . a symptom . . and a cure.

Lack of available potash is one of the contributing causes. Some growers call it "potash hunger."

There are several symptoms! In some cases stalks reach *normal size* . . but the yield is low . . the ears are chaffy, starchy, and underdeveloped . . many plants die prematurely. These symptoms show *lack of available potash.*

In other cases the plants are *dwarfed.* If the plants are normal green a lack of phosphoric acid is indicated. In either dwarfed or normal sized plants . . by splitting the stalks lengthwise you can detect the purplish brown accumulations of iron compounds which appear in the joints. These iron accumulations also show *lack of available potash.*

When plants are *stunted* or *dwarfed* and the joints carry heavy accumulations of iron . . *both phosphoric acid and potash* are required.

To economically control root rot . . many growers and authorities agree that a properly balanced supply of fertilizer must be applied. So far as is known, root rot is of little importance when both phosphoric acid and potash are available in the soil.

This disease is widespread throughout the corn belt . . especially east of the Mississippi River. You can control it by using the *right* fertilizer . . preferably a high analysis fertilizer containing a good percentage of potash . . and by growing a resistant variety of corn.

NOTICE:—Root rot can be controlled but not "prevented" as previously announced in our advertisement

The Trend of the Markets

THE figures in the following table represent the approximate unweighted average prices of the commodities and grains specified. The prices are based upon quotations from the market page of Pennsylvania Farmer.

	This week	Last week	Month ago	Year ago
Butter, 92 score creamery extras (N. Y.)....	$ .43	$ .43	$ .45	$ .41
Eggs, fresh gathered extra firsts (N. Y.)....	.31¼	[illegible]	[illegible]	[illegible]
Chickens, live, by express (New York)......	.37	.36½	.32½	.32½
Potatoes, 150-lb sacks (Philadelphia)........	6.82½	6.82½	6.97½	1.35
Steers, good to choice (Lancaster)...........	...	[illegible]	[illegible]	[illegible]
Hay, Number 2 timothy, baled (Phila.).....	24.50	24.50	21.50	20.00
Wheat, No. 2 red winter (Philadelphia).....	1.78½	1.76¼	1.77½	1.90
Corn, No. 2 yellow (Philadelphia)...........	.77½	.78	.84	1.41
Oats, Number 2 white (Philadelphia)........	.51	.50¾	...	.64½

Sheep and Lambs—Sheep, $3@8; culls, $2@3; lambs, common to prime, $10@13.50; culls, $9@10.

Hogs steady; light to mediumweights, $13.75@14.25; pigs, $14@14.50; heavy hogs, $13@13.25; roughs, $10@10.25.

CHICAGO LIVESTOCK MARKET

Cattle—Compared with week ago: Fed steers and yearlings and fat she stock, 25@50c higher; in-between grades weighty steers and yearling heifers up most; extreme top weighty steers, $11.35; numerous loads, $10.75@11.25; long yearlings upward to $11.50; few above $10.75; little cattle remaining very scarce; canners and cutters strong to 25c up; bulls fully steady; choice shipping calves mostly 50c lower; light kinds to packers, $1.50 off. Week's bulk prices follow: Fed steers, $8.75@10.15; fat cows, $5@7; heifers, $7@8.50; canners and cutters, $3.65@4.35; veal calves, $11.50@13; stockers and feeders, $7.25@8.25.

Hogs—Light lights steady to 25c lower; 250@350-lb butchers, largely 11.50@11.80; bulk desirable 200@225-lb weights, $12@12.80; majority sorted 180 pounds down, $13@13.50; top on 140@170-lb averages, $13.50; packing sows, $9.75@10.50; bulk better killing pigs, $13@13.50; heavy-weight hogs, $11.40@11.95; medium, $11.80@12.95; light, $12@13.50; light lights, $12.25@13.65; packing sows, $9.75@10.50; slaughter pigs, $13.25@13.65.

Sheep—Compared with week ago: Fat lambs around $1.50 lower; feeding lambs, 75c@$1 off; fat sheep, $1@1.50 lower. Tops for week: Fat lambs, $13.85; feeding lambs, $14.25; yearling wethers, $12.75; fat ewes, $8.50. Bulk prices follow: fat lambs, $12.25@13.50; feeders, $12.75@13.50; yearling wethers, $10.50@11.85; fat ewes, $7.50@8.25.

WOOL MARKET

Boston, February 19, 1926.

Domestic—Ohio and Penna fleeces—Delaine, unwashed, 52@53c; ½-blood combing, 52c; ⅜-blood combing, 52c; fine unwashed, 45@46c. Mich and N Y fleeces—Delaine, unwashed, 48c; ½-blood combing, 49@50c; ⅜-blood combing, 51@52c; ¼-blood combing, 51@52c; fine unwashed, 45@46c. Wisconsin, Missouri and average New England—½-blood, 46@47c; ⅜-blood 48@49c; ¼-blood, 48c.

GRASS SEED—WHOLESALE PRICES

Toledo, Ohio, February 20, 1926.

Cloverseed, imported, $15.25; domestic, $20; February, $15.25; March, $15.30; October, $15.75 bid. Alsike, cash, $16.60; March, $16.75. Timothyseed, cash and February, $3.55; March, $3.57½.

Feed Prices

THE feed market has again turned weaker because of a continued lack of consuming demand, according to the United States Department of Agriculture. Recent cold weather in the New England States stimulated the demand slightly for a few days but buyers generally are taking only sufficient feed for their immediate needs which have been restricted materially by the large supply of low priced feed grains, including corn, oats and barley.

Mill offerings of wheat mill feeds are not heavy and mills are not pressing feed onto the market. Jobbers and brokers, however, have sufficient offerings for current needs and storage operators at Kansas City and other central western markets are reported to be carrying a considerable amount of bran in storage. Middlings have also become weaker with bran but the demand is becoming slightly more active as the spring pig feeding season approaches.

The low price of corn has resulted in heavy production of corn feeds. Prices of both gluten and hominy feed have declined and the market continues weak because of the small demand.

Stocks of linseed meal are relatively small and prices have held firm in the northwestern markets but have weakened in the eastern markets where the lack of export demand for linseed meal and cake and heavier offerings of cottonseed meal in competition with linseed meal have weakened the market. Stocks of cottonseed meal continue large and prices are at about the lowest point for the season. Quotations for shipment during March, April and May, however, have been advanced about $1 over spot quotations.

The supply of alfalfa meal appears ample for current needs and prices are holding fairly steady. Colorado mills are the most active producers at this time.

Butter Markets

REGULAR trading on the Philadelphia butter market was good and in some quarters continued policy of anticipating needs was shown. This was especially noticeable on 90 score and better and the market very firm at unchanged prices. Ninety score was in light supply and in a small way a half-cent premium was secured. Lower scores while not showing any accumulation were not in active demand.

CHEESE—The movement of a few long lines of Wisconsin summer flats at around 26c was the main feature of the wholesale market. Jobbing demand was fair but small lot business was the rule on all styles.

EGGS—Market firm. On the produce exchange, February 19, there was one sale firsts, new cases, 32c.

Boston Market

BUTTER — Market tone ruled steady on the 19th but the undertone appeared more unsettled the day before. The unsettledness is a result of the lack of buying interest on the part of large buyers in volumes beyond immediate needs. Jobbing and small trade was again reported to be good. Cars centralized generally slow sale. Some business on storage cars around 43½c.

CHEESE—A fair amount of jobbing business was reported generally. Sizeable block of single daisies sold at 24c. Young Americas received more call and sold down to 25½c. Fancy New York state twins held for full asking prices.

New York Market

BUTTER—With heavy offerings rather light and demand continuing active the market ruled firm. A heavy river fog delayed some butter and this, together with the fact that buyers were anticipating Monday holiday needs made the situation firm. In some instances premiums were paid but bulk of reported sales at listed prices. Some inquiry for fancy storage but general trade slow. Car market steady with only fair trade noted.

CHEESE—The market generally is quiet and buying interest is comparatively slow on all styles of cheese. The small lot movement of late shows prices well sustained and market rules in steady position on held goods. Dealers show little interest as a rule in further buying of held or fresh goods, and seem disposed to clear present stocks before taking on further supplies.

EGGS—Market about steady. On the Mercantile Exchange on the 19th there were three sales firsts at 31½c; one sale April refrigerator seconds, 24; extra firsts seller the 20th offered 35c, bid 32c; extra firsts seller seven days offered, 34½c, bid 30c; firsts, 31½@32½c; bid, 30½@31c; firsts seller next week, 31c; bid, 28½c; firsts seller 3 days, 32½c; bid, 28½c; firsts seller, Wednesday, 32c; bid, 28½c; refrigerator firsts, 27c; bid, 26c; April refrigerator seconds, 24½@26½c; bid, 23c; May refrigerator seconds, 24½c; no bid.

Chicago Market

BUTTER—On the 19th the market was barely steady with trade quiet. Buyers showed practically no interest on the top scores and only a small demand was reported on the medium and lower grades. Dealers were willing sellers on all grades and in some quarters buyers might have obtained slight concessions had they shown any interest. Centralized cars were also barely steady and buying interest was lacking except at concessions.

CHEESE—Business generally quiet with dealers free sellers on fresh and buyers showing but little interest. The tone of the market was unchanged with fresh cheese steady and cured firm.

EGGS—Market weak. On the Mercantile Exchange there were 3 sales on the 19th of fresh gathered firsts at 27½c; 3 sales fresh gathered firsts, Nebraska, 27½c; offerings fresh gathered firsts, 28@29c; bid, 27@27½c.

Philadelphia Markets

THE advance in celery prices was the feature of the Philadelphia fruit and vegetable market February 18th. Supplies of both California and Florida stock were light and the demand active. Pennsylvania celery was scarce and fancy stock sold at higher prices, according to the Pennsylvania and Federal Bureau of Markets.

Lettuce was not so plentiful and the market for Iceberg was slightly higher. Onions were dull and sweet potatoes were steady. Old cabbage and spinach were dull while white potatoes moved slowly. Pennsylvania round whites ranged from $6.75 to $6.85 per 150-pound sack. Florida strawberries were in limited supply and held steady. Offerings of fresh fruits and vegetables were in limited supply on the Philadelphia market February 19 but were generally sufficient for the demand. Trading was slow and the market dull on practically all commodities. Iceberg lettuce was stronger and new cabbage was weaker. Potatoes were dull and the demand was very slow. Pennsylvania round whites ranged from $6.75 to $6.85 per 150-pound sack. Sweet potatoes were dull and moved slowly. Pennsylvania mushrooms were not quite so plentiful and fancy stock was higher. Root crops were slow, with the exception of parsnips, which were a little stronger.—W. R. Whitacre.

County News and Comment

Adams County, Pa.—January was a very good winter month for getting work done. Now we have about twelve inches of snow. Many roads were closed by drifts. Main roads open for autos, on byroads sledding is best. Some trimming being done in orchards. Cattle are wintering fine and feed will hold out pretty good. Fat hogs scarce at 17c lb, shoats are scarce, too, with more sows to farrow this spring. Many farmers sold their wheat the past month at $1.80, which looks like a good sale. Prices: wheat, $1.75; corn, [illegible]; oats, 50c; milk, three per cent, $2.[illegible] eggs, 28c.—A. R., Feb. 16.

Allegheny County, Pa.—There is no shortage of snow here. Traveling for automobiles is very hard and on many roads impossible. Weather for most part has been pleasant, however, had some very, very cold and stormy days and nights. Outside work at a standstill. Stock wintering well, several farmers report that they will be well cleaned out of rough feed by the season's end.—C. K., Feb. 11.

Lawrence County, Pa.—Cold weather continues with strong winds. Snow covers the ground giving protection to wheat and rye. Little Lawrence suffers no effects from the coal strike, the enormous local mines supplying the demand. Fresh cows are in demand and prices high. The general cry is for Holsteins with the dairymen who sell the whole milk. While Jerseys and Guernseys are the pride of the butter makers. Robins are reported in many localities and partridges are plentiful where the weeds and seeds are abundant. Wheat is selling at $1.70; oats, 47c; rye, $1; buckwheat, $1.80; ear corn, 50c; butter, 50@60c; eggs, 50@55c; timothy hay goes slow at $15.50; clover, $18; straw, $11.—M. L. V., Jan. 27.

Lebanon County, Pa.—The two farms of the late Isaac Zug, bank president and horseman, who was one of the most widely known men in eastern Pennsylvania, were sold at private sale. One brought $85 an acre, the other, larger, with very large tobacco shed, $100 an acre. These farms consist of rich black loam and are the equal of anything in Lancaster County for raising corn, hay, wheat and tobacco. Most folks are done stripping tobacco and have it ready for sale. The heavy snows of the past few weeks drifted. Many roads have been and still are closed. Winter grain and grass profit by snow. Sale stock-yearling bulls bring $40 and up, potatoes $2.60 and other things are also selling high. Ice is still being harvested. The usual winter activity in pomological, agricultural and poultry, fish and game associations manifests itself in meetings where timely topics are discussed. Much wheat has been hauled at $1.80; corn brings, 85@90c for well dried; eggs, 30c; calves, live, 12c; oats, 45c; firewood, delivered, around $7 a load; fat bulls, 7c liveweight.—R. I. W., Feb. 17.

Lycoming County, Pa.—The weather so far this month has been very changeable with some cold spells which were below zero, making it very trying for outside work. Roads have been badly drifted in some places, making motor traffic yield to old Dobbin who once more played upon the dusty old "chimes." A present there is from a foot to eighteen inches of snow which is very well for protection of winter grains during cold weather. Fairly good returns are being realized from farm stock sales. Several farms are offered for sale but move slowly, but few changed hands in the past year. Potatoes selling at the farm for $1.75 a bushel, from retailer $2.50 a bushel. Eggs, 50@55c at store, paying farmer 25c; beef, by side, 12c; butter slightly higher, 55@60c; milk to condenseries fell off 4c cwt.—C. I. C., Feb. 15.

McKean County, Pa.—We have a good deep covering of snow and a great variety of weather with it. Pomona Grange held a very interesting meeting at the county seat, Wednesday. The county agent gave a talk on twenty different things a farmer should be doing this month or next. In McKean County, during the past year, seventeen different communities held program meetings and adopted a program for their particular community. Three bull associations were organized during this time. Some farmers are spending their spare time hauling lime. Some are hauling chemical wood. Eggs are still scarce. Good demand for milk. Prices: eggs, 45c; apples, $1.50; potatoes, $2.55; veal, 18c.—F. J. H., Feb. 15.

Mifflin County, Pa.—Had winter weather the past month. January passed out cold, February came in mild. On the third it snowed about fifteen or eighteen inches which drifted some, making it impossible to travel with autos on many roads. Many sleds were seen going on the roads and the old time sleigh bell gave it's chime to the public once more. A number of farmers are having lime burned in the neighborhood which they are hauling on their fields this winter. The state is offering a free cow testing for tuberculosis for a ninty-per-cent signup of cow owners. Our dealers shipped a load of cows a few weeks ago. Much stock in poor condition on account of improper feeding. Our dairyman is delivering extra good milk for 10c a quart; wheat, $1.60; corn, 80c; oats, 40c; butter, 50c; eggs, 34c.—J. H. B., Feb. 15.

Somerset County, Pa.—We are having real old fashioned winter weather; deep snow and zero weather. People living close to the state highways can get out all right but the ones a mile or farther away are snowed in now. January 28 and 29 was the coldest weather in 1926. People that have sugar camps are getting ready for sugar boiling but the camps are few and getting fewer every year. Prices for farm products good. Timothy hay, $18; wheat, $1.60; buckwheat, $1.50 cwt.; oats, 55c; eggs, 35c; country butter, 40c; creamery butter, 60c; milk, 3.5 per cent, $2.58 cwt. for December.—H. W. B., Feb. 11.

Susquehanna County, Pa.—The worst storm of the season is here and the roads are blocked; no mail for two days and milk being taken to station at Conklin, N. Y., every second day. The big truck is unable to make the trip so the farmers draw the milk by using two teams for each load and then it is an all-day job to draw it twenty-five miles. It has been useless to shovel roads as they would fill in again. Many farmers who thought last fall that they had plenty hay, say it is not holding out well and will be obliged to buy hay for cattle. A few ice houses filled. Potatoes continue to be very scarce and sell readily at $3. Eggs are plentiful and lower in price than last year. Good cows are very high on account of so many being taken by the T. B. test. Great demand for good firewood at $5 cord. Eggs, 32c; butter, 55c; chickens, 25c; hay, $15.—J. A. G., Feb. 12.

Union County, Pa.—Wheat has been well protected by snow for several weeks and it is needed as wheat went into winter with a thinner growth than usual. Many farmers are holding their wheat for $2. Very little corn or oats has been marketed in carload lots, so many farmers are feeding largely of these grains to make milk, buying only bran and oil and cottonseed meals to make a balanced ration. Farmers in this county are ready to have cattle tested for T. B. to know how they are, as some want to have sales and others want to move. Very few cows have been shipped in or out of the county during the winter. The Dairymen's League had very good meetings in Mifflinburg and in Lewisburg lately. The county agent is holding a series of institutes in different parts of the county and is planning experimental work for townships at the same time. The county fair will be held September 28 to October 1st. Tickets will be given free for one day of the fair to all school children up to the eighth grade in all the schools of the adjoining counties of Union, and the directors, with Hon. F. E. Brown, are trying to make this the greatest fair ever held in the county.—J. N. G., Feb. 12.

Lancaster Tobacco

THE buying of the 1925 crop of Pennsylvania tobacco has practically come to a standstill. Only here and there are buyers picking up a few isolated crops, at prices which are substantially the same as when the buying season opened.

The very best crops have continued to bring twelve cents per pound for the wrapper grades and two to three cents per pound for fillers. Crops of inferior quality have sold from seven cents up. This will average around ten cents for the tobacco sold thus far.

Growers are frankly in doubt as to what to do. Only forty per cent of the crop at the very outside has been sold, and every indication points to at least thirty-five or forty per cent of the 1925 leaf being left in the hands of the croppers. Either growers will have to pack their leaf themselves thru the agency of co-operative packing units, or will have to engage independent packers to handle it for them at a fixed price per pound. Unless the market should change very much for the better, the growers stand to lose either way.

The crop is said to be very good in quality, and is nearly all stripped. Growers who have sold are busy delivering their leaf as fast as the packers and the weather will permit.

Sentiment for a partial reduction of the crop next year is steadily growing in the ranks of the farmers in the face of the present slow market.—Garden Spot Farmer, February 18.

Prices and Prospects

TRADING in the large potato markets of the East was rather slow during the week ending February 17th. Supplies were ample to take care of the demand, and prices were a little lower at most points. During the latter part of the week the market showed a steadier tone but prices held at about the same levels. The first car of new potatoes from Florida arrived on the Philadelphia market on Wednesday. The variety was Spaulding Rose and altho they were small the demand was fairly good. Cuban potatoes were also offered earlier in the week.

Supplies of these new potatoes were too light and prices too high to affect the market for old stock. These first cars of new potatoes offered do not appear to enter into competition with old stock. They are bought largely by a different class of trade and may be considered as more or less of a luxury. The price they bring has little relationship to the price at which old potatoes are selling at the same time.

Last Year and This Year

Last year the first car of Florida Spaulding Rose arrived on February 28, at a time when Pennsylvania round whites were selling at $1.50 per 150-pound sack. This year the first car came into a market when Pennsylvania stock was selling at $7 per 150-pound sack and the price of the new potatoes was practically the same both years.

Reports from growers in late potato producing sections are optimistic and there is a danger that a much larger acreage will be planted this coming season. The over-production in 1924 was due largely to the exceptional average yield of 127 bushels per acre. The acreage that year was relatively low and if the yield had not exceeded all previous records, the crop woud have been marketed without much difficulty.

The record prices paid for the 1925 crop resulted from a reversal of conditions. There was a reduction of seven per cent in acreage and the average yield per acre was 103.8 bushels. This yield is about three bushels per acre above the average of the previous ten years. The fact that a yield of three bushels above the ten-year average was secured in a year when weather conditions were so unfavorable is remarkable. The Department of Agriculture in one of its reports attributes this increase to the use of better seed potatoes. While this is undoubtedly a factor that has tended to raise production, still in Pennsylvania, it seems likely that 400 Bushel Clubs, better spraying and cultural methods have done their share too.

The New York egg market was irregular during the early part of the week ending February 17th. The heavy snowfall during the early part of the week resulted in lighter receipts of nearby eggs. Prices advanced during this period and the demand was active for fancy grades. As the country roads became passable receipts increased and prices were forced downward. Reports of favorable weather in the western egg producing sections resulted in further price reductions at the close of the week. Nearby extra firsts were quoted at 36c to 37c on Wednesday and gathered firsts to extra firsts at 35c to 37c.

Egg Prices in Philadelphia

Conditions were much the same in Philadelphia with advancing prices and a firm feeling in the early part of the week and declining prices toward the close. On Wednesday, however, the decline stopped and the market was reported as firm with extra firsts selling at 33c per dozen and firsts at 31c.

Receipts of live fowl by express were light on the New York market during the week and prices held about steady. Broilers were in fairly good demand at steady to firm prices. Dressed fowl were in light receipt and the demand was slow. Receipts of dressed chickens were of irregular quality and the market was slightly weaker.

Good hay was firm during the week February 8-13 as a result of lighter receipts but the lower grades were practically unchanged. Heavy snows increased consumption in the Northeast but mild weather was curtailing farm feeding in the Central West. With the exception of the fourth week in December, the weather this winter has been generally mild and it appears that hay consumption has not been heavy. Timothy averaged firm for the week. The Philadelphia and Pittsburgh markets were practically unchanged. Receipts were light at New York and trucking was difficult on account of the snows. The demand was moderate and top grades were scarce and in demand.

Grain Markets Weak

Wheat prices declined during the week ending February 13th. Domestic milling demand was of small volume and prices of practically all classes of wheat at the close of the market on Thursday were six to eight cents lower than at the close of the previous week. The corn market declined slightly but a more active demand appeared to be developing at several markets. The oats market also weakened but the demand from feeders continued active.—W. R. Whitacre.

The Voice of the People

Harness in Use Forty Years

TO THE EDITOR:—I noticed in a recent issue an article in regard to the care of harness. I have a set of harness that has been in use for forty years and there is not a break in the main parts. True, where snaps or buckles work they have been worn thru and been repaired.

These harness were made by local men who had never learned the trade except as they took it up themselves. They were tanners. Tanned their own leather and began harness making by doing repair work. The harness have been kept in good repair and well oiled. My time of oiling is in the spring of the year after the mud dries up and before the dust comes.

Take Apart and Wash Thoroly

My plan is to take the harness apart and wash them thoroly in tepid water, using a little washing powder and a brush. Then I put my oil in a large kettle, keeping one side of the kettle next to the fire, thus keeping it warm; then I dip the harness and rub, rub, rub, hang up and frequently rub again. These harness have been used for farm work and hauling on the road.

I also have a pair of check lines that my father had made fifty-five years ago, and they are in perfect condition today. They are twenty-one feet long and seven-eighths inch wide. They were made to drive the front team on a wagon, when we drove four horses from the seat. They are not always in use, but are used whenever long lines are necessary. It pays to take care of harness.—S. C. George, Indiana County, Pa.

Baltimore Protects Oysters

TO THE EDITOR:—In reading Doctor Lipman's weekly talk in the January 30th issue of Pennsylvania Farmer I note the following statement: "The cities along our seacoast send their sewage directly to the sea. This is true of places like Boston, New York, Baltimore or San Francisco." I am well acquainted with conditions relative to Baltimore and know that one of the most modern sewage disposal plants in the country has been constructed on the outskirts of their city. This was done to protect the oyster industry in the Chesapeake Bay and such a statement as you have printed will lead your readers to question the safety of using Chesapeake Bay oysters. The septic tank, filtration, and chemical treatments given the Baltimore sewage renders the effluent discharged into the bay, or rather back river, an arm of the bay, less harmful than many of the farm water supplies used by your readers. —John R. Haswell, Agricultural Extension Engineer, Pennsylvania State College.

Proper Appraisal Needed

IN A statement to all owners of livestock and poultry who seek payment from the state for damages caused by dogs, Secretary of Agriculture, F. P. Willits, points out the need for proper appraisal of the damage by local authorities.

The Bureau of Animal Industry occasionally receives claims for alleged damages when the owner did not call upon the local appraisers for some time after the damage occurred and the livestock or poultry had been burned or otherwise disposed of. The law does not permit such claims to be paid. The only way compensation can be allowed is to have the local appraisers examine and appraise the killed or injured livestock or poultry immediately after the damage has occurred.

HILLPOT Quality BABY CHICKS

What is YOUR standard for judging chicks?

Is it sturdiness and vigor, which leads to EASE OF RAISING? G. F. Smith, FORT PLAIN, NEW YORK, writes, "I never before had experience with chickens, yet from 101 Hillpot Chicks I raised 97".

Is it HEAVY LAYING of WINTER EGGS? "My 75 pullets from Hillpot Chicks laid 1548 eggs in January. My record was 70%, while the Vineland Contest in the same month averaged only 30%." states Mrs. Georgianna Gilbert, MILLVILLE, NEW JERSEY.

Superior Quality of my Chicks is proved not by what I say, but by what my customers know. Decide now on my "PROVED CHICKS for '26". Send for my beautiful new chick book FREE. Contains full page illustrations in colors of the famous breeds, shows by customers' letters how to be sure of securing the most profitable strains of

Leghorns, Reds, Rocks, Wyandottes

Since old customers take up so much of my production, it will pay you to ORDER PROMPTLY. Safe delivery of Full Count Guaranteed

LAWRENCE P. UHL

THE OLDEST AND LARGEST INDIVIDUALLY OWNED AND OPERATED HATCHERY IN OHIO.

I am a PIONEER in the Baby Chick business. For 20 odd years I have been producing high class Baby Chicks which have gone out to thousands of Poultry people of America and proven highly satisfactory. For years previous to 1910, (when he retired), I was associated with M. Uhl, New Washington, Ohio, who was Father and originator of the Baby Chick business in Ohio making the first shipment of Baby Chicks 25 or more years ago. Since 1919 my output has been entirely taken by dealers who supplied a long line of year after year customers. I have decided to give the GENERAL PUBLIC an opportunity to buy my high class Chicks direct, from the Hatchery here at New Washington and I am in a position to furnish these excellent Chicks in almost any quantity and on short notice at the following prices:

For quick action, you can order, from this advertisement in perfect safety. Reference: Farmers State Bank, Duns or Bradstreet, Or get our free Catalog and further details as to prices on Chicks. Write your exact wants at once if you cannot make up your order from this price list. I want your business this season and you may rest assured that we will take care of you RIGHT.

RADIO DEPARTMENT

Conducted by

BRAINARD FOOTE

Explanation of Some of the Mysteries of Radio

THE mere fact of radio seems a miraculous mystery to nine listeners out of ten. To understand its workings seems impossible. However, one may acquire a knowledge of the fundamentals of radio quite easily and will find such information to be of inestimable value in getting the most out of his set.

We shall discuss the radio broadcast system under the following headings: 1, generating radio waves; 2, receiving radio waves; 3, wavelengths; 4, modulation; 5, detection.

The first essential to sending messages or broadcasts by radio is an aerial—a wire or a number of wires—suspended in the air. Next we must have a method of generating alternating current, which is electric current that changes its direction many times per second, first dashing one way and then turning about and dashing the other at a speed of 186,000 miles a second. Ordinary house current is usually alternating, but it doesn't alternate fast enough for radio. Instead of using a rotating machine to generate radio current (which is still done for certain transatlantic commercial code messages) a vacuum tube is employed.

What Oscillations Are

The tube sets up what are called oscillations and these are nothing but alternating current that goes back and forth many thousands of times a second. The oscillations are permitted to flow up and down in the aerial wires. The presence of electric current in the wires strains the surrounding area or space, into what is called a magnetic field, just as magnetism in a magnet causes its magnetic field. In the case of the magnet, the field is steady, but with our aerial, it changes along with the changing current. This magnetic field spreads farther out every time the current impulses flash up and down the aerial and thus we have a traveling magnetic field, which tears across country at 186,000 miles a second or fast enough to jump from New York to London in one-nineteenth of a second.

A broadcast listener's aerial sticks up in the air and the passing radio waves rub across it on their speedy journey. This reverses the process described for the sending aerial, and instead of the current causing the magnetic field or wave, here the magnetic wave causes current to flow in the listener's aerial. This electric current is alternating in the exact manner of the current at the other end, with the exception that the amount of current generated in the receiving aerial is so small that it is practically impossible even to measure it by the most delicate scientific instrument.

Selecting the Message Wanted

Now you may ask, "How is it possible to select the one radio message I wish to hear?" Well, this is accomplished by a process called tuning—which is much like that of adjusting a violin string to be in tune with a certain note of the piano. The generating machine or vacuum tube at the sending station can be regulated to produce alternating current of different frequencies. For example, that of station X generates approximately 970,000 cycles. Two alternations make up every cycle. Some stations generate current with higher frequency—up into the millions.

At the end of each cycle of station X's 970,000 that flash up and down the aerial each second, a magnetic field or wave departs from the aerial. At the following cycle, off goes another wave, and so on like a parade. The waves move along at 186,000 miles a second.

Since it is more convenient, mathematically, to use the metric system for radio calculations, scientists state that a radio wave moves along with a speed of 300,000,000 meters per second (the same as 186,000 miles). Now then, maybe you can do this one! If Y's aerial sends forth 970,000 waves every second and these waves travel 300,000,000 meters a second, how far apart are they? In other words, what is the distance in meters that separates one wave from the next one sent out?

Measuring Wavelengths

Just like a problem in grammar school 'rithmetic. Suppose 970,000 men leave a certain spot, all in one second, and they walk at the prodigious rate of 300,000,000 meters per second, how far apart are they? Why, simply 300,000,000 divided by 970,000, or 309 meters! And in radio, that distance between waves is called the wavelength. If you measured the distance from the crest of one wave of the ocean to the crest of the next one, that would be the wavelength.

And bear in mind the fact that if more waves come from the sending aerial in a second, they can't be so far apart and the wavelength is shorter. The short-wave stations around 250 meters send out millions of waves per second, whereas those 300 meters send out waves numbered in the hundreds of thousands.

The Process of Modulation

Modulation is the process of sending voice or music vibrations along with the radio broadcast waves. When no word is being spoken at the broadcast studio, nor any music being played, even tho the transmitter is going, all the current alternations are of the same strength. But a single syllable of a word varies the power applied from the batteries or dynamos to the sending vacuum tube and causes some of the oscillations or alterations to be powerful, some to be weak and others of moderate strength.

There are unlimited combinations possible, such as first a strong one, then a moderate one, next a weak one, next a moderate one, etc., that it is possible to vary the strength of the current impulses in the aerial and thus the strength of the radio wave in any conceivable fashion.

These varying waves, all of the same wavelength, of course, produce the effects of speech or music in that wave. By using a certain crystal or a tube connected in a special way and a telephone receiver at the receiving end, these current effects may be detected and reproduced in the exact imitation of what goes on at the studio.

Since the radio waves are means whereby the voice and music impulses ride to the receiving sets, broadcast waves are called carrier waves. Since the alternations of the sending current are so extremely rapid, you cannot hear them. There may be 1000 radio waves needed to carry to you the vowel "o" or a single note struck on a mandolin string. The vibrations of voice and music are so slow in comparison to those of the radio waves that human ears detect them, whereas the radio waves vibrate too fast for our sluggish eardrums.—B. F.

THIS winter, keep your horses fit and sound with Gombault's Caustic Balsam. Known for 42 years as a reliable and effective veterinary remedy for Spavin, Capped Hock, Curb, Splint, Grease, Thoroughpin, Quittor, Wind Galls, Poll Evil, Laryngitis, Fistula, Sprains, Barb Wire Cuts, Calk Wounds, Shoe Boils.

Leaves no scar or blemish. Keep a bottle of Gombault's Caustic Balsam on hand, always ready for emergencies. Apply it yourself—directions with bottle. $2.00 per bottle at druggists, or direct upon receipt of price.

The Lawrence-Williams Company
Cleveland, Ohio.

GOOD FOR HUMANS, TOO

GOMBAULT'S *Caustic* BALSAM

DOGS

SEND AN $8 OR $10 CHECK
to W. W. Norton, Ogdensburg, N. Y., and receive a Shepherd pup while they last. $25 check for a trained dog.

WORLD'S BEST RABBIT & FUR HUNTERS $30. B & T $25. Beagle $20. Female Dash $15. Skunk Hound Pups $5. Goldsboro Geatery, Mohnton, Pa.

PEDIGREED COLLIE PUPS—The handsome and intelligent kind. Also, Fox Terriers. LONDON KENNELS, Box No. 37, Grove City, Pa.

HELP WANTED

WANTED experienced farmer, married, with own help to operate on shares. 200 acres and lime grinder. Must be honest, dependable, good manager, able to handle farm machinery successfully. Well adapted to dairying, potato growing and general farming. Close to school, church, good markets and improved roads. Owner unable to work. Equipped with machinery and some stock. Ira C. Walker, Slippery Rock, Pa.

WANTED—Reliable agents for the Griffin Silo with its famous Continuous Door Front. Earn your silo by commissions. Exclusive territory—Sold c. o. d. or time payments. Write for big free catalogue. Griffin Lumber Company, Hudson Falls, N. Y.

AGENTS—WRITE FOR FREE SAMPLES. Sell Madison "Better-Made" Shirts for large Manufacturer direct to wearer. No capital or experience required. Many earn $100 weekly and bonus. Madison Shirts, 566 Broadway, New York.

AGENTS—Our new household cleaning device washes and dries windows, sweeps, cleans walls, scrubs, mops. Costs less than brooms. Over half profit. Write Harper Brush Works, 176 3rd St., Fairfield, Iowa.

HOUSEKEEPER for family of myself and 15 year old boy on small farm. Need not milk. Woman with child not rejected. J. P. Napp, R. D. 2, Middleburg, Snyder County, Pa.

SALESMEN—New invention beats vacuum sweeper and all its attachments. No electricity required. All complete only $2.95. Over half profit. Write O. P. Morgan, Mgr., 750 Grimes St., Fairfield, Iowa.

WE PAY $200 Monthly Salary, furnish car and expenses to introduce our guaranteed poultry and stock powders, cleaner, etc. Bigler Company X-718, Springfield, Ill.

WANTED—Salesmen with cars, interested in progressive feeding methods. Live farmers or veterinarians preferred. C. W. Beck, Hotel Ridgway, Camden, N. J.

FARM LANDS

SALEM COUNTY, N. J.—Dairy or truck farm, 93 acres, twenty miles to Philadelphia, milk shed, good corn and alfalfa district. Two miles to churches, milk depot and R. R., good ten-room house, telephone, soft water, plums, peaches, pears, apples. School bus, basement barn, 28 stanchions, box stalls, water bowls, De Laval milker, silo, horse barn; $10,000, part cash. Clement H. Bassett, Woodstown, N. J.

HOMESEEKERS—Send for free lists farms and land in any state; price, owner's names, addresses. Say what you want, and where. American Homefinder, Dept. E, West Lafayette, Ohio.

720 ACRES, fifteen miles from Raleigh, this farm worth eighty thousand dollars. Will sell for fifty thousand. P. A. Reavis, Raleigh, N. C.

66 ACRES for sale, 7 miles south of Allentown or Bethlehem. Great opportunity. Call or write. Mrs. Catharine Moyer, Centre Valley, Pa.

FARMS for sale in North Carolina. Write P. A. Reavis, Realtor, Raleigh, N. C.

TOBACCO

HOMESPUN TOBACCO—Chewing five lbs. $1.50; ten, $2.50; smoking five lbs. $1.25; ten $2; cigars $2 for 50, guaranteed, pay when received, pipe free. Roy Carlton, Maxon Mills, Kentucky.

HOMESPUN TOBACCO—Chewing, five pounds, $1.50; 10, $2.50. Smoking ten $1.50. Satisfaction guaranteed. Pay when received. United Farmers, Bardwell, Kentucky.

HOMESPUN chewing or smoking tobacco—5 lbs. $1.25, ten $2, twenty $3.50. Satisfaction guaranteed. United Farmers, Paducah, Ky.

BARRED ROCKS

PENNSYLVANIA Certified Barred Plymouth Rock Baby Chicks. Hatching eggs. Marcus A. McKnight, Carlisle, Pa.

BARRED ROCK COCKERELS, farm raised. No disease, $3.00 each. W. H. Cooley, Albion, Pa.

Veterinary

Conducted by Dr. J. F. Shigley

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We invite readers to make use of this service. Clippings from the column when properly preserved and classified, make one of the most valuable medical symposiums a farmer-stockman can obtain.

COW FAILS TO COME IN HEAT.—I have a Jersey cow that had her fifth calf last April and has not been in heat since. Is there anything I can do to bring her in heat? Now people tell me it will not pay me to keep her should she get with calf that she would be dry five or six months. It may sound foolish but I am willing to feed her that long as she is the best butter cow I ever had and I only keep one or two cows and it might be a long time till I can get one like her. She seems to be in good condition and gives about twelve quarts of milk daily. Do you think she will get with calf again and what can I do to make her come in heat?—J. F., Hamburg, Pa. Failure to come in heat may be due to the presence of a corpus luteum in the ovary. Such a body appears each time the animal is in heat and normally disappears if the animal does not become pregnant or at the termination of pregnancy. Your veterinarian can make an examination and if a corpus luteum is present it can be removed. Heat is usually evident from three to five days after such treatment.

DIAGNOSIS OF PREGNANCY.—I have a cow that freshened last September and she does not come in heat, at least I have no record of her being bred. How could I find out whether or not she is bred and if not, what treatment should she have? She is milking about twenty pounds of milk per day now?—A. L. H., Doylestown, Pa. Pregnancy may be diagnosed by absence of heat, change in manner of animal, appearance of sleek coat and increase in size. To be certain of the status of the animal, you should have your veterinarian make an examination for pregnancy. This will save time for you and is the most satisfactory plan of handling cases of this sort.

DIET FOR LAMBS.—We have a large flock of sheep and among them are two ewes which only give milk in one side of udder. They each bring fine lambs. I was forced to feed them on cows' milk last year but it didn't agree with them. Please advise on how to raise them.—J. G., Conowingo, Md. From your description of the condition of the udders of the ewes, it may be possible that this is the cause of your troubles in feeding instead of the cow's milk. It has been our policy to bottle feed lambs on the whole milk beginning with two to four ounces of warm milk and increasing the amount as the lambs grow. The milk should be warm and the lambs fed every two to four hours at first, later three or four times daily. As the combination of cow's milk and ewe's milk has not been satisfactory would advise to raise the lambs on cow's milk alone.

LEG BLEEDS WHEN EXERCISED.—I have owned a saddle mare for over a year that has the scratches or cracked heels. Altho I have bought horses before that had them and cured the trouble, this case seems incurable. She has good care and a very dry clean stable and at times they seem healed up, but as soon as she is run hard they open up and bleed again. I have tried several good remedies for scratches but they always seem to open up. Would you kindly give me any useful information about them.—K. W., Rio, N. Y. It will probably be necessary for your veterinarian to apply the proper antiseptics under a bandage as an aid in complete healing. If the tissue is thickened as a result of the continued irritation some of this may be removed to lessen the danger of cracking when horse is exercised. Daily application of zinc oxide ointment after wiping the affected parts dry, may be helpful.

Our Readers' Classified Advertising Department

A market place to buy or sell at little expense. Over 80,000 farm families read Pennsylvania Farmer every week. Rate 8 cents a word each for one, two or three consecutive weekly insertions; 5 cents a word each for four or more insertions. Count each number and initial and send cash with order. Orders, discontinuances or changes of copy must reach us by Wednesday of week preceding date of issue. All advertisements set in uniform style, no display type or illustrations. Poultry advertising may run here, but if displayed or illustrations used must run in display advertising columns at commercial advertising rate (55 cents per agate line). Livestock advertising not accepted in this department. Minimum, ten words.

CHICKS—White Leghorns of carefully selected stock. Circular free. Twin Hatchery, McAlisterville, Pa.

WYANDOTTES

BARRON'S White Wyandotte cockerels $4 up, from stock 1 imported direct from Tom Barron, England. Records 282 to 313 eggs. Eggs for hatching. E. E. Lewis, Apalachin, N. Y.

SILVER LACED WYANDOTTE COCKS $8.00; cockerels $5.00; laying pullets and hens $2.00 each. John Stultz, Orrtanna, Pa.

WHITE WYANDOTTES—Barron 282, 275 egg strain. Fifteen eggs $2.00. Postpaid. Merrill Pease, Bowmansdale, Pa.

RABBITS

BELGIAN HARES
$5.00, $6.00 and $7.00 per pair.
M. T. PAYNE, 204 S. 2nd St., VINELAND, N. J.

Make every acre do its best

Is your farm giving you all it can be made to give you, the biggest yields, the most profit? Is every acre doing its best?

Not unless you are using enough fertilizer—fertilizer adapted to your crops and soils.

For maximum crops there must be enough plantfood in the soil or fertilizer added to feed each plant all that it needs. There must be enough to thoroughly nourish a perfect stand.

How much plantfood?

Do you know how much fertilizer you should add for each crop? Do you know the different kinds and amounts of plantfood each crop needs for maximum growth?

Years of careful experimentation by Agricultural Experiment Stations have developed valuable information as to the kind and amount of plantfood best suited to the soils and crops in their states.

Swift & Company knows these results. Such information combined with their own knowledge gained through many years of research and experience, is used by Swift & Company's large staff of fertilizer experts to arrive at their recommendations, given in detail below.

Red Steer Fertilizers are made right. The fifty-year reputation of Swift & Company for making each product the best of its kind is jealously guarded.

See the A. S. A.

Make every acre do its best. Get the right fertilizer—Red Steer. And give each acre the most profitable amount.

Near you is a man who will help you do it—the A. S. A. (Authorized Swift Agent). Through co-operation with your State Experiment Station, County Agent, and Swift & Company, he is able to make valuable recommendations to you.

He can show you how to cut your fertilizer costs by using a liberal application of Red Steer Fertilizer of high analysis. Go to see him. Look for the sign that marks his place of business—the sign of Quality and Service.

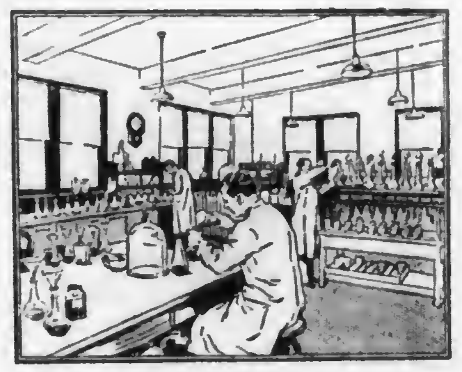
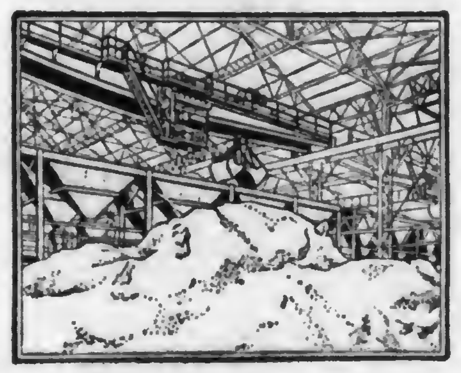
Authorized Swift Agent
SWIFT'S
RED STEER BRAND
FERTILIZERS
IT PAYS TO USE THEM

Swift & Company
Fertilizer Works, Dept. 12
BALTIMORE, MD. CLEVELAND, O.
HAMMOND, IND.



Swift & Company maintains a large staff of expert chemists, practical agriculturists and experienced factory men to produce fertilizers that will give you the best results in crops and profits



It takes months to cure fertilizers. After thorough mixing by special machinery, Red Steer Fertilizers are piled away to cure. Months later, the hard mass is broken up, reground and reprocessed. Because they are thoroughly cured they will not cake again

Swift's Red Steer Fertilizers
"It Pays to Use Them"

Fertilizers for Pennsylvania

The Pennsylvania Agricultural Experiment Station, after years of research and actual field experiments, has selected the following analyses of fertilizers for their soils and crops:

Corn. No manure or clover sod, poor soil, 2-12-4, 3-10-6. Medium soil, 0-12-6; rich soil, 0-16-0; with manure or clover sod, poor soil 2-12-4, 0-16-0. Medium or rich soils, 0-16-0.

Potatoes. No manure or clover sod, poor soils, 3-10-6; medium soils 2-12-4, 3-10-6. Rich soils, 2-12-4. With manure or clover sod, poor soils 3-10-6, 2-12-4; medium soils, 2-12-4; rich soils 0-16-0.

Vegetables (leaf crops). No manure or clover sod, medium or rich soils, 6-8-4, 4-8-4; with manure or clover sod, medium soils 4-12-4, 4-12-0; rich soils, 4-12-4, 4-12-0, 0-16-0.

Tomatos, peppers, cucumbers, melons, egg plant. No manure or clover sod, all soils, 6-8-4, 4-8-4; with manure or clover sod, poor or medium soils, 4-12-4, rich soils 4-12-4, 4-12-0, 0-16-0.

Vegetables (root crops). No manure or clover sod, poor soils, 5-10-5, 4-8-6. Medium soils, 4-12-4, 4-8-6; rich soils, 4-12-4. With manure or clover sod, poor soils, 5-10-5, 4-12-4; medium soils 4-12-4, 2-12-4; rich soils 3-8-3, 0-16-0.

PENNSYLVANIA FARMER
AGRICULTURE THE KEYSTONE OF NATIONAL PROSPERITY
ESTABLISHED 1880
PUBLISHED WEEKLY
(Pittsburgh Market Edition)
Vol. 93—No. 10 PHILADELPHIA, PA., SATURDAY, MARCH 6, 1926 $1.00 a year

In this issue: Only a few of the many interesting letters received from readers telling "What I would do with $1000." See page three.

The Market's Greatest Examples of Value-Giving

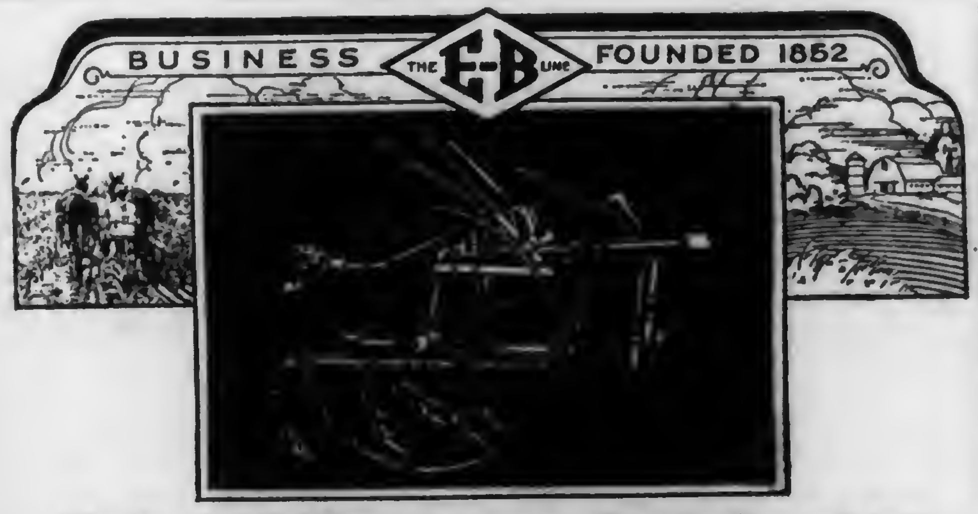
In far finer performance, in looks, in rugged construction and in thorough quality, these Nash Special Six, Advanced Six, and Ajax models—*at their attractively low prices*—are easily the value-leaders of their respective fields.

There are nowhere cars at a like price to match them in smooth, quiet performance, in trigger-quick getaway, in pulling power thru heavy going, or in supremely capable roadability thruout the full range of speed and power.

And they are roomy, comfortable cars. For Nash has exerted particular care in creating a body design that provides the maximum amount of seat space and leg room for all five passengers.

The fittings and appointments are of choice character and included, *at no extra cost*, among the major features of all Nash-Ajax models are 4-wheel brakes, full balloon tires and five disc wheels.

There are sixteen models included in the Nash-Ajax line and prices f. o. b. factory extend from $865 to $2090. (3085)



E-B All Purpose Cultivator

The E-B Pivot Axle Cultivator can be changed from the setting required for corn to that necessary for cultivating cabbage without using a wrench. That's how handy the various lever adjustments are. A master lever is provided, so both gangs can be raised or lowered at once, yet each gang can be controlled independently of the other for clearing trash, or changing depth.

A small lever changes the distance between the gangs for wide or narrow cultivation. An adjustable arch sets the wheels for wide or narrow rows. Another lever adjusts the back and front shovels to the same depth. Such handy adjustments as these make this cultivator popular.

And this E-B Cultivator is of the wheel guide gang shift type, operated easily by foot pedals. The gangs always remain parallel and shovels always face squarely forward, so every inch of soil is thoroughly and evenly cultivated.

High wheels with wide tires and magazine axle bearings insure light draft. Find out more about this E-B 48 Cultivator by filling out and mailing the coupon below.

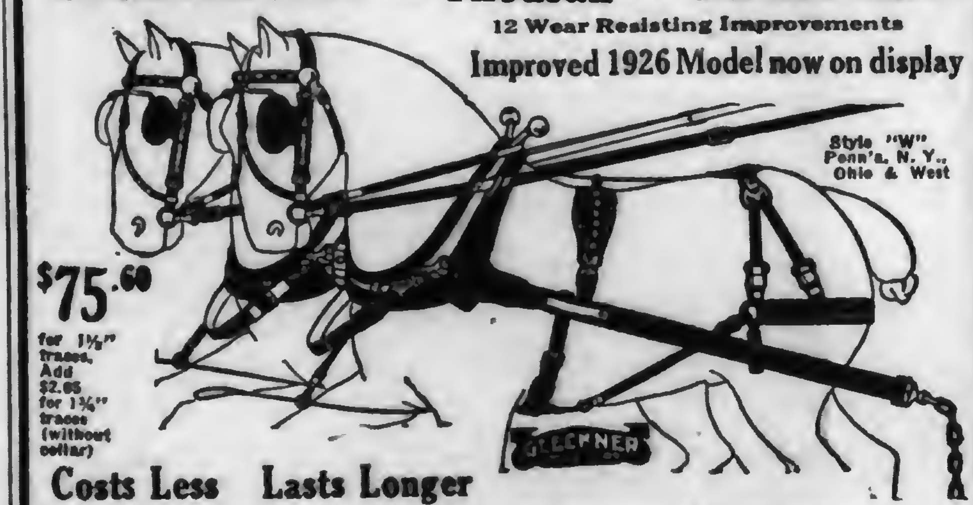
GLECKNER 1000 Thousan 1000 HARNESS
12 Wear Resisting Improvements
Improved 1926 Model now on display



Style "W" Penn'a, N. Y., Ohio & West
GLECKNER

$75.60 for 1½" traces. Add $2.05 for 1¾" traces (without collar)

Costs Less Lasts Longer

GLECKNER "Thousan" is the most satisfactory Harness you can buy—costs less, wears longer. For forty-seven (47) years the GLECKNER family has made only quality Harness. Every "side" of leather individually selected, every harness part made by hand except where machines do superior work, best waxed linen thread, lock-stitching done by machines to insure uniformity, strength and long life.

GLECKNER "Thousan" is our new standardized Harness, made in large lots, which reduces cost to you. It's made full size, easy to adjust, extra reinforcements absorb the strain where pulls are greatest.

SIGN of the Gleckner Dealer

Go to the GLECKNER Dealer near you and examine it, ask about the GLECKNER Guarantee that goes with each set. He will help to fit the harness to your horses. He is always ready to serve you and keeps in stock extra parts for your convenience. No letters to write, no red tape, no delay.

FREE—Send for Booklet with full information about the 12 Wear-Resisting Improvements, and name of nearest GLECKNER Dealer.

"What I Would Do with $1000"

Interesting Letters from Readers Telling How They'd Make Dreams Come True

Contest Editor's Note:—After hours of the most careful sorting, the judges of this contest counted the letters they had put aside for publication and found they had several times as many as could be printed in one issue. There are other letters fully as interesting as those published on this page, but we plan to use as many of them as possible in future issues.

ONE WHO PUTS FIRST THINGS FIRST

Awarded Prize of Five Dollars

THERE is no doubt whatever as to what I would do with one thousand dollars. I would install electricity in my farm home, and buy an electric washer, mangle, iron, fireless cooker and vacuum cleaner, together with the lighting fixtures.

I am the mother of three babies and am a firm believer in the fact that my first duty is to my children and that I should not spend all my time in drudgery, keeping clean (which no doubt is very necessary in the raising of a family) but I feel a mother's personal contact is primary.

"Losing your life for others," is one of the fundamental teachings of Christ—but he did not mean killing yourself with drudgery and slavery." I can "lose my life" sooner living for my children and teaching them God's wonderful work thru Nature than by slaving getting three meals a day, keeping a clean house and washing clothes in the wood-burning, broom back-breaking, hand-rubbing way.

May Be Rank Heresy, But—

I am a good farmer's wife as well as a farmer's good wife and I suppose that spending one thousand dollars on the house is rank heresy, but labor saving devices belong in the home as well as the barn.

The home atmosphere is the basis of the spiritual raising of a family and the mother is chief controller of that atmosphere. If she is bowed down by the drudgery which electricity will lift, the home does not get the best, which it deserves.

Therefore, if I had one thousand dollars I would install electricity and buy its appliances.—Mrs. W. S. F., Montgomery County, Pa.

HE WOULD DRIVE AWAY THE WOLF

IF I HAD $1000 I would first pay the grocer's, butcher's and all other bills up to date, then buy one month's supply ahead. Oh, what a grand and glorious feeling to be out of debt once when you have been just one jump ahead of the wolf for some time.

Then if I had enough left I would buy the woman and girls hats, dresses, shoes, etc. The boys would come next. If after all this was done I still had some cash left I would buy myself a new pipe.—J. E. T., Otsego County, N. Y.

REMEMBERS HIS MOTHER'S TEACHINGS

MANY times during the lifetime of my mother I have heard her quote an old German proverb which says, "A liar and a thief are sure to get caught." That expression made a deep impression on my mind, so much so, that today I believe that a person who does not pay his bills is just as much a thief as if he were to break into and rob a dwelling. Therefore, if I had $1000 the first thing I would do with it would be to pay off my miscellaneous debts such as feed, fertilizer, minor repairs, taxes, etc.

After paying my miscellaneous honest debts I figure that I would have about $650 left I would next have the house wired and connected up with my nearest power line (500 yards away). I mention the installation of electricity rather than of a water system because we already have hot and cold running water in the house, and we have our electric iron and vacuum cleaner standing idle ever since we left the city several years ago.

I believe there would still be enough of the $1000 left so that I could improve the farm by building a silo. I need a silo and need it badly. With it I could cut down on my feed costs as well as labor costs.

Finally, if there were any of the $1000 left, I would spend it for flowers with which to beautify the home grounds.—H. R. M., Luzerne County, Pa.

WOULD MAKE BIG SACRIFICES FOR A HOME

IF I HAD $1000 I should put it in a home of our own as soon as I could get it there. My husband has gone to look at a farm today but if we buy it we shall have a struggle to pay for it.

My husband is a hired man and his salary does not allow much saving after the expenses for three children and ourselves are paid. We have saved some and fully intend to buy a home even tho it means work and saving, because we feel that we need a home of our own and our boy especially needs to have a father who can be with him a part of the time.

We shall work hard but shall take a day off once in a while for play. We like the people where we work—have been here eight years in all. We have set out rose bushes and other flowers, but how nice it would be to set them in our own yard! I hate moving but I hope we find a place to buy.—E. M. E., Susquehanna County, Pa.

Now It Is the Men's Turn

LAST week we asked our women readers to write us about the things their husbands do that hurt, exasperate or offend them. This week we ask the men to tell about some of the things their wives do that make them go out and slam the door and kick the cat and jab an elbow into the ribs of the first cow that doesn't step around right lively. Perhaps the Better Half bosses her husband before company, or worries because she cannot afford as good clothes as Mrs. So-and-so, or pares her corns with his best razor, or never "dresses up" except when there is company or she is going somewhere.

Pennsylvania Farmer will give a prize of $5.00 for the best letter on this subject:

Things I Wish My Wife Wouldn't Do.

Others letters which are published will be paid for at space rates. Writers may sign a pen name to be used if their letters are published.

Letters should not be longer than 300 words and should be in our hands by March 20th. Address them to WEEKLY CONTEST EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

THE STORY OF TWO MOTHERS

I AM glad that there are no strings attached to this money. I am going to tell exactly what I would do with $1000 if I had it today.

I have a daughter who married one of those English war heroes. We considered that this daughter had made a good match. He had very exalted ideas of business and things. Soon after this union it was found out that this young man had formed some very bad habits.

Now this excellent, well-educated wife is in a city three thousand miles away and in destitute circumstances. This young man left his wife and two small children and ran away with another man's wife, by whom he has a baby.

His wife was left at home, destitute. Recently her baby became dangerously ill and was taken to the hospital, and for weeks its little life was despaired of. The faithful mother even submitted to the transfusion of her own blood.

If I had the half of $1000 I'd bring her back to our home where she can have rest and enough to eat. She has had no new clothing since she was married while the husband was gambling his money away.

Again, I know an excellent young woman. She married a man who was a revenue officer in Canada. She became the mother of five fine children. The husband lost his position because several offices were consolidated. Times were hard in Canada. Poverty came in at the door and this dear girl kept her trouble to herself. Her husband became sick, afflicted with that awful disease called diabetes.

I opened my home for this mother and her five children. A sister paid her transportation. The sick husband went to his parent's home. After providing for her and the children for one year a little home has been provided for her in the city where the husband's father lives.

They are in dire poverty, but she is bravely struggling on and she is sending two or three of the children to school. She will soon be a widow, and she is facing the probems confronting her. If I had $1000 I would use a part of it to help this woman to help herself.

This mother is a stenographer and bookkeeper, has taught school and is a fine cook, having attended a school of domestic science. I never saw any one more courageous and more deserving.

If I had $1000 I don't think I could make a better investment than to assist these two struggling mothers.—R. A. B., Chautauqua County, N. Y.

THE AMBITION OF A CHILD

IF I HAD one thousand dollars, what would I do? I would go to town and go to some big store and buy as many peanuts as I could buy with it. I could buy, let me see, oh, one hundred packages of peanuts at ten cents a pack. I would go home, sit down and eat a lot of them. That is what I would do. When you find that I win please send my five dollars to ————, Washington County, Pa.

P.S. That is my real name. My age is ten.

"SHOULD" AND "WOULD" AREN'T THE SAME!

WHAT would I do with $1000? Well, that is hardly a fair question. I would much rather say what I SHOULD do with $1000, or still better what YOU SHOULD do with that enormous amount of money; because I am firmly convinced of the truth of Shakespeare's philosophy that it is much easier to tell others what should be done than to do it oneself.

I am going to tell you first what I SHOULD do with $1000. In the small town where I live we are very much in need of a new school building, so in order to start the ball rolling I should head a subscription list for this school with my thousand, or at least buy that many bonds for the same purpose.

I recognize my duty fully, but I have different aspirations than to become the eccentric, old maid philanthropist of our town. My greatest wish just now is for a fur coat, so if I were to get that thousand within the next month, $500 of it at least would go for that coat, (to page 28)

Satisfied with your crop production?

If not, perhaps your soil is too acid. Use lime—it acts as a base, neutralizes the acid, and your crops boom.

Satisfied with your Boot Service?

You will be, if you wear Goodrich Hi-Press. Millions of farmers wouldn't think of wearing anything else. Fifty years' experience and Goodrich unvarying quality bring you the best boot service money can buy.

Goodrich HI-PRESS *Rubber Footwear*

THE B. F. GOODRICH RUBBER COMPANY, *Akron, Ohio*

NESHAMINY GARDENS

Where an Editor Works and Thinks

By R. P. KESTER

TODAY, February 22, is George Washington's birthday and a great many people are celebrating it by not working. It is a strange custom men have, that of ceasing to do any useful labor on the birthdays of great men, ostensibly that they may give undivided attention to the business of honoring, but too often we find them spending it in self-gratification. There are certain well-known signs of a holiday to be seen in a city. Flags are displayed, special dinners are advertised, theaters, movies and other amusement places sell tickets at advanced rates. In addition, each day has something especially significant of the man honored (?). Today toy hatchets and candy cherries are displayed in store windows.

* * *

CERTAIN historians in their endeavor to emulate Washington and tell the truth have been at work trying to demolish the chief things that most people know about George Washington. They tell us that Weems, the first biographer of the Father of his Country, was a very imaginative man and did not always limit himself to known facts. In order to make an interesting book he wove in many little tales, such as the cherry tree incident, the colt riding story, and the prayer at Valley Forge. But, as with most people, the denial of the beautiful incidents does not take them out of my mind. Having learned them as a little boy I shall go on believing them to the end of my days; first, because they are firmly established and, secondly, because I want to believe them. You will find in these two reasons the explanation for most of the beliefs which all of us hold about many things.

* * *

ONE of the most helpful things in relation to the human race is that it applauds the tender and beautiful things in life, even tho it does not always practice them. So, we want to believe that Washington told the truth about the cherry tree and that he did kneel in the snow at Valley Forge and pray for strength and wisdom during those dark days, and we are better for believing them.

* * *

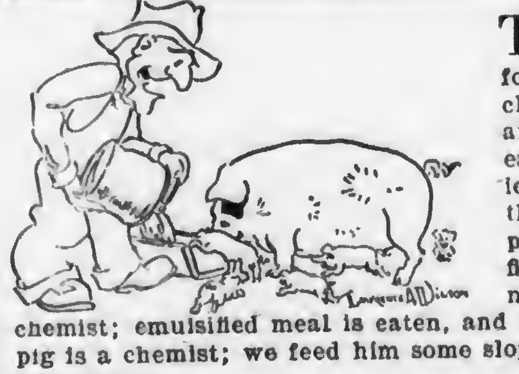
TO FINISH out this article with other unimportant comments I will relate a little cherry tree story of my own. When I was ten or twelve years of age father got me a little ax. I had been teasing for one a good while, saying that I would not only carry in the wood and kindling but would help cut it if I could have an ax suited to my size. Father's ax was too heavy, being a double-bitted one of regular woodsman's size. My parents argued against it a good while, saying I was too young and would cut my feet. However, father surprised me one day by bringing home a little ax exactly like his but weighing only half as much. I could scarcely wait to eat my dinner before setting forth to cut down a wild cherry tree down in the pasture, long marked as the first job if I should get an ax. I had made a few strokes, possibly three, when the ax glanced and came down on the side of my foot, cutting thru the boot and into the side of my big toe. A chip had stuck on the bit and caused the ax to glance downward. I was scared half to death, not at the seriousness of the wound, but because I feared they would take my ax away from me. As I went crying up to the house I thought of several possible tales as excuses, but I remember vividly how the lately learned story of George Washington came to my mind and I told father just how it happened. Mother was for putting the ax away, but father said, "That's the only way he will learn. He'll not do that trick again." And I haven't. Whether the George Washington story of the cherry tree is true or not it prevented me from telling a lie on that occasion.

* * *

MY INTEREST in planting things begins to rise anew about this time of year and everything dealing with fruits, vegetables and flowers is read with renewed interest. It is one of the evidences of the truth in Pope's declaration that hope springs eternal in the human breast. Those who possess the true farmer mind are able to look ahead and visualize the harvest that is to be. But there is more than that in it. Such a one enjoys in anticipation the work of planning and preparing to make the dreams come true. The real farmer is a combination of poet, prophet, artist and day laborer. If you doubt this, re-read the articles from the fathers and mothers who tell why they want their son to be a farmer printed last week. The other kind give their sentiments this week.

THE CHEERFUL PLOWMAN

Pig Chemistry



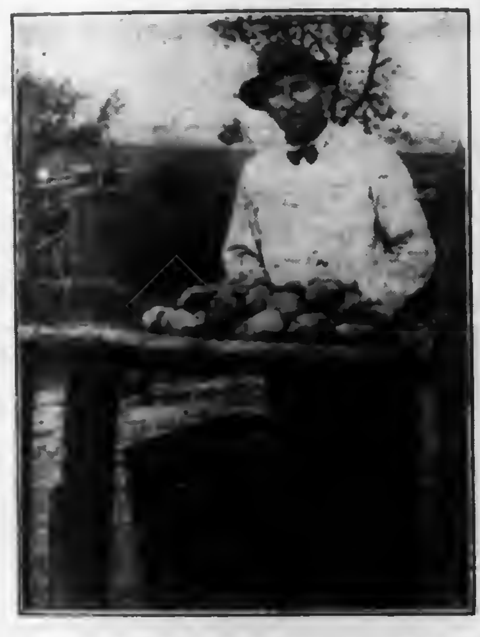
THIS pig is a chemist! He gobbles some rye, and zip,—it is bacon for humans to buy! This pig is a chemist; he swallows some wheat, and zip,—it is sirloin for humans to eat! This pig is a chemist; he masticates oats, and zip,—they are bristles for brushing our coats! This pig is a chemist; some barley he finds, and zip,—it is altered and made into rinds! This pig is a chemist; emulsified meal is eaten, and zip,—in an hour it is squeal! This pig is a chemist; we feed him some slops, and zip,—the dishwater is made into chops!

This pig is a chemist; he gets in the peas,—they go to his head in the form of head-cheese! This pig is a chemist; the spelts on his card he stows away neatly and makes into lard! This pig is a chemist; the bran that he chews he makes into leather for two-dollar shoes! This pig is a chemist; the middlings he crams are handled with science and made into hams! This pig is a chemist; warm water and shorts are made into short-ribs of various sorts!

This pig is a chemist; alfalfa and corn are taken for breakfast on Saturday morn, and zip,—on a Sunday before it is night, the corn, it is liver, alfalfa is light! This pig is a chemist; he's nothing but that,—a scientist busy at turning out fat; his laboratory has all that it needs for making good pork from inferior feeds; bring in the raw product, he'll do all the rest; he'll change it to meat of the sweetest and best!—J. Edw. Tufft.

Cutting Seed Potatoes

POSSIBLY there is no job in the spring which is as tedious as cutting a quantity of seed potatoes. Machines are on the market for doing the work and some growers use them with entire satisfaction but Blaine Lehman, Franklin County, Penna., who grew a forty-acre patch last year which yielded 8000 bushels of potatoes, prefers to hand-cut his seed. He has worked out a plan whereby one man in a day can cut from sixty to seventy bushels, which helps a lot when the planter must be kept going.



Mr. Lehman and the simple device that hastened a tedious spring job.

His first plan was to have a slanting table of convenient height, such as is shown in the picture, and with it he could cut up to fifty-five bushels a day. Just in front of him he fastened a thin bladed paring knife in a piece of soft white pine board, cutting edge away from him. Taking a potato in his hand he draws it toward himself and lets the cut pieces fall into the crates below. This does away with waste effort reaching for potatoes and tossing the cut pieces into a container which is far too common in the usual farm practice of this yearly job.

Chute Reduces Labor

Last spring Mr. Lehman even improved on the above plan by building a chute from his barn floor to the cutting table on the ground floor. He now can dump, from a wagon, thirty bushels of potatoes into the chute and eliminate the time and effort formerly taken to put the seed onto the cutting table. The same wagon can back up to the table and load the crates of cut seed to go to the field. In this way handling the tubers, which is no easy all-day job, is reduced to a minimum.—Thos. H. Wittkorn.

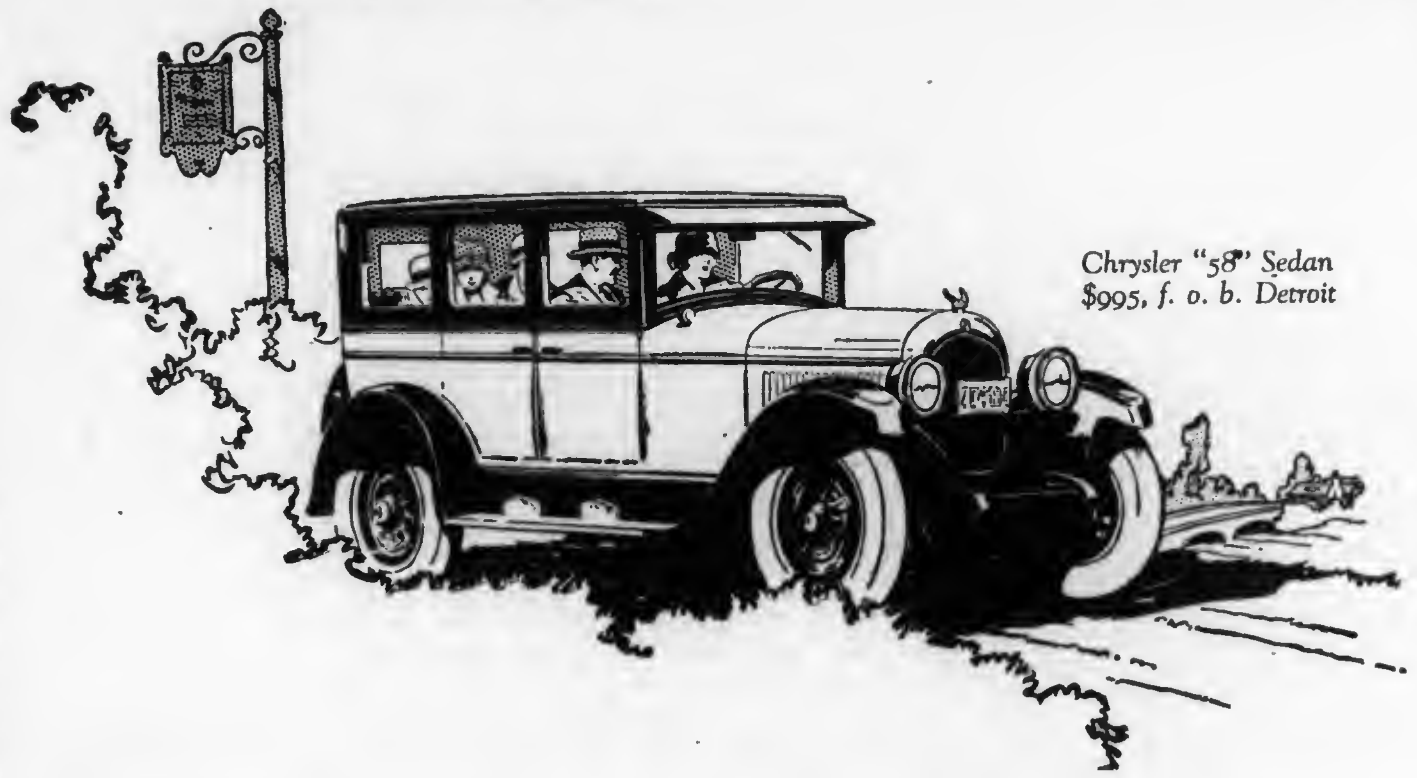
Two colored men were standing on the corner discussing family trees.

"Yes, suh, man," said Ambrose, "I can trace my relations back to the family tree."

"Chase 'em back to a family tree," said Mose.

"Naw, man; trace em, trace 'em—get me?"

"Well, they ain't but two kinds of things dat live in trees. Birds and monkeys. And you sho' ain't got no feathers on you."



PRECISELY THE SAME QUALITY-PERFORMANCE—APPEARANCE—AT ELECTRIFYING NEW LOWER PRICES

Since the Chrysler "58" was announced last June, nearly 10,000 men and women have testified every month by their orders that this wonderful car gives most for the money.

Such striking performance advantages as 58 miles an hour, 5 to 25 miles in 8 seconds and 25 miles to the gallon of gas—combined with many other outstanding superiorities—won for it instant acceptance which caused it to *outsell competition everywhere* in its own particular price group.

Now the electrifying new lower prices make Chrysler "58" more unmistakably than ever the value supreme in its class.

In the accomplishment of these new prices there has been no change in body quality, comfort or style, no change in the high quality design, materials and workmanship which won spontaneous and widespread preference and admiration for Chrysler "58".

Your nearest Chrysler dealer is eager to show you that at these new lower prices Chrysler "58" continues to offer *precisely the same quality—precisely the same performance—precisely the same fine appearance—precisely the same beautiful body and chassis*—which those who know motor car quality agree have placed Chrysler "58" on the topmost value pinnacle.

NEW "58" PRICES

CHRYSLER "58"—*Touring Car, $845; Roadster Special, $890; Club Coupe, $895; Coach, $935; Sedan, $995. Disc wheels optional. Hydraulic four-wheel brakes at slight extra cost.*

. . . .

CHRYSLER "70"—*Phaeton, $1395; Coach, $1445; Roadster, $1625; Sedan, $1695; Royal Coupe, $1795; Brougham, $1865; Royal Sedan, $1995; Crown Sedan, $2095. Disc wheels optional.*

CHRYSLER IMPERIAL "80"—*Phaeton, $2645; Roadster, (wire wheels standard equipment; wood wheels optional) $2885; Coupe, four-passenger, $3195; Sedan, five-passenger, $3395; Sedan, seven-passenger, $3595; Sedan-limousine, $3695.*

All prices f. o. b. Detroit, subject to current Federal excise tax.

Bodies by Fisher on all Chrysler enclosed models. All models equipped with full balloon tires.

There are Chrysler dealers and superior Chrysler service everywhere. All dealers are in position to extend the convenience of time-payments. Ask about Chrysler's attractive plan.

All Chrysler models are protected against theft by the Fedco patented car numbering system, exclusive with Chrysler, which cannot be counterfeited and cannot be altered or removed without conclusive evidence of tampering.

OUR JOB is to serve our readers. Whenever you are puzzled write to us and we will help you if we can.

A great deal of talent is lost to the world for the want of a little courage.—Sydney Smith.

The Italian Debt

WE WONDER just how much justice there is in the proposed terms of the settlement of the debt which Italy owes this country. The amount is about two billion dollars and if the terms which Mussolini demands are acceded to it will look as if the government (or the money lenders) are more concerned over the welfare of the Italian government than they are about some important interests in this country. The people who loaned the money will not do the forgiving of the debt. It will mean that this government assumes it and will collect it from the people. We are strongly opposed to taxing the people of this country to pay back the money which bankers and other individuals loaned to foreign governments.

Let the Organizations Organize

PENNSYLVANIA is genuinely interested in the recently formed alliance between New Jersey farm organizations, the object of which is to give Garden State farmers a united voice in dealing with the state legislature and in handling other matters which affect the agriculture of the state as a whole. Provision has been made for an office in Trenton to be supported jointly by the member associations.

Farm organizations are commonly accused of not knowing what they want, which is another way of saying that some of them want one thing and some another. If the farmers of New Jersey can agree upon their common needs, their joint efforts thru the new organization will make them a power to be reckoned with.

The Keystone State has a similar organization called the State Council of Pennsylvania Agricultural Associations. But the Council is a money-less concern. It is dependent for support upon irregular and uncertain contributions from individuals and from two or three of the stronger member organizations. Sometimes it has money, sometimes it is "broke," and sometimes it is in debt. The officers, in spite of their handicaps, have had some success in presenting the ideas of farmers to Harrisburg officialdom. But with little if any active support from many of the member organizations, and with no income, the Council cannot go far.

Regulations

WE HAVE an article from a farmer who protests the many regulations imposed upon the farmer. He mentions the T. B. testing, the potato quarantine, the certification of poultry farms, seed stock, the inspection of bees, and the efforts made to control fruit insects and diseases. In addition to the annoyance to farmers the writer objects to the number of "white collar jobs" which these activities create.

The writer might have mentioned a great many other restrictions which farmers and others must observe. In fact, there are certain regulations imposed either by law or common usage confronting us at every turn, from the time we get up in the morning until we go to bed at night. Even in sleep the snorer is often aroused and told to turn over because he annoys someone else. Restriction and regulation are what make civilized society possible, and it is because all are not sufficiently intelligent or willing to know and observe the right that others are appointed to carry out the demands of the majority in promoting the common good. We have little patience with the age-old demand for complete personal liberty. The one man who ever had it—Robinson Crusoe—had a harder time than we have. If a man will not control his Canada thistles, if he persists in polluting streams, if he will raise and ship warty potatoes or sell poultry infected with disease, the public has a perfect right to step in and stop him in the interest of the general welfare.

Tax Reduction

BEFORE this is read it is probable that the tax reduction bill will be passed and signed. By it the federal taxpayers will pay into the United States treasury nearly four hundred million dollars less in taxes the coming year than they paid last year. Thus the big taxpayers will have been answered, at least partially. Now we shall see whether the reduction will result, as we were told it would in increased prosperity and lessened costs for all. The reduction is to be commended because the former amounts are not now needed by the government.

But as great as is the jubilation by the big interests because of the lessening of the income tax, there is nothing being done to lessen the average man's home taxes. He will pay as much or more in 1926. The cost of local government has not been deflated, nor have any changes been made in the methods of raising the money. Until there is a more nearly uniform system of taxation in the different states, and an honest effort made to collect an equal tax from every dollar of wealth, taxation will continue to be unjust.

History Repeats

IT WILL be interesting to note whether voters' memories are any longer than their noses when the present members of the Pennsylvania Legislature come up for reelection. Their failure to pass laws to curb election crooks, to make banking safer, and to bring law-defying brewers into subjection indicates a type which surely does not represent the rank and file of the citizenry of the state. Lawmakers who take their order from the ward heeler type of politician should be repudiated by the honest citizens when they come up for reelection. But the history of the past gives little encouragement for believing that their records will defeat them. The average voter seems to have a capacity for forgiving that exceeds even the scriptural recommendation of seventy times seven. So well known is this that the crookedest kind of politician feels secure in his crookedness.

Plant Less and Grow More

THE scarcity and high price of seed potatoes will make this a good year to try out better and more intensive methods on a reduced acreage. It is easily possible to produce the amount of potatoes needed on a very much less acreage than is usually planted. No one can afford to put seed potatoes into the ground at the price they will be this year and harvest only a normal crop,—something like 110 bushels per acre. Wherever it is worth while to grow potatoes commercially it is easily possible to raise this average yield to 220 bushels per acre by choosing the right soil, thoroly preparing it, making heavy applications of high-grade fertilizer, giving thoro cultivation, and spraying thruout the season.

Improved Terminals

THE plans of the Pennsylvania Railroad Company for improved terminal market facilities in Philadelphia will be good news to the fruit and produce shippers to this city. The company will build two immense buildings at the Delaware River, each 650 feet long, where 100 freight cars may be unloaded at one time. Cold storage facilities will be provided where produce may be stored until needed, and provision made for conducting sales by the auction method. The market now located at Chestnut and Thirtieth Streets will be abandoned.

Surely, this is a move in the right direction. The present method of piling unloaded produce in small rooms and on the sidewalks around the produce markets where it must be sold at once and in a more or less haphazard way is highly unsatisfactory and is one of the chief causes of gluts and low prices.

Washington Letter

DISPOSING OF THE SURPLUS.—The forces promoting the Dickinson surplus disposal bill are about ready for action. George N. Peek, of Illinois, is their leader. This bill, however, will not have easy going. Its chances of becoming a law during this session of Congress are exceedingly slim. It lacks the united support of the farm leaders even from the Middle West. Those who are shouting loudest for surplus disposal legislation are not agreed as to all the provisions in the Dickinson bill. The leaders, would-be and otherwise, agricultural and political, are more hopelessly divided now than they were two months ago. The surplus disposal advocates have not only failed to keep out of factional fights, but have succeeded in getting mixed up with party politics.

The executive committee of the National Grange in session in Washington a week or so ago did not give much encouragement to the Dickinson bill or any other scheme which proposes an equalization fee or government price fixing. The Grange committee did not object to a Federal Farm Board, but it failed to agree on other provisions in the Dickinson bill.

ACTION OF GRANGE COMMITTEE.—The National Grange executive committee favored the enactment by Congress of legislation setting aside one day to be known as Agricultural Day which shall not be a legal holiday; increasing appropriations for the eradication of bovine tuberculosis to $6,000,000 for 1927; pending legislation for the prevention of worthless foreign seeds being used to adulterate domestic seed, and opposed the Stanfield grazing bill as detrimental to national forest conservation.

The committee conferred with Secretary of Agriculture Jardine relative to amendments and changes in pending agricultural legislation, and held a conference with Thomas G. Cooper, chief of the Bureau of Agricultural Economics, urging more complete study of the taxation problem as it affects agriculture.

HARD KNOCKS FOR TARIFF COMMISSION.—The United States Tariff Commission is receiving some hard knocks in and out of Congress. It is denounced by committee leaders of both political parties as a useless governmental agency, worth nothing to the government. The "outs" declare that it has shaped its conclusions in favor of protection to suit the present administration, while the "ins" are equally emphatic in saying that the commission sided with the advocates of low tariff during a former administration. It is claimed that with the present method of electing members, its decisions are almost certain to be favorable to the administration whatever side may be in power.

APPROPRIATIONS FOR T. B. ERADICATION.—The agricultural appropriation bill, as reported to the Senate, carries a total of $129,370,468, an increase of $2,366,940 over the House bill. The principal increase is $1,897,000 for eradication of bovine tuberculosis. This makes a total of $6,000,000 for this purpose, which is the amount asked for by the farm and dairy organizations. The sum of $185,000 is allowed for continuing fertilizer investigations and the fixed nitrogen laboratory.—E. E. Reynolds.

Harrisburg Letter

LABOR AND ROADS.—Opening of the road building season in the next month or so, with probably the greatest mileage under contract in state history, and many more miles to be let by June 1, has caused some apprehension here about the farm labor supply for the coming season and steps are being taken by the State Employment Service in the Department of Labor and Industry, acting in conjunction with the Department of Agriculture, to get lists ready. The Employment Service now has more offices than a year ago and is in better position to make contacts. Contractors have been getting busy seeking men and teams and the expansion of building operations and of industrial establishments generally has somewhat complicated the farm problem. Advice is being given to farmers to make their engagements early.

TWO NEW LAWS.—Capitol Hill is putting into motion preliminaries for enforcement of the new alcohol control and gasoline station registration laws, which were among the few products of the special legislative session. The alcohol board plans to work in conjunction with special enforcement officers and the state police in checking up on alcohol shipments and to keep tabs on manufacture. The launching of the new system is being watched with considerable interest. Under the new gasoline act every filling station will have to display a state license for that particular location and every change must be reported. The idea will be to check up on sales for taxation purposes and sale without license will be followed by arrest under the plan now proposed.

DRIVER FARM WORKER.—The State Compensation Board has ruled in a Philadelphia case that a man employed to drive a truck for a market gardener and flower grower, and who also helped at a stall in a market as well as at the farm building, was an agricultural laborer and therefore no compensation claim could be permitted. The driver in the case died from injuries received from a trolley car striking the truck. The board goes into considerable discussion of the case which establishes another precedent on what constitutes farm labor. In another case it is held a man riding racing horses for a man who had a racing stable in connection with a country estate and farm came under the compensation act and was entitled to payment in the case of injury.

WARNING ON REGISTRATION.—State agricultural authorities have renewed the warning given about the first of the year that retailers and others handling cattle feeds and fertilizers must attend to registration. Notice is given that prosecutions will be carried out in event the law is not observed. The number of failures to register was a surprise last year.—Hamilton, Harrisburg.

New Jersey Letter

HOLSTEIN MEN CONFER.—Producers of Holstein milk on the New Jersey side of the Philadelphia milk shed have been up in arms recently over the so-called discrimination against milk in this area that is not high in butterfat content. Recent gatherings, such as that of the Mercer County Holstein Association, have brought out facts indicating that the market premium in the Philadelphia area is based more largely upon fat content than bacteria count and quality. The Holstein men claim that market premiums should be upon quality rather than high fat content alone. The national association is working with the local Holstein men in an effort to correct this situation.

FARMERS' COOPERATIVE ELECTS.—At the annual meeting of the Farmers' Cooperative Association at Rio Grande in Cape May County, the following officers were elected: D. C. Tudor, president; Uriah Cresse, vice president; O. Douglass, treasurer, and the board of directors, E. O. Lehmann, D. C. Tudor, Charles Cresse, Walter Cresse and William Kimble. Last year the association did a business of over $30,000. All transactions are in cash, the cooperating growers taking advantage of all discounts as well as large scale purchases. The membership cost is $5 initiation fee and no annual dues.

POULTRY SHOW NOTES.—At the instigation of the New Jersey State Poultry Association, various poultry interests in New Jersey are about to launch a movement for a large poultry show at Atlantic City next fall. Plans contemplate the use of one of the piers and the handling of an exhibition which will be second to none in the state. Eggs and poultry supplies would comprise an important part of the show. The secretaries of the various local poultry shows in New Jersey will meet shortly at Trenton to arrange dates for next fall's exhibitions so as to avoid conflict.—B.

New York Letter

TOO MUCH IMPORTED CLOVER SEED HERE.—From November 23 to January 9 more than 7,000,000 pounds of foreign-grown clover seed was imported, according to the Federated Seed Service News. Ohio received the biggest amount, 10,424 bags, with New York next, 6810 bags, while Pennsylvania has had 1370 bags. This valueless seed cannot be detected after it goes onto the market. Only careful cooperative buying and proper legislation can protect the farmers from this deplorable form of victimizing, as the Italian seed will not winter. A great deal of this seed goes west to come back, it is said, labeled "Domestic Grown." A well-known Cornell economist advises for these days a very conservative financial outlay excepting in two items, education and clover seed. "Get the best" in both lines, he advises.

OATS DISCARDED.—The Oswego County Farm Bureau is leading in a "substitute for oats" campaign. "Barley produces thirty to fifty per cent more digestible material per acre than oats; oats and barley will produce more than either crop separately; and peas, oats, and barley beats them all"—this is the statement that is stressed. One farmer of the county who grew the trio mixture last year had a yield of forty-five bushels per acre. He says it kept him out of the county house this year, as he fed it to his cows. Another who had piled up a bad feed debt for the past few years this year grew and fed this mixture, paid up the debt, and had a little change left. He used a thirty-two per cent supplementary mixture.—M. G. F.

The Nichols & Shepard Threshers

The famous 4 Threshermen, Hyatt Roller Bearings—Alemite-Zerk Lubrication and Tilting Feeder

ADDED to the improvements that made the Red River Special Line so popular in 1925, are more advantages for 1926.

In 1925, farmers found the same N&S quality as of old, together with greater convenience, lower power requirements, smoother running and freedom from breakdowns, hot boxes and rebabbitting, never known before.

So they bought—and are glad they did.

Roller Bearings remain standard equipment. In addition, Alemite-Zerk Lubrication still further reduces the time and work of "oiling up."

Another new feature, the tilting feeder, gives free access to cylinder and concaves—a time saving convenience you will appreciate.

The construction is practically all steel and the machine will last a lifetime. Big capacity and ability to thresh under difficult conditions make it a profitable machine to own.

The famous 4 Threshermen of the Red River Special are there just as they have been for years past—*saving all the grain.*

There is a size for every tractor, a complete gas or steam rig for every size run. *Write today,* and get full particulars on this improved thresher.

We will gladly send this book free upon receipt of this coupon

Hoffman's Farm Seeds

Clean—Pure—Sound—Hardy kinds that yield better

This New Catalog *FREE*

Write today for this free book. Every farmer who believes in good seed should have this Catalog. It is different from other lists. Offers seeds for field crops only. Kinds adapted to your soil and climate—that will succeed. Gives some cultural ideas for the beginner, and maybe some pointers on standard crops that may help you.

Samples Mailed FREE

Just mention the samples you would like to see, and they'll come along without charge.

Clover Seed— All varieties Sweet Clover, Red Clover, Mammoth, Alsike, etc. Cleanest seed only. Free from foul weeds. Tested and sound. Hardiest strains of known origin. Very fair prices.

Alfalfa Seed—Finest assortment of hardiest Alfalfas. Genuine Grimm, hardy Ontario Variegated, famous "Northwest" brand, and true Kansas seed. If you grow alfalfa, learn more about these strains. It will pay you!

Seed Oats— Six kinds. Extra clean, heavy, sound seed. Including famous "Shadeland Climax" and "White Russian" varieties—both extra good yielders. Catalog gives details—be sure to read them.

Seed Corn— Ten varieties. Kinds for husking—early, medium and full-season. Several special Silage corns. Splendid strain of true "Lancaster County Sure Crop"—the corn of real merit—that is making all other corns "sit up and take notice". Very low cost per acre. Tested—highest germination. Investigate!

Potatoes—Selected and Certified. Grown in Maine and Michigan. The standard varieties—at fair prices.

Barley—Rye—Wheat— All these grains (and others too) in first-quality seed. Cleaned right. Northern grown. Prices are right.

Pasture Grasses—Many varieties. Special formulas made to order. Finest Timothy seed. An extra nice lot of Timothy and Alsike at an attractive price.

Soy Beans— Lowest prices for years. Splendid quality seed. This is the year to get acquainted with this valuable crop. Finest, northern-grown Field Peas to sow early with Oats. Many other kinds of Seeds.

Good Seeds Pay Best

Put your money into good seed. Nothing else pays as well. This ad points the way—answer it at once. Every bag of Hoffman's Seed is sold to please you—and it must do so. A plain guarantee (printed in Catalog) goes along with every purchase you make here. Mail your letter or post card today to

Looking for Facts in the Dust-Spray Controversy

ACCORDING to the old saying, you can prove anything with figures. If you take the figures published by various agricultural experiment stations on experiments comparing spraying with dusting for the control of orchard insects and diseases, the adage holds good. Taking the figures on the results of those experiments you could make out a very strong case for or against either method.

We should not close our eyes to the facts recorded by the college men. Neither should we ignore other facts bearing on this subject, if we are trying to arrive at the real truth of the matter. The men who believe in dusting as a means of controlling orchard pests have thus far had to present their ideas to a skeptical and sometimes antagonistic audience. Being new in the field, the men who used dust had to have the results of their first groping experiments compared with the results of spraying methods which had been evolved after many years of trial and investigation. Naturally, the dusting method suffered in these early comparisons.

Such a result was to be expected, but the unfortunate thing about it is the fact that many orchardists turned their backs on dusting, following those early experiments, and haven't looked around since to see what is happening now that the dusters are profiting by more years of experience, better materials and improved machinery.

The dusting machine covers a large area in a short time.

Example of Progress Made

As an example of the progress that has been made in securing control of apple scab with dusts, a series of experiments conducted over a period of six years by the Pennsylvania State College may be cited. The data on these tests show that, until 1924, dust gave rather unsatisfactory results in the College orchard.

Up to that time the material was applied with an early model machine that, to all appearances, did the work fairly well. But in 1924 the dust was applied with a new model machine of a standard make, with the result that in a very bad scab year, the dust gave slightly better scab control on Stayman Winesaps at State College than the standard spraying methods. Ninety-five per cent of the fruit on the untreated plots was affected with scab, while less than one per cent of the fruit on one of the dusted plots showed any scab whatever. In the same orchard the trees treated with lime sulphur spray had fourteen per cent of scabby fruit. Trees receiving dry lime sulphur spray had 6.9 per cent of scabby fruit.

Scab Control Experiments Bulletin

Bulletin Number 190, which contains complete data about these scab-control experiments, may be obtained by writing to the Mailing Room of the Agricultural Experiment Station, at State College, Pa. Altho the authors of this bulletin state that they feel lime sulphur, used at the proper dilutions and properly applied, still holds its place as the standard fungicide for scab control, they are very optimistic about the use of dusts. The summary of this bulletin contains this significant paragraph:

"The six years' work involves many experiments with various dusts. As pointed out in connection with the tables, sulphur dust, especially 90-10 (90 per cent sulphur, 10 per cent arsenate of lead), 80-10-10 (80 per cent sulphur, 10 per cent arsenate of lead, 10 per cent lime), 85-15 (85 per cent sulphur, 15 per cent arsenate of lead), and dust containing nicotine, has given some very promising results. It is felt that these results have been increasingly promising the past year or two, and that the use of new and more powerful dusters, together with more finely divided dusts, has been largely responsible. The experience of the man who applies the dust and the necessity of making applications at a time when wind interference is at a minimum are also important factors."

The results of the 1924 experiment led the above quoted authors to dust last year the entire seventy-five-acre College orchard. The results for 1925 do not appear to conflict with the 1924 results. The question as to whether better control of scab might have been secured with lime sulphur is, of course, open to debate. But the fact is that the dust gave satisfactory control in 1924 in a bad scab year with a minimum expenditure of time and effort.

It formerly required 679-man hours, 74-team hours and 195 tractor hours to cover the College orchard with the spray machines. It is now thoroly dusted with 232-man hours and 116-team hours.

The Michigan Agricultural Experiment Station at East Lansing has been experimenting with dusts for several years. In its Special Bulletin Number 140, published in January, 1925, it points out that "The principal advantages of dusting over spraying are: (1) greater rapidity of application, (2) less foliage injury and (3) better finish on the fruit."

This bulletin goes on to state that "Some growers use a combination of spraying and dusting on apples and pears, using standard spraying materials for the pre-blossom applications which are usually the most critical for the control of scab, and dust for the after-blossom applications when scab is less difficult to control and when foliage injury and russeting of the fruit are more likely to develop. Dusting might be used to advantage under some conditions as an auxiliary to spraying to supplement limited spraying equipment in large orchards and to enable the grower to cover the orchard quickly under emergency conditions."

This Grower Entirely Satisfied

One of the best known apple growers in Pennsylvania harvested last fall an 18,000-bushel crop on which nothing but dust was used. We asked him if he was satisfied with the dusting method. His answer was an unqualified "Yes."

This orchardist investigated thoroly and concluded that, for him, dusting was the thing. Not all who study the matter will arrive at the same conclusion, but if fruit growers base their judgment on proven facts and up-to-date experiments bearing on their own peculiar conditions,—and not on prejudice toward one method or the other,—they will not go far wrong.—W.

How to Prune Grapes

GRAPE vines which have been adequately pruned during the first two years in the vineyards, may be expected to bear a small crop the third year after planting. Any time during February or early March is suitable for pruning.

All vines should be pruned when planted so that only two strong buds are left on each plant. After one year's growth it is desirable to prune back two buds again. If both buds grow, the weaker shoot should be rubbed off so that the plant will use all its energy in developing one good strong cane, which will become the permanent trunk.

At the end of the second growing season the cane which is to become the permanent trunk of the vine should be pruned back to five and one-half or six feet, or to the top wire of the trellis. All other canes, and side branches, should be removed.

After the third growing season the regular four-arm Kniffen type of vine can usually be formed by training one vigorous cane from the permanent trunk in each direction on each of the two wires. Canes on the top wire can carry about six buds this year, whereas those on the lower wire should be pruned to four to five. All other canes should be removed entirely. Another year may be necessary before weak vines are large enough to carry the four arms. —J. H. Clark, N. J. College of Agriculture.

Mid-Year Graduates

FORTY-SEVEN seniors received diplomas from the Pennsylvania State College at the thirteenth annual mid-year graduation exercises held February ninth.

Among the graduates were the following from the school of agriculture: C. E. Dissinger, Sunbury; R. M. Schultz, Benton; R. J. Salmon, Centerville; B. C. Schaffer, Pittsburgh; C. B. Wachsmuth, Butler; V. E. Heffelfinger, Vandegrift; G. L. Bumgartner, Natrona, and L. A. Robbins, Hecla Park.—A. L. B.

PRESSURE up to 600 lbs. if you want it—in the larger Hardie machines.

Garden and Truck Crops

Cold Frame Construction

Would you please send me instruction on how to make cold frames for tomatoes and cabbage plants.—W. A. H. P., Lawrence County, Pa.

In bulletin 221, issued by the Colorado Agricultural College, you will find that the construction of cold frames is very carefully and fully explained.

In Pennsylvania it is the custom to plant seed for early cabbage from the first to the fifteenth of February and seed of tomato about the fifteenth of March. If you build a cold frame it will be necessary to plant the seed where they will be protected. Perhaps small boxes kept in the house in a sunny window. The small plant could be transplanted into the cold frames about the middle of March.

If you build a hotbed it will have bottom heat and can be used earlier. —W. T. Tapley.

To Grow Good Crops

1. Is lime good for asparagus and rhubarb? If so, how applied?

2. Is muriate of potash and nitrate of soda good for same? If not, what is good to use in putting out a bed?

3. In putting manure under melon hills how would you keep it from drying out so the melons can come up?

4. How can I raise 100-pound pumpkins? My land is sandy.

5. What is the best fertilizer to get early tomatoes and early cabbage?—J. C. S., Fairfax County, Va.

Asparagus is found in that group of vegetable crops which does not grow and produce well under acid conditions. The soil is a complex chemical mass made up of two groups of elements and compounds. One group has basic properties which are sometimes called sweet or alkalin. The other group has acid properties, which are commonly described as sour. Every soil tends to gradually accumulate an excess of acid constituents. As a result of cropping and of weathering and leaching, the basic elements are removed from the soil more rapidly than are the acid elements.

Lime maintains a neutral or an alkalin condition of the soil. Therefore lime is the material most commonly used to keep the soil neutral or slightly alkalin. When applied it should be as thoroly mixed with the soil as possible. It may be broadcast or spread with a grain drill or lime drill, then mixed with the soil by harrowing. From 1000 to 1500 pounds of lime per acre once in five years will generally put a soil in good condition. Different soils may require more or less.

Adapted to Soil Conditions

Vegetables as plants offer quite a range of adaption to acid, neutral or basic soil conditions. Asparagus requires an alkalin soil, rhubarb is more tolerant of an acid condition but will give a small increased yield (under ten per cent after liming).

2. Muriate of potash is used as a source of potash. Nitrate of soda is used as a source of nitrogen. All vegetables require in the soil certain foods (plant foods) in order that they may grow. The three most necessary plant foods are nitrogen, phosphoric acid and potash. These are supplied in a virgin soil but after a term of years of cultivation become exhausted and, therefore, must be supplied either thru adding animal manure, commercial fertilizer or growing a cover crop to plow under.

In preparing the soil before setting out a bed of either asparagus or rhubarb, I would apply about ten tons of stable manure per acre before plowing and fertilize with a commercial fertilizer, about 1000 pounds of a fertilizer analyzing about five per cent nitrogen, eight per cent phosphoric acid, and four per cent potash. A small patch for the home or farm garden may be prepared by spading in liberal quantities of barnyard manure and mulching the rows heavily each fall with the same.

To Make the Soil Richer

3. Manure is placed under the hill of muskmelons, pumpkins and squash in order to make the soil in the hill richer, or to furnish a greater quantity of plant food. The moisture supply in the surface soil as it dries out or evaporates, is replaced by moisture from below. The moisture moves up by capillary action from particle to particle. Manure, especially that containing a large percentage of straw, breaks the contact of the soil particles above the manure with the soil particles below. In other words, the soil surface just below the manure becomes the real top and moisture is prevented coming up into the seed bed.

If, after the seed germinates in the seed bed above the manure, the roots go down thru the manure into the soil below the plants will get plenty of moisture. The remedy to prevent plants drying out is to (1) use well rotted manure, and (2) to work or mix the manure into the soil below so that the roots can grow into the soil. Manure covered with two or three inches of good soil is not the best method, stir up the soil under the manure or work the manure into it.

Water an Essential for Growth

4. One-hundred-pound pumpkins can be grown if sufficient plant food and moisture are available to the plant. Work manure in under the hill. Add a handful of commercial fertilizer and every week during the season throw on a teaspoonful of nitrate of soda. Remember this, however, a large vine growth requires a large water supply so don't fail to throw on a pailful of water every day.

5. A good fertilizer for early cabbage and early tomatoes is an application of 2000 pounds of a mixture analyzing 3 per cent nitrogen, 10 per cent phosphoric acid, 2 per cent potash. Fifteen hundred pounds of a 4-12-3 mixture would be about equivalent. Tomatoes respond to manure better than cabbage, therefore, apply the manure to the tomato field. Ten tons of manure to the acre is sufficient. An extra application of acid phosphate (200 pounds per acre) is sometimes an advantage in the case of tomatoes. For cabbage a side application of about 75 pounds of nitrate of soda per acre applied one month after setting will give results.—W. T. Tapley.

The City Market at Newark

A FEW weeks ago I visited the City Market at Newark, New Jersey. The large market house was erected three years ago by the city to take the place of a long row of typical "market section" buildings. This market is an eye-opener, it may not be an entire success but there seemed to be plenty of business going on. Huge, clean, light, roomy; it certainly looks as tho it would fill the bill. But there are many classes that must be satisfied.

The merchant must rent his stand so that he can make a profit out of the difference between the price at which he buys and the price at which he sells. The city must get a total return from the building large enough to pay for maintenance, interest on the investment and to retire some of the cost each year. The consumer or buyer wants to be able to buy what he wants when he wants it and at a price which he thinks is reasonable.

In the Foodstuffs Line

In the line of foodstuffs, I believe these three conditions can be met at any time at the market house. True, the price might have been a trifle high but the quality was high grade and the service excellent.

All classes of foods were displayed: fruits, vegetables, bakery goods, meats, sea foods, groceries, as well as flower stores and a thriving "five-and-ten" across one end. I do not intend to bore you with the description of the building, the material used for floors, the arrangement of the individual stores, etc. The thing that impressed me was the really large number of kinds of fresh vegetables offered to the city dweller. We can imagine that the cliff dweller had small choice in his supply of vegetables, especially in winter.

Supply of Fresh Vegetables

In the month of January these fresh, delicious-looking vegetables were found in the Newark market house: artichokes, green beans, wax beans, lima beans, shell beans, beets, beet greens, Brussels sprouts, carrots, cabbage red, Savoy cabbage, celery, cauliflower, corn salad, chicory, celeriac, casawba melons, cucumbers, endive, kale, lettuce, leeks, mushrooms, okra, onions, parsnips, peas, potatoes, parsley, peppers, radishes, romaine, rutabagas, salsify, spinach, squash, sweet potatoes, tomatoes, turnips, turnip-rooted parsley, watercress and yams. If I have counted correctly there were forty-two kinds. All these available to the city man, provided he had the price. This large number is not necessary for the individual family, it does, however, allow a choice to be made and should give the cook an excellent opportunity to serve at every meal some one or two of the health-giving vegetables.

Summer is really in sight, the warmth of the sun is already felt and the seed catalogs are on the desk. Let us plan to increase the number of kinds of vegetables to be found in our gardens during the coming season.—W. T. Tapley.

The New Organization

THE new Pennsylvania Vegetable Growers' Association is rapidly developing into a full-grown organization, according to W. B. Nissley, of State College, secretary of the association. The new association was formed at the recent annual meeting of the State Horticultural Association in Harrisburg. The vegetable growers were formerly members of a division in that body.

A drive for new members is about to be opened. The society plans to serve as an educational medium to disseminate information leading to better understanding of vegetable growing and its several problems; to initiate, guide, and direct the efforts of Pennsylvania vegetable growers along the lines of economic production, research and investigation, grading and standardization of products, advertising, and such other functions as may aid in the development of the industry in the state.

POULTRY

R. G. KIRBY
Staff Contributor and Adviser
Kirby Poultry Farm

Starting Young Turkeys

A GOOD starting feed for young turkeys can be made by soaking stale bread in milk. After it is soaked, squeeze it out nearly dry and feed just the amount the young turkeys will clean up in a few minutes and still appear a little hungry. Chopped boiled egg mixed with bread crumbs gives good results. Thick sour milk and corn bread crumbs are sometimes used. Just a little seasoning with salt and pepper seems to make the mixture more appetizing to the poults.

Poults are seed eaters and insect eaters and sloppy mashes often give them digestive disorders. Sour milk can be given as a drink and it seems to retard bowel trouble. When poults are about three weeks old, fine chick scratch feed and rolled oats can be worked into the ration. They can be gradually given larger grains as their size permits.

Keep Them Away from Chickens

The smallest losses from blackhead seem to occur among young turkeys that have a range fenced away from the chickens. Blackhead seems to be the most prevalent when the poults feed in the barnyard and around the buildings with the hens and growing chicks. Chickens seem much more resistant to blackhead than young turkeys.

It pays to raise the poults in orchards and around clover, alfalfa and grain fields where the soil is comparatively clean and the turkeys do not eat feed which has become contaminated with the droppings of the chickens.—R. G. Kirby.

Needs of Breeding Stock

EARLY hatching means that many of the eggs placed in the incubators must come from hens which have not had a chance to range. This close confinement from November until April is apt to lower the hatchability of the eggs and everything possible should be done to keep the breeding stock in good condition.

Scientists at the University of Wisconsin found that the vitamin content of eggs may vary greatly. Eggs produced by hens which have had plenty of sunlight or cod liver oil may have nine times the vitamin content of the eggs laid by hens without sunshine or cod liver oil. The practical value of the discovery for the poultryman can be utilized in this way.

Give the breeding stock as much sunshine as possible. If the days are dark and cloudy and your poultry house is deficient in light, try feeding cod liver oil until the hens can pay for a better house or the winter days are more liberal with sunshine.

The Rate at Which to Feed

Cod liver oil is usually given at the rate of one pound of oil to one hundred pounds of mash. Some poultrymen have successfully tried feeding cod liver oil with semi-solid buttermilk. They use one part of the oil to sixteen parts of the semi-solid buttermilk by weight. Cottage cheese can be fed in this manner mixed with cod liver oil. Four pounds per hundred hens each day is considered enough of the mixture to use.

I have observed that our breeding stock which receives milk and ten per cent meat scrap in the mash seems to produce more hatchable eggs than the birds which receive twenty per cent meat scrap and no milk. It is evident that the use of milk products in a poultry ration may also increase the vitamin content of eggs and make them more hatchable. Green feed is also of value in improving the hatchability of eggs. That may be one reason why hens on free range in the spring produce eggs more hatchable than the eggs produced in January and February on a ration deficient in green feed.

Hens that are very fat may produce eggs low in hatchability. The remedy is to cull out hens that have the tendency to become baggy with fat even on a balanced ration. Such birds are apt to be exclusively spring layers. It is best their eggs do not hatch well, the fewer of that type hatched the better.

Make the breeding stock exercise for their grain in litter that is rather deep and as clean as possible. Occasionally add a little clean straw to the top litter to help keep the hens busy. Turn them outside on good days so they will absorb as much of the direct rays of the sun as possible.—R. G. Kirby.

Three Prize Winning Birds

This purebred Bronze Turkey Tom, weighing thirty pounds when eight months old, won second prize in National Contest, Chicago, during December, 1925. The two hens in crate, his sisters, won first prize. The birds are owned by Chas. W. Wampler, Rockingham County, Va.

Reduce the Risks

A FEW years ago a farmer in our community became interested in poultry and installed a brooder stove in a small shed near the barn. The brooder house caught fire and it spread to the barn. The barn burned fiercely and the fire spread to the house. All the buildings on the place were gone in a few hours.

It pays to locate brooder stoves in colony houses far enough from large buildings to reduce the fire risk. Brooder stoves are carefully built to reduce the risk but where there is fire there is always some danger. A colony house should be easily moved to enable the chicks to have clean ground for a range. So why is it necessary to back the colony house up near the house or the barn? The chicks will do better in an orchard or clover field several hundred feet from the barn.

Care of Ashes

Be careful in emptying the ashes from coal burning brooders. If any hot ashes are accidentally spilled, clean them up and pour a little water from the poultry fountain over the spot. Do not permit the straw litter to become banked up around the brooder thru the scratching of the chicks.

Oil brooders need careful adjustment so they will not go out nor overheat. A layer of sand under the stove and around the deflector will help reduce the fire risk. Litter can be placed over the sand so the feet of the chicks will not be dried out and blistered. Dry sand under a warm brooder stove becomes very hot from the heat of the stove but it helps prevent a fire starting on the floor.

The small handy fire extinguishers may be of great value to a poultryman at the most unexpected time. A few pails of sand suspended from the ceiling of one of the colony houses might be handy in putting out a fire on the floor of a colony house.—R. G. Kirby.

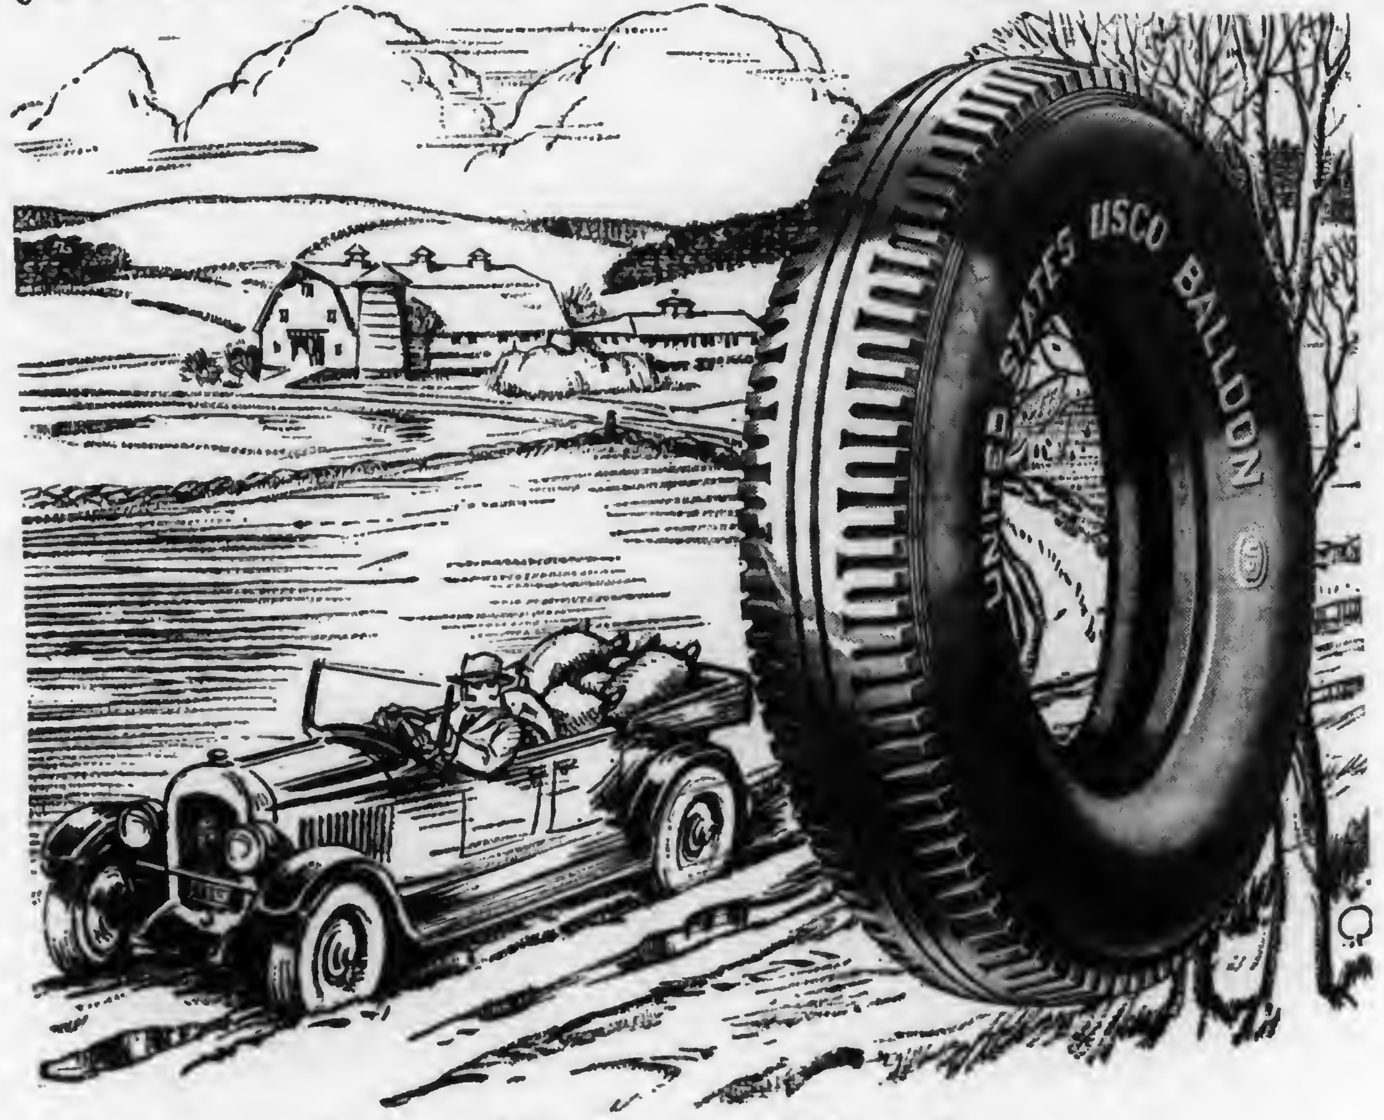
Grain Finely Ground

LITTLE chicks have a delicate digestive system and cannot handle large amounts of fiber without danger of clogging the digestive system. That is one reason for the success in starting baby chicks with the commercial mashes containing dried buttermilk and fine ground grain. The grains are ground to powder and are easily digested by the chicks.

Last year I visited a poultryman using a home made starting mash made with the same formula as his laying mash. It consisted of 100 pounds each of ground corn, ground oats, bran, middlings and meat scrap. We examined several chicks that were off-feed and several that had died during the preceding night. The crops were packed full. On being opened they proved to be largely filled with a mass of oat hulls. This tough fiber had been too much for the digestive system of a young chick. Altho less than ten per cent of the chicks were in that condition, it was apparently the cause of enough loss to prevent the further use of the ground oats in the chick mash.

Oats in Chick Mash

If oats are used in the chick mash they should be in the form of oatmeal and that eliminates the tough hulls from the mixture. Heavy oats if ground finely can undoubtedly be used in chick rations but the mills in some communities do not grind the oats fine enough. They tear up the oats but leave the hulls visible and far from the fine powder that is necessary in chick feeding.—R. G. Kirby.



UNITED STATES TIRES ARE GOOD TIRES

Independent of Road or Weather if you use USCO Balloons

IT is a comfort to feel that the tires on your car will carry you where you want to go no matter what the weather is or how bad the roads are.

The great success of the USCO Balloon lies in its ability to do that—and do it without harm to the tires.

When you look at an USCO Balloon you will at once notice how broad and *flat* its tread is. With so much tread area in contact with the road, there is always adequate purchase for a hard pull and for sure braking action.

You get the same advantage that the wide, flat wagon wheel gave over the earlier narrow rimmed wheels. In addition, the USCO Balloon has a high-shouldered tread that takes a firm hold on the road.

The cord construction has unusual flexibility. You get *real* balloon cushioning—comfort for the passengers, protection for the car.

The USCO Balloon is made strong and sturdy. It will deliver length of service far beyond what its moderate price indicates.

It carries the trade mark and full warranty of the largest rubber manufacturers in the world.

FEED MORE

Linseed MEAL

You may have been feeding a certain amount of Linseed Meal for its laxative effect—its beneficial action on the bowels. But are you aware that liberal quantities, fed for the PROTEIN content, show splendid results? The following are typical endorsements of the general qualities of Linseed Meal:

Increased Milk Flow 15% to 25%.
J. H. Berger, Mgr. Jersey Crest Farms, Oconto Falls, Wis., writes: "Approximately 10% to 15% of our ration consists of Linseed Meal. I have found that in many instances, it has increased our milk flow 15% to 25%, especially in cases where the hay was poor."

Shortens Beef Finishing Period 30 to 40 Days.
R. J. Barrett, Dallas Center, Iowa, says: "Linseed Meal shortens the finishing period from 30 to 40 days over straight corn and clover hay, and gives a much better appearance and a smoother coat of hair."

Profitable for Anyone Who Feeds Cattle or Hogs.
Mr. C. W. Falcon, Secretary Marion Inter-State Fair Association, Marion, Iowa, states: "I feed Linseed Meal to pigs from the time they commence to eat till they go on the market, right with the other feeds, ground, in self feeders. They get all they want to eat. I would say that Linseed Meal is profitable for anyone who feeds cattle or hogs."

——AND LIKEWISE IT'S PROFITABLE FOR SHEEP AND POULTRY, AND EXCELLENT FOR HORSES, AS WE CAN READILY PROVE.

Balance Your Rations for Greater Profit

We can help you—easily but accurately—it has all been figured out in the two books listed in the Coupon below. These books are chock full of feeding rations which include all manner of feeds in various proportions, extensively used by farmers, breeders, feeders and experiment stations. Get these books, and in addition write to our Secretary, who has had extensive farm and experiment station experience, if you have any unusual feeding problems to solve. No obligation.

DAIRY

A. A. BORLAND,
Staff Contributor and Adviser
Head of the Department of Dairy Husbandry
Pennsylvania State College

Heifer Won't Drink Milk

I have a heifer calf that I would like some advice about feeding. She was about four weeks old when I started to raise her, and have never been able to get her to drink milk yet. She is now about ten weeks old. She will eat a little bran and alfalfa hay, and will go to the creek and drink water but does not seem to thrive. She is very poor and bowels very loose. She seems to grit her teeth a good bit. She is a purebred Jersey.—C. H. M., Chester Co., Pa.

Your Jersey calf will do much better if you can teach it to drink skimmilk. I would suggest that you keep it in the stable for a day until it gets rather thirsty, then moisten the finger with warm skimmilk, place the finger in its mouth, so that it gets a taste of the skimmilk and begins to suck your finger. Then gradually work the hand into the pail of skimmilk, so that the calf will thus get a taste of the skimmilk. Then gradually withdraw the fingers so that the calf will keep on drinking without the aid of the finger.

You may have to repeat this process several times before you get the calf to drink the milk alone. Be sure that the pails in which the skimmilk is handled are sweet and clean, and that the temperature of the skimmilk is about ninety degrees.—A. A. Borland.

Formula Asked For

Please give me a formula of the following ingredients in pounds and how to feed it, or a ration of ground corn, ground oats, wheat bran, corn gluten feed, alfalfa meal, roughage, timothy hay, mixed hay and corn stover. I conduct a dairy of mixed cows, Holsteins and Guernseys. I have no silage.—W. F. E., Schuylkill County, Pa.

I am sorry you do not have clover or alfalfa hay to feed your dairy cows. Leguminous roughage of this sort is a great aid in milk production and in cutting down the amount of high protein concentrates that otherwise must be purchased. Corn silage would also be much more conducive to milk flow than corn stover. With timothy hay, mixed hay, and corn stover for roughage it would be difficult to make a well balanced ration out of the feeds you mention.

For your conditions I would suggest that you grind ear corn and oats together so as to make corn and oats chop, using equal parts by weight of corn and oats. Then mix together:

100 pounds of corn and oats chop
100 pounds gluten feed
100 pounds linseed meal
100 pounds cottonseed meal

Feed this grain mixture to your Holstein cows at the rate of one pound of grain for every four to four and one-half pounds of milk they produce, and to Guernsey cows at the rate of one pound of grain for every three to three and one-half pounds of milk they produce.—A. A. Borland.

So-Called Milk Veins

THE large veins leading from the cow's udder forward, and commonly known as milk veins, carry blood and not milk. It was formerly supposed that these veins carried milk inasmuch as they seemed to originate at the base of the udder, but such is not the case.

When the blood leaves the heart it passes back thru the body of the cow in large arteries which finally reach the udder, where they are broken up into very small capillaries. The blood circulates thru the udder in these capillaries and is then collected in a vein which circulates around the base of the udder from where the blood passes forward thru the veins commonly known as milk veins and enters the chest thru openings known as milk wells.

There are two routes by which blood returns from the udder of the cow to the heart. The other route is thru veins which pass upward from udder and forward nearly parallel to the arteries thru which the blood goes from the heart to the udder.—A. A. Borland.

Strawberries and Cream

TWO circulars recently published by the Pennsylvania State College should prove of interest to Keystone farmers. One of these, "Strawberry Culture in Pennsylvania," is written by Dr. S. W. Fletcher, head of the Department of Horticulture and Horticultural Editor of Pennsylvania Farmer. Because of the large number of excellent markets which are found in the state and the favorable advantages of soil and climate, the outlook for commercial strawberry culture is bright, according to Doctor Fletcher. He believes that Pennsylvania should be one of the greatest strawberry growing states in the Union. With 170 cities having a population of 5,000 or more the Keystone State offers marketing opportunities which are not equaled by any other state in the Union.

Importance of Cleanliness Stressed

L. W. Morley, formerly in dairy extension work at State College, but now with the American Jersey Cattle Club, is the author of "Building the Farm Dairy House." Every farm should have a suitable place in which to handle and care for milk, according to Mr. Morley, as milk ordinances and sanitary regulations of boards of health in many communities require that milk houses or spring houses be a part of the regular dairy equipment. The circular takes up in detail the economical construction of milk houses, and gives a list of the material which is required for the work. Copies of these circulars may be secured by addressing, the Agricultural Publications Office, School of Agriculture, State College, Pennsylvania.—B.

Oppose Milk Invasion

ARISING out of the wrath of farmers whose milk market is menaced by the threatened importation of western milk into New York City thru heavily capitalized corporations, delegates representing the dairymen of eleven dairy counties met at Watertown, N. Y., recently, and formed the nucleus of a new producers' organization. This will embrace both the pool and non-pool interests, and will include the membership of the Dairymen's League Cooperative Association, Inc., the Sheffield Farms Producers' Association, the Non-pooling Dairymen's Cooperative Association, and the independent producers. For weeks they have been discussing the various unfavorable factors, including the freight rates which they claim are partial to the west, the tariff which gives inadequate protection, and the imminent danger of a flood of western milk in the very near future, as seen in the preparations of "Big Money" to bring in such quantities of cheap western milk as would break down the markets to an extent that would take away all chance of a profit for eastern producers.

In groping for a way to combat this movement the "preferential clause" in the Dairymen's League contract with all its dealers has been recognized as the only protection against this competion. The importance of having all producers unite in some way and adopt a similar principle in their contracts is very evident. The old established distributing agencies in New York City can never get along without eastern milk, which is of far better quality, due to better inspection, more rigid barn requirements, and nearness to point of consumption than this competitive milk can ever hope to be. If eastern producers unite for mutual protection they hope to hold their own.

Provision Made for Old Members

A resolution adopted by the conference provides that when the new organization is ready to function the old producers' associations will be provided an opportunity to adapt themselves to the requirements set forth, and if they do so to build the united association so far as possible upon foundations already established. The "Johnson Plan" provides the first vehicle brought forth since the old Dairymen's League was formed in 1916 for the getting together of all producers on a common ground for mutual good in marketing and protective matters.

The best informed men in the dairy industry in New York State for some weeks have been genuinely alarmed over the future of their business as news of the merger of Sheffield Farms with the National Dairy Products Co. has been published, and of the purchases of the United Dairy Products Co. in northern New York. These plans involve an enormous capital. News of the actual building of a huge receiving and distributing plant on the Erie Railroad not far from New York City, to cost something like two and a half million dollars, has been published, as well as the intended use of a large number of tank cars for shipping milk, and the placing of western and middle west shipping stations under New York Board of Health regulations.—M. G. Feint.

Recent Farm Bulletins

THE three new bulletins listed below have recently been issued by the Pennsylvania Department of Agriculture. They may be secured without cost by writing to the Department at Harrisburg.

"Greenhouse Fumigation," Bulletin No. 413, gives detailed directions for the calcium cyanide method of fumigation to control greenhouse insect pests. This is a cheap and effective method which has just recently been developed.

"European Corn Borer Control and Quarantine Regulations," Bulletin No. 414, gives the latest control measures for this serious pest of corn and the quarantine regulations which will be enforced during 1926.

"The Vegetable Industry of Pennsylvania," Bulletin 408, is a 142-page, illustrated publication, giving the first comprehensive review that has ever been prepared of the vegetable growing industry of the state. Detailed cultural methods are given for all the important vegetable crops, as well as general discussions of suitable soils, sections of the state best adapted to vegetable growing, and efficient marketing methods.

Cut Your Feed Costs

WALTER S. KERR, Mgr., THE OAKS FARM, Cohasset, Mass., is Right When He Says:

"From our past experience we know that Sugared Schumacher Feed makes an ideal basis for a dairy ration. Considering present prices it is the most profitable feed in the market. We have compared prices, and are building our young herd, our milking herd, and our net profits by feeding Sugared Schumacher Feed."

Increase Your Dairy Profits

The opportunity continues for every dairyman to cut his feed costs, to increase his milk yields and greatly enlarge his profits. Sugared Schumacher Feed is unusually low priced; cottonseed meal, gluten feed, Boss Dairy Ration and other high protein concentrates are likewise very low. Combine Sugared Schumacher Feed with any of these high protein feeds and secure ideal dairy rations at lowest costs.

Sugared Schumacher Feed

is highly nutritious—its use produces largest milk yields. It is palatable—cows like it. It is rich in the necessary minerals—cows yield more, maintain better health, breed more regularly, and have less disease when fed on it. It grows young stock of all kinds rapidly and economically. It fits the needs of every farm, and insures better results with every class of stock.

THE TIME to make most money from your dairy herd is NOW.
THE FEED to make most money from your dairy herd is Sugared Schumacher Feed.
THE PLACE to get Sugared Schumacher Feed is from your feed merchant, who always has a supply on hand to serve you.

Six Reasons for Unadilla Leadership

It doesn't *just happen* that more Unadilla silos are sold each year than any others. Here are six of the reasons:

A Unadilla cures and *keeps* silage better.

The air-tight *fitted* staves defy frost and save all the valuable silage juices.

It is strong, durable, well-built of *selected* lumber.

The famous Unadilla ladder makes for the greatest silo *safety* and *easy use*.

Every hoop can be taken up 12 inches *at the door front*.

Continuous opening at feed level. You just *push* out the silage.

Order early while the factory is not rushed and effect a real saving of money. Liberal discount for cash.

Write for our silo catalog, containing information on our strongly built storage tanks, water tubs and vats.

UNADILLA SILO CO.
Box P Unadilla, N.Y.

UNADILLA SILOS

ECONOMY SILOS

Made absolutely permanent by our patented Storm-proof Anchor System. Built of the very best materials. Will last a lifetime. Write for catalog and prices.

ECONOMY SILO & MFG. CO.
Dept. 607-E Frederick, Md.

This much cream was separated from the DeLaval skimmilk—by another machine

1/7 lbs. of Cream Testing 4.4% = .075 lbs. of Butter Fat

This much cream was separated by the DeLaval from an equal amount of the other Machine's skim milk

5/7 lbs. of Cream Testing 33% = 1.88 lbs. of Butter Fat

A Real and Easy Test of Cream Separator Efficiency—*Try it!*

PUT a De Laval side-by-side with any other separator of approximate capacity. Mix 20 gallons of milk thoroughly and let it stay at normal room temperature of 70°. Run half through each machine. Wash the bowl and tinware of each in its own skim-milk. Then run the De Laval skim-milk through the other machine and vice versa. Weigh and test for butter-fat the cream each machine gets from the other's skim-milk.

When you do this you will know beyond question of doubt that the De Laval skims cleaner, is easier to turn and is more profitable to own.

Above are the results of such a test between a De Laval and another new separator. Note that the other machine left *25 times more* butter-fat in the skim-milk than the De Laval did.

The new De Laval is the best separator made in 48 years of De Laval manufacture and leadership. It has the wonderful "floating bowl"—the greatest separator improvement in 25 years. It is *guaranteed* to skim cleaner. It also runs easier and lasts longer.

A Great Year For Feeders

Better Animals
Better Rations
Better Profits

Corn Gluten Feed has again proved its value as the most economical protein feed when grain is cheap, just as it always has when grain is high in price. Whether you are feeding to make beef or milk and whatever your grain mixture may be Corn Gluten Feed makes it a more profitable ration.

Many of the highest producing and best conditioned dairy cows this winter are those that came through last spring and summer on a ration balanced with Corn Gluten Feed. Successful dairymen feed it every day in the year.

It should not cost you anything to test Corn Gluten Feed. You feed less on pasture than in the dry lot. Your cows will give more milk, stay fresh longer and go through the summer in better condition. The Corn Gluten Feed you buy will more than pay for itself.

Enter This Great Prize Contest—Now

If you are milking six or more cows or feeding forty or more beef cattle you are urged to enter this great contest. It is a contest between feeders. It is better than feeding for your state fair.

No Entry Fee—No Stall Rent

14 Prizes for Cow Testing Associations	$ 3,000.00
14 Prizes for Individual Dairy Herds	2,100.00
7 Prizes for Championship Cows	1,000.00
14 Prizes for Beef Cattle Feeders	2,500.00
12 Prizes for supervisors or verifiers	2,650.00
24 Prizes for herd managers	1,250.00
37 Prizes for co-operating feed dealers	2,500.00
122 Prizes, totaling	$15,000.00

No state fair or livestock show has ever offered as many or as large prizes for any one definite thing. We have chosen the one thing that interests the feeder most of all and that is *Profitable Production.*

A great number of feeders who are balancing their rations with Corn Gluten Feed will have better conditioned animals and they will make more money. Those who make the best records will win these prizes.

Don't Put It Off—Enter Now

This contest starts April 1 and ends September 30, 1926. The prizes will be awarded and paid December 1. In case of a tie each contestant tying will receive the full amount of the prize.

Don't wait until the last minute to enter. No applications will be received after April 1. Fill out and mail the coupon NOW—so we can enter you in the proper classification.

The simple rules of this contest are given in Bulletin No. 4 which we send together with a valuable book on feeding—free of charge. Please mail the coupon at once.

Haven't Milk for Lambs

Kindly tell me what is the cause of my ewes not having any milk for their lambs, and the cause of their bags being caked so? I am feeding clover hay and corn ensilage and now am feeding twenty-four quarts of oats per day. I feed five bushels ensilage per day. I lost four out of five lambs.—A. R. C., Crawford County, Pa.

The feed which these ewes are getting should supply a liberal flow of milk. The clover hay and silage as roughage and oats and grain make a good sheep feed. You do not state, however, the number of ewes in the flock. I am wondering if the ewes have been getting exercise enough to produce strong vigorous lambs. Occasionally when a considerable amount of silage is fed during the gestation period the lambs produced are large, lacking in vitality and strength. They are then unable to get up to nurse and naturally become weaker and die.

I am inclined to believe that the ewes have a liberal supply of milk and the lambs have not been getting it and the result is a caked udder. It will be a good plan to help the lambs get on their feet and start them to nurse. This is especially true if the lambs seem weak and unable to get up.

It will be necessary to treat the udders to relieve the caked condition. They should be bathed with warm water and wiped dry. Following the bathing the udder should be carefully rubbed with melted lard or raw linseed oil. This should be applied as warm as the ewes can stand it.—W. H. Tomhave.

Not Balanced Ration

I have two sows and pigs and have been feeding some middlings and all the corn they would eat. Pigs are not doing well. Seem to be scoured some and weak in rear quarters. Have lost two. Would like to know what is a balanced ration for sow and pigs. Have not been able to leave them out of pen on account of severe cold and snow.—L. M., Cumberland County, Pa.

These pigs are not getting a well balanced ration. The corn and wheat middling alone do not supply the necessary protein for proper development. I would suggest the addition of some tankage or fish meal to the corn and middlings. Buttermilk or skimmilk may be used in place of the tankage or fish meal if available. A grain combination of four parts corn, three parts wheat middlings and one part of the tankage or fish meal is a splendid combination and I feel certain that such a change will show an improvement in the condition of the pigs in a short time.

Must Have Exercise

If the skimmilk or buttermilk is used, feed about three pounds of the milk to one pound of the corn and middlings in the same proportion as suggested for the other combination. The pigs should also be allowed to get out for exercise if at all possible. It might also be a good plan to treat the pigs for worms. Secure some standard worm capsules from your local veterinarian and use these for the small pigs according to directions.

The ration for the brood sows can also be improved by the addition of some of the tankage or fish meal. The wheat middlings will not be necessary for the sows altho there is no objection to using a small amount. A ration of eight parts

corn, two parts middlings and one part tankage or fish meal is a desirable combination.

The brood sows and pigs might also have access to some clover or alfalfa hay. If this is put in a rack in the yard the pigs will consume a considerable amount of it and soon show the results from this additional protein feed which also provides some bulk.

A mineral mixture made up of twenty per cent salt, forty per cent steam bone meal and forty per cent ground limestone will aid in the development of the pigs. This should be put in a box where the pigs can have free access to it.—W. H. Tomhave.

Combination for Shoats

I am a farmer and have a bunch of shoats weighing about seventy-five to eighty pounds and wish to feed them on a home made self-feeder. Would like to know a recipe that I can get to show me how many pounds of each kind of feed to feed them. At present I am feeding middlings, ground corn and some bran mixed in with a little linseed meal, too. Please give me another to fill so that I can get each by the pound and mix on my barn floor. My hogs are running from my barn yard to the hog pen.—W. G. N., Frederick County, Md.

Several different combinations of grain may be fed in a self-feeder. In most self-feeders, three or four separate compartments are provided so that the pigs can balance their own ration. In this type of feeder, shelled corn, wheat middlings and tankage or any other feed used would be put in a separate compartment and not mixed. Since you have a self-feeder with only one compartment it is desirable to mix the feed for your pigs.

Protein Feed Preferable

The combination of corn, bran and linseed oil meal is not a very desirable combination for young growing pigs. The bran is too bulky and the linseed oil meal is not the most desirable source of protein. A protein feed from an animal origin such as tankage or fish meal is preferred.

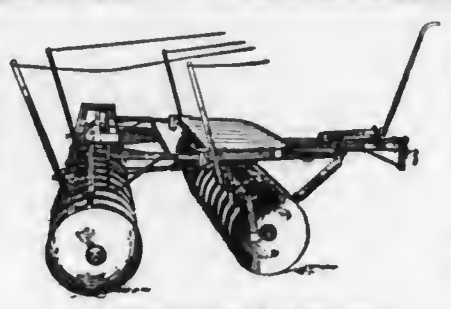
I would suggest the following combination to be used up to the time the shoats weigh about 125 pounds: Corn meal, 40 pounds; wheat middlings, 30 pounds, and tankage or fish meal 10 pounds. This is a well balanced combination and will give better results than the one now used. It may cost a little more money but the increased gains made by the pigs will more than pay for the additional cost of the feed.

When the pigs weigh about 125 pounds gradually displace the middlings with corn. Reduce the amount of middlings so that when the pigs weigh 150 pounds the middlings have all been eliminated and corn is being fed at the rate of 10 parts to one part of tankage or fish meal by weight. Continue to feed this combination up to the time the pigs are sent to market.—W. H. Tomhave.

A Mineral Mixture

Can you suggest a good mineral mixture that might be fed to brood sows that are receiving a ration of corn, some oats and a small amount of tankage?—H. A. C., Bucks County, Pa.

A very good home made mineral mixture is composed of 40 lbs. of crushed limestone or air slacked lime, 40 lbs. of steam bone meal and 20 lbs. of common stock salt. To this mixture of 100 pounds might be added about 0.2 of a pound of potassium iodide. This mineral mixture should be placed where the sows can have access to it at all times. This combination is very satisfactory and quite inexpensive.—W. H. Tomhave.



When Our Ancestors Harrowed with a Pile of Brush—

Very Little Profit Was Taken From the Soil

McCORMICK-DEERING
Tractor Disk Harrow

Just take a look around your neighborhood and notice carefully the progress that has been made possible largely through the help of good farm equipment. Conditions are not ideal, of course, but everybody is making a living and enjoying life to an extent undreamed of not so many years ago.

Yes, things are better, and the McCormick-Deering dealer sells the tools that will carry progress still further. For instance, there is the Dunham Culti-Packer and the McCormick-Deering line of disk harrows [both horse-drawn and tractor types], spring-tooth harrows, field cultivators, rotary hoes, and peg-tooth harrows. Each one of these tools meets a special tillage need. Each one is of old-reliable McCormick-Deering quality.

If you are anxious to increase your farm earning power make it a point to see these tools. You'll be surprised at the improvements made since you purchased your old equipment.

To Fill All Your Tillage Tool Needs See the McCormick-Deering Dealer. It Pays!

THE WOOSTER FEED MFG. CO.,
BOX 65 WOOSTER, OHIO

At Calving Cows need help

From A. J. Olson, Barnum, Wisconsin Jan. 9, 1925

"I have been feeding Kow-Kare to put my cows in good condition for calving. I find Kow-Kare a wonderful remedy for this. It also increases the milk flow. It is the only remedy I look for, for cow ailments and I always aim to feed it about two weeks before freshening."

No wonder so many cows have serious trouble at calf birth. Housed in during the long winter months, little opportunity to exercise, dry, hard-to-digest winter foods—how could they be expected to have the *extra* vitality a cow ought to have as she approaches the severe strain of calving.

Thousands of dairymen have learned the value of special assistance at this critical time. They have found that by giving a tablespoonful of Kow-Kare with the feed two weeks before and after calving, the cow freshens without trouble of any sort and produces a vigorous calf.

Kow-Kare has saved hundreds of dollars for many cow owners at calving time. For over thirty years dairymen have used this famous medicine for treating cow troubles and for increasing milk-flow.

Our free book, "The Home Cow Doctor" tells the important part Kow-Kare plays in the treatment of Barrenness, Retained Afterbirth, Abortion, Scours, Bunches, Milk Fever, etc. Write for your copy.

Kow-Kare is sold by feed stores, general stores and druggists—or we send it by mail, postpaid. $1.25 and 65c sizes. Order a can today.

Beekeeping

THE man who wishes to make a start in beekeeping may buy full colonies near home or hives may be fitted up and new swarms hived in them by some neighbor beekeeper. Or combless packages of bees may be purchased from parties who specialize in bees for sale. If a good beekeeper living near has full colonies of Italian bees for sale, free from disease and properly wintered, this is undoubtedly the best way to start. In case box hives of black bees are purchased they must be transferred and requeened. This can be done by the beginner if he follows the instructions that will be given under the head of "How to transfer bees."

In some localities farmer beekeepers allow dozens of swarms to go to parts unknown. If modern hives are fitted up with full sheets of foundation and taken to the farmer he is usually willing to hive swarms into them at a very reasonable price. Such swarms usually build up rapidly and make good colonies having a full set of fine new combs. They should be requeened with young Italian queens as soon as they have a brood nest well established. If a heavy honey flow is on at the time that the swarm is hived, a surplus super or another full depth hive body, containing full sheets of foundation, should be given before the brood nest becomes crowded. In many seasons such a swarm will store sufficient surplus honey to pay for the whole outfit.

Removing the Hive

It is best to leave these colonies right where they were hived until fall before moving them home. However, if the farmer insists on having them moved or if the location is too inconvenient, they may be moved as soon as the new combs are fully built. Usually the weather is warm at this time and the hive should be screened over the entire top to prevent suffocation from the heat generated by the excited bees, while being moved.

At this time of the year bees should be moved away more than two miles. Otherwise many of the field bees will return to the former stand and be lost. Numerous shippers of combless package bees advertise in the bee journals. Most of these breeders make successful shipments, especially if located where the bees are shipped before they have been worn out by working in a heavy honey flow. In any case whether buying bees or queens it is always best to have the shipping distance as short as possible so that the wear and tear of travel may be at a minimum.

Before the package of bees arrives have a hive all ready for it fitted up with full sheets of foundation, or better still fully drawn combs, and if possible at least one comb containing some honey and brood. Unless such combs can be secured from bees that are known to be free from disease this plan should not be considered.

Care of Bees Upon Arrival

When the bees arrive place them in the cellar or other cool and dark place and paint the screen covering of the cage liberally with sugar syrup made of about half and half granulated sugar and water. Do this several times or as long as the bees seem hungry and lick up the syrup readily. Care must be taken not to daub the bees badly. After the bees have fed heavily they will be less inclined to become excited and to swarm out while being introduced into their new home. The introducing is best done near night fall.

To introduce remove the cover from the hive and take out part of the frames. With a sudden bump jar the bees down to the lower end of the shipping cage and pry off the top board. In most cases the queen will be found in a queen cage hung by a wire at the top of the shipping cage. Remove the queen cage and replace the cover board. Remove the tin covering the candy at the end of the queen cage and hang the cage by the attached wire to the side of the frame next to the open space in the hive. If a frame of brood and honey is used it should be this outside frame.

Now Give Them Another Shake

Again jar the bees to the lower end of the shipping cage place it on its side in the empty space in the hive, quickly remove the cover having the opening of the cage near the queen. Place on the hive cover and let them alone until the next morning. The hive entrance must be reduced to not over one inch long until the bees settle down. It should later be enlarged as the bees show signs of needing more entrance room.

If no honey flow is on nor combs of honey available then daily feeding must be done until the honey comes. Use syrup made of half and half granulated sugar and water. It should be given luke warm and so feeding will be attended with less disturbance and danger of robbing by neighboring bees if done in late evening.

An examination should be made the next morning after the package is placed in the hive. If part of the bees are covering the queen cage disturb them as little as possible. Jar out the remaining bees from the shipping cage into the hive and take the cage away. Fill the hive with frames and do not examine it again for five or six days. If feeding has to be done in the meantime disturb the bees as little as possible while doing so.

After Five or Six Days

At the end of five or six days the queen should be out of the cage and laying eggs. If she is still in the cage and the candy is found to be hard an opening should be made thru the candy large enough for the queen to come out and the cage hung back in position and left alone for the queen to come quietly out. In that case another examination should be made in about forty-eight hours. If a frame of brood has been used destroy all queen cells that the bees may have started while the queen was delayed in being released.

If on the arrival the queen or the bees are found to be in bad condition the shipper should be notified and claim for replacement made at once.

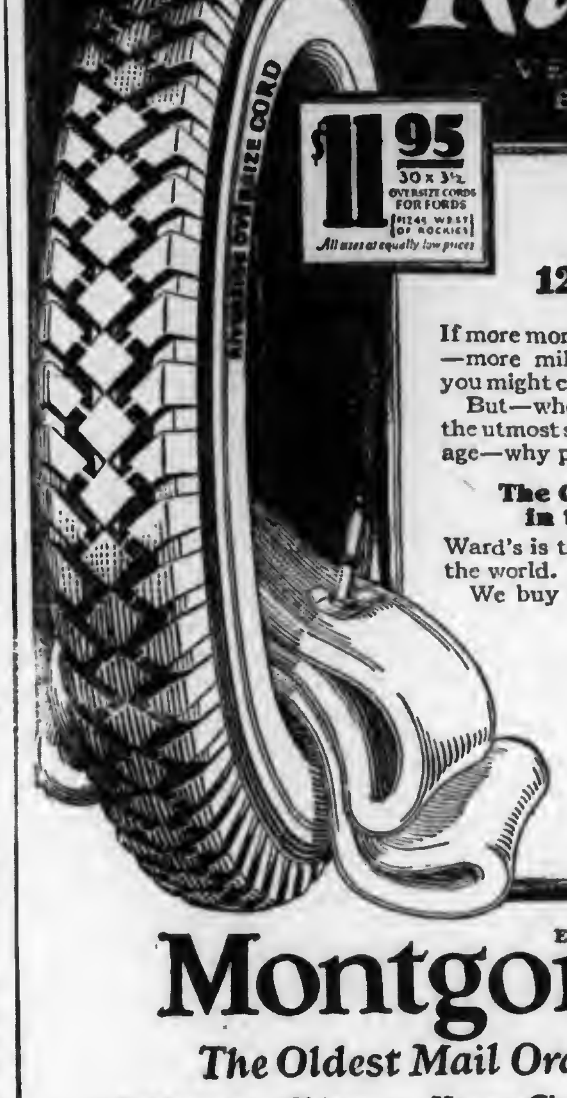
It is not advisable to purchase a package of less than two pounds of bees and a three-pound package is better. A pound of bees contains about 5000 individuals and three pounds make a very good swarm. Surplus honey should not be expected the first season from colonies built up from package bees, altho they sometimes do produce some surplus if the season is especially good for honey production.—George H. Rea.

"Hard at it, Mrs. Gray?"

"Yes, Mrs. Blucher, this is my washing day, and looking after a family of ten doesn't leave much time on my hands."

"Is that Kitty's voice I hear at the piano in the parlor?"

"Yes, that's her. I don't know how I'd get along without that girl. Always on these days she picks out her nicest pieces, like 'Sweet Rest By and By,' 'Mother's Growing Old,' 'Love Will Roll the Clouds Away,' and sings them for me while I'm running the clothes thru the first water. 'Tain't every girl who'd be so thoughtful, I can tell you."



Riverside Tires & TUBES
OVERSIZE CORDS BALLOONS

Your Saving is One-third
12,000 Miles Guaranteed on Oversize Cords

If more money would buy *more quality*—more miles of satisfactory service—you might consider paying a higher price.

But—when a "Riverside" gives you the utmost service—the last yard of mileage—why pay more money for a tire?

The Greatest Tire Value in the Whole World

Ward's is the largest retailers of tires in the world.

We buy our own new live rubber in the Orient—millions of dollars' worth at a time.

Riverside Tires are made in our own molds, under our own personal inspection. They are bigger, heavier, and stronger because we put into them more strength—more new live rubber, the finest materials.

A Fully Guaranteed Quality Tire

"Riverside" is a Quality tire. The low price is made by the lower cost of selling and not by saving on materials or labor. We use the finest quality materials—and guarantee Riversides equal to tires selling for $5 to $15 more.

A 54 Year Old Guarantee

Since 1872 Montgomery Ward & Co. has been dealing with the American public under an iron clad guarantee. We could not put our guarantee back of this tire unless exceptional quality was put into the tire.

You cannot buy a tire with a better, older, more responsible name and guarantee. So why pay more money? Why not save one-third on your tires, too?

A Standby of Grandmother's

Molasses, a Safe Sweet, Can Be Used Many Ways

WE AMERICANS are noted for our enormous consumption of sweets and for many diseases which are at least aggravated by eating them. Among these diseases are diabetes, rheumatism, defective teeth and impaired digestion.

It isn't always easy to change the food habits of a family, particularly a family of adults, but I know from experience that it is possible to do so to a worth while extent, by persistent effort. I know that I have changed my own food habits and have acquired a liking for foods I never used to eat. In the case of small children, a mother can usually form their food habits to a large degree if she uses tact and patience.

Has Lately Fallen into Disuse

Molasses is a wholesome sweet that used to be depended upon by our grandmothers as one of their culinary standbys, but which of recent years seems to have fallen largely into disuse. Yet, as we study nutrition, we learn that molasses is one of the sweets we may safely give our children and families. It is rich in vitamins and minerals and is, in addition, much less injurious in every respect than refined forms of sugar.

Perhaps the taste for molasses will have to be acquired so we should begin its use judiciously. "Richard will not eat molasses cookies," said the mother of a very small boy, a baby by the way, who suffered almost constantly from faulty elimination. "Not if he is allowed to choose his variety of cookies," we said. "But why not try offering him only molasses cookies and see what he will do?"

After a time or two he did exactly what might be expected; his desire for sweets made him accept the molasses cookies, and presently this simple change in diet had quite done away with his chronic affliction.

SWEET BREAD

Here is a wholesome sweet bread that delights most children and adults and helps to meet the demand for something sweet. Mix together two cups of sour milk, one cup molasses, one teaspoon each of soda, salt, four cups of graham or whole wheat flour and, if desired, a cupful of chopped nuts and raisins. Last of all, break in two eggs and beat hard. Bake one hour. This is good either hot or cold. Most children will like this bread in their school lunch in place of frosted cake and they like it broken into a bowl of milk for supper.

BOSTON BROWN BREAD

Boston brown bread is especially wholesome. Here is a reliable rule for making it. Sift together one cup each of white flour, corn meal and graham, one teaspoon of salt and two of soda. Add two cups of sour milk and one of molasses. Mix well, turn into a greased mold and steam three hours.

MOLASSES SPONGE CAKE

A molasses sponge cake is as delicious as it is easy to make. Cream together one-half cup of sugar—preferably brown—one-half cup of shortening, a pinch of salt and one teaspoon each of ginger and cinnamon. Add one-half cup molasses and two unbeaten eggs and beat very hard. Add two cups of pastry flour sifted with one teaspoon of soda and last of all, one-half cup of boiling water. Bake carefully in a moderate oven.

This light, delicate cake is excellent eaten at once. Served with a spoonful of whipped cream it is a dessert de luxe. And if allowed to ripen for a few days it seems almost better than ever!

MOLASSES COOKIES

This old-time molasses cookie recipe is worth a trial. Cream one cup of shortening with one and one-half cups brown sugar. Add one egg, one cup molasses, one teaspoonful each of cinnamon, ginger and salt, one-half cup of strong hot coffee and one teaspoon of soda. If a soft cookie is desired, stir in flour to make a soft dough and set away to cool and ripen for several hours or over night; mix as soft as can be handled. If cut out and baked as soon as mixed a rather hard, snappy cookie will result. They are good either way.—Alice Margaret Ashton, N. Y.

"Do" Instead of "Don't"

DO IS much better than "Don't" in all forms of discipline. Best results are obtained by speaking to our children of the splendid qualities of those with whom we wish them to mingle, rather than prohibiting too strenuously the friendships with some less desirable.

I have found that forbidden fruit always allures. Our children wonder why it is forbidden and in some manner usually find out for themselves. They do not mean to disobey, but curiosity compels. Too often this "seeing" is not at all displeasing at first, but it may become so later. We must keep young ourselves and surround our children with the best environment possible, for you know "evil associations corrupt good manners."—Clarice Raymond.

Waxing Paper Flowers

DEAR EDITOR:—Will any reader of our Home Page please give instructions for waxing crepe paper flowers? I hope the advice will help others, too, who are doing this art work.—Mrs. A. G. B.

Melt one sheet of paraffin and to this add a solution made of one large tablespoon of salt, and two tablespoons of water. This solution is sufficient for dipping one-half dozen roses.

The paraffin can be purchased from any drug or grocery store. We understand AA paraffin is preferable, but not absolutely necessary.

Little Cakes for Easter

A WISE neighbor lady prepared a never-to-be-forgotten little dinner for her little ones, with my sister and me as company, once in my childhood days. She did it all in such a happy manner I can picture her now, smiling at us over the quaint table—merely a box covered with a snowy white cloth.

She was a busy farm mother with five rollicking healthy youngsters when she spread that little dinner for us at the close of a glad spring afternoon out in the shade upon a wide grassy lawn.

Only clear, cold water to drink; tiny slices of buttered bread; yellow, juicy Bell Flower apples at each plate, their racy perfume vieing with individual "baby" cakes. Never shall I forget those alluring cakes. They were miracles to my childish mind. How she thought to make them just for us!

So now, just before Easter, I purchase at the candy store prim brown birds so real; fat chocolate eggs and the enticing bunnies with big alert ears, all significant in their own way of the happy Easter, then by and by tiny cakes are iced and bedecked with these life-like likenesses.

They cost but a penny apiece. The dough is not rich, expensive nor hard to prepare, and one is never quite a grown-up where little dinners with little cakes are provided for little folks every once in a while.—Gertrude Shockey, Ohio.

Life-like likenesses in chocolate adorn the little cakes.

THE MEAT BILLS

Important Items to Remember When Selecting Meat for the Table

ONE of our readers who was especially interested in the article "Reducing the Meat Bills" in the issue of January 2, offers the following comments:

"You mentioned a number of ways of extending meat dishes and various combinations in which less meat is needed but do not call attention to the outstanding fact that the chief way of reducing the meat bill is to select cuts which are in less demand and yet make most attractive dishes. After several years experience in buying, I find that women as a rule do not know how to select according to nutritive value received for their money.

Certain Amount Needed for Health

"You speak of reducing the amount of meat without any specific facts as to the amount that is needed for good condition of health. Meat is one of the chief sources of protein as well as a splendid source of mineral, meat fat, and vitamins and should not be indiscriminately reduced."

Editor's Note: The readers who are anxious to acquaint themselves with scientific facts concerning meat, its proper use, selection and preparation may obtain bulletins by sending requests, enclosing a stamp for postage, to Household Editor, care of Pennsylvania Farmer, 261 S. Third St., Philadelphia, Pa.

Prize Winning Hints

THE cotton bat in one of my quilts went all to pieces in washing, and was unfit for use, altho the coverings were very good. I opened it and took out all the cotton. One of my double wool blankets was worn so thin it had been mended, and it too, did not look well. I decided to combine the two, so I slipped the blanket in the quilt cover. By laying it flat on the bed, I carefully pinned it in place, and then quilted it on the sewing machine in eight-inch blocks. I now have a warm, serviceable cover of which I am very proud.—Mrs. Clarence Hollon, Pa.

About the Contest

THIS week brought many letters in answer to the sewing contest. Nine of them emphasized one idea, pretty generally known, and five another trick in common use. If you really want a pair of new scissors, you must give us something new, something original.—Gertrude S. Stewart, N. J.

BITTER SWEETS

2 cups white sugar
½ cup water
½ teaspoon peppermint
White of one egg

Boil sugar and water until it forms a soft ball when dropped in cold water, beat white of egg until very stiff, pour boiling syrup slowly in beaten egg, beating constantly. When slightly stiff add the peppermint, drop from spoon on platter. When cool dip in unsweetened chocolate. These prove a decided success with the school girls.—A. S.

Something That Won't Wait

Take Time to Train Children While They're Small

"IF THERE is something your child should learn, take time to teach him," said an elderly lady to a group of young mothers. "And the younger he learns the lesson the better it is for all concerned.

"I realize that young mothers are exceedingly busy. But after many years of experience and observation I am most firmly convinced that these early lessons of childhood are the most important things of the moment.

"Is there one child in your little brood that doesn't learn as easily as the rest? One that seems just naturally awkward or slow or stubborn? Do not, I pray, be too hurried to stop and teach him the lesson he seems so loath to learn. Do not, because they average pretty well as a family, neglect the child that is bringing down the average.

Not Like Brothers and Sisters

"As a little child I was different from my brothers and sisters. There were seven of us and mother was, consequently, always in a hurry.

"I think I must have been naturally awkward and impatient. 'Get some water, Alice, and put it on the table,' mother would tell me. But I couldn't work the pump—which all the other children took pride and delight in doing. 'Oh, I can't make it go,' I would wail, shaking the pump handle ineffectually.

"'Get mother the shears, Alice.' 'Oh, I can't find them,' I would say impatiently; and some other child would spy them and carry them to mother.

"'Put some potatoes in the pan, Alice.' 'Oh, I do not like to touch them—they're all dirt!'

"'I never saw such a helpless child,' mother sometimes said in exasperation. But she never took time to stop right then and make me do the thing she had required of me. Some other child rushed in and did it—or she did it herself. 'Alice never knows how to do anything,' my brothers often taunted me.

"As I grew older I liked to read and study and made a good record at school. And I continued to slip out of all responsibility at home. Mother, still hurried by her many duties, seldom asked me to do anything except the simplest tasks because she was so tired of hearing my impatient cry: 'Oh, dear, I can't!'

"For years I went on, dreading to face the tasks that all my brothers and sisters accepted as a matter of course. At last I saw how this conduct was cutting me off from most of the enjoyments of life and set about to overcome my weakness. But it has been a long, hard lesson and never will be as effectually learned as if it had begun in my early childhood. If mother had insisted upon my doing the things she required of me I would soon have learned."

Because Maurice is quick and willing see that he isn't always the one to do your bidding; see that Mary takes her turn even tho she may be slow or awkward or rebellious. It will take more time today but it will save Mary many a hard lesson later in life.

Never be too busy to take time to train your little ones while they are little and entirely your own.—Alice Margaret Ashton, N. Y.

The small boy's head bobbed up over the garden wall, and a meek little voice asked: "Please, Miss Brown, may I have my arrow?"

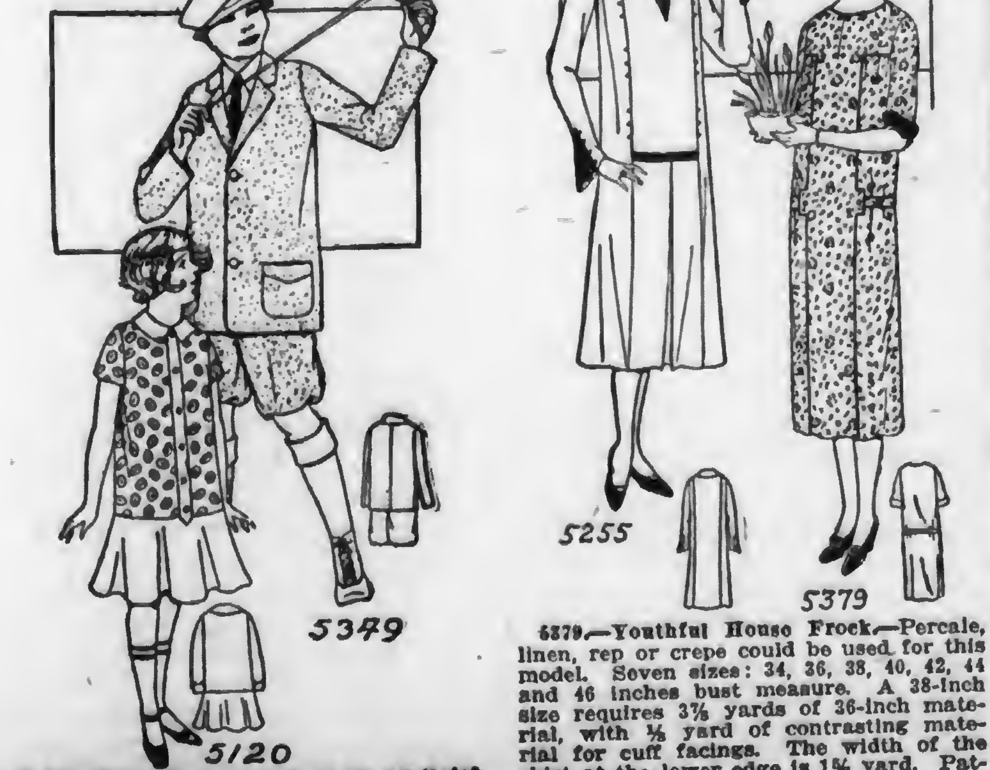
"Yes, dear, certainly," the next door neighbor answered, beaming. "Where did it fall?"

"I think," was the reply, "It's stuck in your cat.

For Mother and the Children

Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

5120.—A Stylish Dress.—Printed and plain voile are combined in this pretty model. One could use gingahm in any of the new checks or tub silk, piped with a contrasting solid color. Four sizes: 4, 6, 8 and 10 years. An 8-year size requires 2⅞ yards of 32-inch material, if made of one material. To make as illustrated requires 1¼ yard of figured material and 1⅝ yard of plain material. With long sleeves 1½ yard of figured material is required. Pattern, 10 cents.



5349.—A Suit for the Boy.—Serge, wool mixtures and corduroy may be used for this design. Four sizes: 8, 10, 12 and 14 years. A 12-year size will require 2⅝ yards of 54-inch material. Pattern, 10 cents.

5255.—A Flare Model.—Crepe in a tan shade with trimming of brown silk was used for this design. This style is good also for kasha, jersey weaves and taffeta. Seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 4¼ yards of 40-inch material with ⅝ yard of contrasting material for trimming as illustrated. Pattern, 10 cents.

5379.—Youthful House Frock.—Percale, linen, rep or crepe could be used for this model. Seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size requires 3⅞ yards of 36-inch material, with ⅓ yard of contrasting material for cuff facings. The width of the skirt at the lower edge is 1⅝ yard. Pattern, 10 cents.

Send 10c in silver or stamps for our up-to-date spring and summer 1926 Book of Fashions.

NO WASTE

BEST BY TEST

No waste, when you buy Calumet. It's the finest leavener at the fairest price.

No waste, when you use Calumet. It has unusual leavening strength. Only half the ordinary amount is required. You never increase the quantity because it never decreases in leavening action.

No waste of baking materials. It never fails. Every baking comes from the oven light, evenly raised and wholesome.

Ask for Calumet. Stop all waste—all worry—all uncertainty.

Every ingredient used officially approved by U. S. Food Authorities.

A PADDY PARTY

Some Fun for Those Planning a St. Patrick's Day Celebration

A PADDY PARTY to be given on St. Patrick's Day, March 17, could not help but be merry. How could one be stiff or glum at a table all decorated in Irish green, or keep a straight face thru the merry games which this celebration is sure to bring forth?

You might send your invitations like little high hats. Cut them from stiff shiny black cardboad or paper making the crown part double so that the invitation can be written inside.

For decorations use snakes, shamrocks, potatoes, pipes, tall hats and pigs. Shamrocks can be cut in large quantities from green tissue paper or cardboard, and strung on gold cord around the room. They can be hung at different lengths in the doorways for portieres.

A Sight-seeing Tour

To give variety to the party, take the guests on a sight-seeing tour thru Ireland. There will need to be a jaunting car, of course, and this may be that old but always amusing stunt of trying to keep balanced in a clothes basket swung between two chairs by putting an umbrella or broomstick thru the handle. Each guest must take his turn in the jaunting car, and must be required to pick three shamrocks off the back of a chair just within reach. If the party needs any livening up, this stunt will be sure to do the trick.

The first stop is Blarney Castle. Here the guide points out the Blarney Stone, which each guest must kiss. This is a piece of cotton marked off into stones, with one painted green in the center. This is then hung on the wall, and each guest must try to kiss the Blarney Stone by standing about two feet away from the wall and bending backwards until he or she actually kisses the green spot in the muslin.

A good guessing game will add variety to the evening's events. Try the following:

Ten Pat Answers

The Pat which destroyed the hole—Patch.

The Pat that is imitated—Pattern.

The Pat of high birth—Patrician.

The Pat as old as the hills—Patriarch.

The Pat who is hard to keep.—Patience.

The Pat who protects your ideas—Patent.

The Pat who gives you a free ride—Patrol.

The Pat who loves his country—Patriot.

The Pat who is like his father—Paternal.

The Pat that is heard in the nursery—Patter.

For the center of the table from which the refreshments are served, use a tall hat turned upside down and filled with a fern-dish of shamrocks. If you can get an old hat, it would be unusual to slit it in several places and let some of the natural shamrock leaves poke thru the holes. Pass around plates on which you have green peppers, stuffed with mashed potato salad, with sprigs of parsley "growing" in it, brown bread and butter, sandwiches with very thin slices of tongue or corned beef between the bread, coffee, poured for a tea pot, ice cream colored green, or flavored with pistachio nuts, and small cookies cut in the shape of harps, shamrocks, pipes and pigs.

The crepe paper counter of any large department or stationery store will furnish a booklet containing many helpful suggestions. It is possible to buy the tablecloth with its bright shamrocks and harps ready to spread on the table, napkins to match and frilly nut caps trimmed with harps. Green crepe paper and shamrocks made of cardboard may be easily converted into a stunning center decoration. Appropriate favors such as pots of shamrocks, clay pipes and miniature harps may be concealed in the ruffles of the centerpiece.

It is lots of fun to dress up for a St. Patrick's party. There are so many ideas which may be carried out. The "real Irish colleen" may be the model for the ladies, or they can go to the Irish folklore for ideas and represent a "pixy" or a "fairy," or may be quite up to date in a crepe paper costume made on the sewing machine and trimmed with shamrocks and other emblems pasted on. The young men may safely follow the plain Paddy type, which has sufficient latitude to please the most particular. Whether the party be large or small, we are sure there is going to be plenty of fun.—Earle W. Gage, N. Y.

Animal Cookies

ALL children love animals, and when animal cookies are in evidence, there are folks of many years willing to be children. With the approach of the Easter season, I wish all the children of all the world could be made happy by some one.

Will you give just a few moments of your already filled program to think of the less fortunate? There may be a family of shut-ins near you. Perhaps six of the Smith children living across the fields have measles. You may be fortunate enough to have a hospital in your county. If you are, I am sure there is a children's ward. How the children would relish a box of animal cookies! And how about the Home for Orphans? I have an idea those youngsters would grin from ear to ear should you walk in with such a treat. Why not do it? Such loving service would set the Easter joy bells ringing in your hearts!—Gertrude S. Stewart, N. J.

Mid-Winter Preserving

WITH one bottle of commercial pectin, and a few good things from the fruit cellar, today I replenished my stock of spreads. The supplies used contained some pectin so I needed but half the amount specified.

I

1 pint can red raspberries
3 cups sugar
¼ bottle pectin

Boil rapidly for 5 minutes; 4 large glasses jam.

II

1 pint can purple raspberries

Other directions same as in number I; 4 large glasses jam.

III and IV

With the remaining half bottle I followed the recipes provided with the pectin and made delicious marmalades, one of oranges the other of grapefruit, nine large jars. Now I feel pretty well fixed again for sandwich spreads, and goodies for toast and muffins.—Mabel G. Feint, N. Y.

Stretching Potatoes

WHEN the potatoes you intended to reheat in some way seem too few here are two satisfactory ways of stretching them.

Chop the cold potatoes rather coarsely and with them chop a quantity of bread from which the crust has been removed. Brown delicately in butter and the bread will be found an improvement.

Or, chop the potatoes and to them add a quantity of broken crackers, season, add a liberal amount of butter and over all pour enough thin cream or rich milk to partly cover. Cover closely and cook slowly until the cream is absorbed.—Alice Margaret Ashton.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., discovered a process of making a new kind of paint without the use of oil. He named it Powdrpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much. Write to A. L. Rice, Inc., Manufacturers, 114 North St., Adams, N. Y., and a trial package will be mailed to you free, also color card and full information showing you how you can save a good many dollars. Write today.

MONEY SAVING PRICES
The Lombard Mail Order Company

Free! America's Greatest SHOE catalog

Are you getting your money's worth from the shoes you buy? Can those same shoes, or better shoes, be bought for less money elsewhere? You can't answer these questions until you've ordered this Money-Saving Catalog. We're specialists in shoes, and we are America's Great Mail Order Shoe House. That's why our values are unmatched in all America.

The coupon below—or a postal—will bring this wonderful shoe catalog. As soon as you open it, you'll see values that will amaze you. Just think—

SHOES FOR BABIES - - 49c up
SHOES FOR CHILDREN - 99c up
SHOES FOR BOYS - - - $1.69 up
SHOES FOR MEN - - - $1.98 up
SHOES FOR LADIES - - $1.98 up

We have startled thousands by these low prices, which become possible only because of our enormously large sales.

Satisfaction Guaranteed or Money Refunded

Thousands of satisfied customers—some right in your own neighborhood, probably—can tell you how well satisfied they are with "LOMBARD" Shoes, "LOMBARD" Service and "LOMBARD" Fair-dealing.

BUY FROM AMERICA'S GREAT MAIL ORDER SHOE HOUSE!

FLEXO JOINT

EXPERIENCE has taught us how to make field fence. From our long experience we have learned what is required of a really good field fence, and we have built Cambria Fence to meet these requirements satisfactorily.

In buying field fence you will look into and question the merits of the fence in the same manner that all careful buyers do, namely:

—will it actually resist rust?
—is it strong and durable?
—will it retain its neatness and newness?
—will it string evenly and tightly?

In Cambria Fence you will find every feature a good fence should have. Buy it. Ask your dealer for New Cambria Fence Catalog

OUR YOUNG PEOPLE'S FORUM.

Cousin Ruth's Letter

DEAR FORUM FRIENDS:—Nearly 7000 boys and girls carried on projects in the vocational schools of the Keystone State during 1925. Isn't that fine? Now I'm anxious to know how many Forum friends helped make up that grand total. Few of you ever mention "projects" but I'm hoping that's not because you aren't interested. I'd hate to think we weren't well represented in this big work. What a lot of fun those 7000 must have had mixed in with the work of raising pigs and potatoes and flowers, and all the many other things found on farms.

When the State Farm Products Show was held in Harrisburg in January the boys and girls whose projects had been judged the best thruout the state were awarded medals. Those in high schools, senior project winners, received gold medals and those in grammar schools, junior project winners, silver medals. Five boys and one girl won the silver medals and, thinking you would like to hear how they won the honors, I asked them to tell you about their projects. So, on the page this week, you'll find stories from four of the six junior winners. Unfortunately there isn't room this time for the pictures and stories of all six. Next week the other two will have a chance to tell you what they did to make themselves famous!

I hope you will enjoy these stories as much as I have and if you don't already know anything about project work in vocational schools will let me know—or if you've been enrolled in the work will tell Forum friends about the trials, tribulations and fun you had.

Has everybody hunted up the words for the blank spaces in the incomplete sentences printed on the page last week? Don't forget about the contest and be sure to have your answers reach me before March 13th, addressing them to Cousin Ruth, care of Pennsylvania Farmer, 261 S. Third St., Phila., Pa.

COUSIN RUTH.

From Junior Project Winners

THE Junior Project for which I received the silver medal was about 150 square feet planted in asters and sweet peas.

I started the asters in the greenhouse in flats, I planted them in the plot of ground. I took good care of them and hoed and watered them very carefully.

When my asters grew up so that I could pick flowers from them I began shipping them to Philadelphia. I had one plant that gave me about thirty or thirty-two flowers.—Ruth Breckbill, Lampeter Vocational School, Lancaster County, Pa.

I AM writing a short story of my potato project which I carried on this last year.

My father plowed and got the half acre of ground ready for planting. He said that he would trust me until fall when I would get some money. So he bought me certified seed and I stayed home from school to plant them.

During the summer the potatoes were worked and hoed three times. At the last working they were hilled up and nothing more needed to be done until raising. During the growing time, I looked at them several times. I thought they were going to turn out pretty good.

This fall I hired four men and raised them in one day. A good many of the potatoes were sold retail at the price of $1.75 a bushel. Some, however, were sold at $1.25 a bushel. When I counted up my expenses, I found that my entire profit was $88. I am putting this money in a bank on interest so that I shall have something when I grow up.

This was the first year that I have taken agriculture and I expect to continue next year when I go to high school. What I have done is what almost anyone can do, provided, of course, he really wants to.—Stewart M. Ross, Lightcap Vocational School, Westmoreland County, Pa.

JUST a few lines to tell you about my project. I am very well pleased with my success. I am a boy eleven years old. By the supervision of Mr. Carey, a teacher at West Lampeter Vocational School, I succeeded in winning a medal at the State Farm Products Show and also a first prize ribbon at our community fair.

My father bought me six small pigs. They were so small they would only eat a hand full at a meal. In a short time they began to grow and when I was thru with them I paid for the pigs and feed and had $80 profit in eight months. I kept a record of all labor and all feed expenses.

I did most of the labor myself. This was required in order to enter the contest. This is my first letter to the Forum. I enjoy reading the letters on the Forum page.—Clarence Smith, Rockvale Vocational School, Lancaster County, Pa.

MUCH of my success is due to my father who donated the chicken house to me because he tore down the old barn in which I had my chicken house before. I had fixed up the old place by my own efforts but had kept my chickens there only about six months when my father tore down the old building to make the new garage. I put my chickens in the new building in December. My project was to begin in January.

The first few weeks of January were very bad and I had to have the lights on all day. In the latter part of January the hens went into a molt. When I looked over my accounts, I found I had little margin left for myself.

The agricultural supervisor visited me six times and helped me if I had problems I could not solve. He told me to whitewash and spray my chicken house so I did as he advised me and profited by it.

During the summer I went out to work every day. Before I left in the morning, I fed my chickens some green feed. At noon I fed oats that had been soaked in water overnight and mixed with mash that contained no beef scrap. In the evening, I fed scratch grains. I also kept mash before my chickens at all times. My mash contained beef scrap, chopped oats, rolled oats, middlings, corn chop, corn meal, wheat bran and dried buttermilk. In June I started to cull my hens and kill the non-layers. I also killed the old ones.

ANDREW K. LEIDY
Montgomery County, Pa.

House Was Too Warm

In the summer the chickens all roosted in the trees because it was very warm in the chicken house. I let them sleep in the trees because it was much cooler there.

I got up every morning to scrape the dropping boards. I painted the outside of the building myself and cleaned the floor four times during the time of my project. Each time I cleaned I sprayed and emptied the nests and put new straw in them. Any boy who wishes to make a success in the chicken business can do so if he cares to do the work attached to it.

If a person keeps the house clean he will have no trouble with disease. Only two hens died for me in six months. I expect to take out another project next year and again attain success. If a person takes a little care he will have no trouble.—Andrew K. Leidy, Hatfield Consolidated School, Montgomery County, Pa.

OUR LITTLE FOLKS' PUZZLE CORNER

DEAR LITTLE FOLKS:—This is a queer looking message for a detective to find as he starts to work on a case. You will be able to read it, tho, if you are not fooled by the division into words—sometimes the spaces come where the words don't end. At any rate the message is a good one to remember when once you have solved this mystery. When you have found the answer send it to me on a POSTCARD so that it reaches me by March 13th. BE SURE TO SAY HOW OLD YOU ARE. The ten children sending in the correct answer, whose cards are the best in grammar, spelling, punctuation, penmanship and general appearance will each be awarded a set of pictures.

The Honor Prizes, bright and shiny pencils with a supply of leads, go to those Little Folks who send in correct, excellent answers to ten puzzles for ten straight weeks without missing,—one each week. Please remember that in order to win an Honor Prize your answers must be absolutely correct each week. Mistakes in spelling, punctuation, and failure to mention your age every time are only a few of the many errors that are made weekly.

Address all replies to the PUZZLE EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

The answer to the puzzle published in the February 13 issue of Pennsylvania Farmer is: BE MY VALENTINE.

The puzzle prize winners are: John Davison, age 10, Chambersburg, Pa.; Grafflin Day, age 8, Trappe, Md.; Sara Gelvett, age 10, Millerstown, Pa.; Mary Eleanor Johnston, age 10, Canonsburg, Pa.; Gertrude Mersman, age 10, Cologne, N. J.; Lucille G. Musselman, age 10, Fairfield, Pa.; Elias Spengler, age 11, Bath, Pa.; George H. Spotts, age 9, Landisburg, Pa.; Ruth Whitcraft, age 10, Parkton, Md.; Charles Wilson, age 11, Port Matilda, Pa.

8.—Modeling in the snow is the latest activity inaugurated by playgrounds in Chicago. "A Horse Race," one of the entries in a recent contest in which fifty-five playgrounds participated.

ICE-BOUND HEARTS

By James Oliver Curwood

HOW THE STORY STARTED

AT POINT FULLERTON, 1000 miles north of civilization, Sergeant William MacVeigh concluded his semi-annual report to the commissioner of the Royal Northwest Mounted Police. "I have made every effort to run down Scottie Deane, the murderer. I have not given up hope of finding him, but I believe that he has gone from my territory. . . ." On his bunk in a corner of the little cabin lay his comrade, Private Pelletier, sick, almost to madness after nine months of loneliness—without a sight of other white men or women.

Half an hour later MacVeigh set out for Fort Churchill, 450 miles across the ice to deliver the report, get medicines and letters for Pelletier from the girl back home. While in Churchill a half-breed brought word he'd seen a white man and woman ten miles south of the Maguse River. A white woman in this region was unusual, her reason for being there so puzzling, that MacVeigh decided to hunt for them. Seated before his bush fire on the edge of the barren that night, he thought of Pelletier, alone on his fever-bed, of Scottie Deane, the man-hunted man, and of the girl, who unlike the writer of Pelletier's letters, had failed him. He started out again on his snowshoes. Suddenly out of the silent loneliness came the sound of sledge runners and then into sight a human figure, three dogs and a toboggan. He strode forward with a loud halloo. A white face stared at him—the face of a woman.

(Continued from last week)

FOR a moment he was unable to move or speak, and the woman raised her hands and pushed back her fur hood, so that he saw her hair shining in the starlight. She was a white woman. Suddenly he saw something in her face that struck him with a chill, and he looked down at the thing under his hand. It was a long, rough box. He drew back a step.

"Good God!" he said. "Are you alone?"

She bowed her head, and he heard her voice in a half-sob.

"Yes—alone."

He stepped quickly to her side. "I am Sergeant MacVeigh, of the Royal Mounted," he said gently. "Tell me, where are you going—and how does it happen that you are out here in the barren—alone?"

Her hood had fallen upon her shoulder, and she lifted her face full to MacVeigh. The stars shone in her eyes. They were wonderful eyes, and now they were filled with pain. And it was a wonderful face—to MacVeigh, who had not seen a white woman's face for nearly a year. She was young—so young that in the pale glow of the night she looked almost like a girl—and in her eyes and mouth, and the upturn of her chin, there was something so like that other face of which he had dreamed that he reached out and took her two hesitating hands in his own, and asked again:

"Where are you going; and why are you out here—alone?"

"I am going—down there," she said, turning her head toward the timberline. "I am going—with him—my husband—"

Her voice choked her, and, drawing her hands suddenly from him, she went to the sledge and stood facing him. For a moment there was a glow of defiance in her eyes, as tho she feared him, and was ready to fight for herself and her dead. The dogs slunk in at her feet, and MacVeigh saw the gleam of their naked fangs in the starlight.

"He died three days ago," she finished quietly, "and I am taking him back to my people, down on the Little Seal."

"It is two hundred miles," said MacVeigh, looking at her as if she were mad. "You will die."

"I have traveled two days," replied the woman. "I am going on."

"Two days—across the barren!"

MacVeigh looked at the box, grim and terrible in the ghostly radiance that fell upon it. Then he looked at the woman. She had bowed her head upon her breast, and her shining hair fell loose and disheveled. He saw the pathetic droop of her tired shoulders, and knew that she was crying.

In that moment a thrilling warmth flooded every fiber of his body, and the glory of this that had come to him from out of the barren held him mute. To him woman was all that was glorious and good. The pitiless loneliness of his life had placed them next to angels in his code of things, and before him now he saw all that he had ever dreamed of in the love and loyalty of womanhood and of wifehood.

The bowed little figure before him was facing death for the man she had loved, and who was dead. In a way, he knew that she was mad. And yet her madness was the madness of a devotion that was beyond fear; of a faithfulness that made no measure of storm and cold and starvation, and he was filled with a desire to go up to her as she stood crumpled and exhausted against the box; to take her close in his arms and tell her that of such a love he had built for himself the visions which had kept him alive in his loneliness. She looked pathetically like a child.

"COME, little girl," he said. "We'll go on. I'll see you safely on your way to the Little Seal. You mustn't go alone. You'd never reach your people alive. My God, if I were he—"

He stopped at the frightened look in the white face she lifted to him.

"What?" she asked.

"Nothing—only it's hard for a man to die and lose a woman like you," said MacVeigh. "There—let me lift you upon the box."

"The dogs cannot pull the load," she objected. "I have helped them—"

"If they can't I can," he laughed softly, and with a quick movement he picked her up and seated her on the sledge. He stripped off his pack and placed it behind her, and then he gave her his rifle. The woman looked straight at him with a tense, white face as she placed the weapon across her lap.

"You can shoot me if I don't do my duty," said MacVeigh. He tried to hide the happiness that came to him in this companionship of woman, but it trembled in his voice.

He stopped suddenly, listening.

"What was that?"

"I heard nothing," said the woman. Her face was deadly white. Her eyes had grown black.

MacVeigh turned with a word to the dogs. He picked up the end of the babiche rope with which the woman had assisted them to drag her load, and set off across the barren. The presence of the dead had always been oppressive to him, but tonight it was otherwise. His fatigue of the day was gone, and, in spite of the thing he was helping to drag behind him, he was filled with a strange elation—he was in the presence of a woman.

NOW and then he turned his head to look at her. He could feel her behind him, and the sound of her low voice when she spoke to the dogs was like music to him. He wanted to burst forth in the wild song with which he and Pelletier had kept up their courage in the little cabin, but he throttled his desire, and whistled instead. He wondered how the woman and the dogs had dragged the sledge. It sank deep in the soft drift-snow, and taxed his strength. Now and then he paused to rest, and at last the woman jumped from the sledge and came to his side.

"I am going to walk," she said. "The load is too heavy."

"The snow is soft," replied MacVeigh. "Come."

He held out his hand to her, and with the same strange white look in her face the woman gave him her own. She glanced back uneasily toward the box, and MacVeigh understood. He pressed her fingers a little tighter, and drew her nearer to him. Hand in hand they resumed their way across the barren. MacVeigh said nothing, but his blood was running like fire thru his body. The little hand he held trembled and started uneasily. Once or twice it tried to draw itself away, and he held it closer. After that it remained submissively in his own, warm and thrilling. Looking down he could see the profile of the woman's face.

A long, shining tress of her hair had freed itself from under her hood, and the light wind lifted it so that it fell across his arm. Like a thief he raised it to his lips, while the woman looked straight ahead to where the timber-line began to show in a thin, black streak. His cheeks burned, half with shame, half with tumultuous joy. Then he straightened his shoulders and shook the floating tress from his arm.

Three-quarters of an hour later they came to the first of the timber. He still held her hand. He was still holding it, with the brilliant starlight falling upon them, when his chin shot suddenly into the air again, alert and fighting, and he cried softly:

"What was that?"

"Nothing," said the woman. "I heard nothing—unless it was the wind in the trees."

She drew away from him. The dogs whined and slunk close to the box. Across the barren came a low, wailing wind.

"The storm is coming back," said Billy. "It must have been the wind that I heard."

For a few moments after uttering those words Billy stood silent, listening for a sound that was not the low moaning of the wind from out on the barren. He was sure that he had heard it—something very near, almost at his feet, and yet it was a sound which he could not place or understand. He looked at the woman. She was gazing steadily at him.

"I hear it now," she said. "It is the wind. It has—frightened me. It makes such terrible sounds at times—out on the barren. A little while ago—I thought—I heard—a child crying—"

Billy saw her clutch a hand at her throat, and there were both terror and grief in the eyes that never for an instant left his face. He understood. She was almost ready to give way under the terrible strain of the barren. He smiled at her, and spoke in a voice that he might have used to a little child.

"You are tired, little girl?"

"Yes—yes—I am tired—"

"And hungry and cold?"

"Yes."

"Then we will camp in the timber."

They went on until they came to a growth of spruce, so dense that it formed a shelter from both snow and wind, with a thick carpet of brown needles under foot. They were shut out from the stars, and in the darkness MacVeigh began to whistle cheerfully. He unstrapped his pack and spread out one of his blankets close to the box, and wrapped the other about the woman's shoulders.

"You sit here while I make a fire," he said.

He piled up dry needles over a precious bit of his birch-bark, and struck a flame. In the glowing light he found other fuel, and added to the fire until the crackling blaze leaped as high as his head. The woman's face was hidden, and she looked as tho she had fallen asleep in the warmth of the fire. For half an hour MacVeigh dragged in fuel until he had a great pile of it in readiness.

THEN he forked out a deep bed of burning coals and soon the odor of coffee and frying bacon aroused his companion. She raised her head and threw back the blanket with which he had covered her shoulders. It was warm where she sat, and she took off her hood, while he smiled at her companionably from over the fire. Her reddish brown hair tumbled about her shoulders, rippling and glistening in the fire-glow, and for a few moments she sat with it falling loosely about her, with her eyes upon MacVeigh. Then she gathered it between her fingers, and Billy watched her while she divided it into shining strands and plaited it into a big braid.

"Supper is ready," he said. "Will you eat it there?"

She nodded, and for the first time she smiled at him. He brought bacon and bread and coffee and other things from his pack, and placed them on a folded blanket between them. He sat opposite her, cross-legged. For the first time he noticed that her eyes were blue, and that there was a flush in her cheeks. The flush deepened as he looked at her, and she smiled at him again.

The smile, the momentary drooping of her eyes, set his heart leaping, and for a little while he was unconscious of taste in the food he swallowed. He told her of his post away up at Point Fullerton, and of Pelletier, who was dying of loneliness.

"It's been a long time since I've

Old Colonial Family Homesteads

No. 40—The Boyce Farm

RICHARD BOYCE, a Quaker, a native of Ireland, farmer by occupation, landed in Philadelphia, Pa., and located in Virginia for a short time, then moved to Kentucky and later settled in the Shenandoah Valley, Virginia. It is supposed his constant change was due to his religious views, not wishing to oppose the Indians.

In 1793 he came to Allegheny County, Pa., purchased a farm from Joseph Shipper, Jr., of 400 acres on the west side of Chartiers Creek where he lived until his death at the age of 104 years.

One hundred and twenty-five acres of this land was willed Isaac Boyce, a farmer and miller by trade, who died at the age of ninety-six years. Forty acres of that was willed to his son, Joseph Boyce, farmer and carpenter, who enlisted in Company K. First Pennsylvania Cavalry and was honorably discharged in 1862.

These forty acres were willed to his son, W. F. Boyce, farmer and dairyman and present owner. No buildings are on this land as Joseph Boyce bought a farm of ninety acres adjoining it.—Tamar Park Boyce.

No. 41—The Koehler Farm

MY FARM is in Hanover Township, Northampton County, three miles north of Bethlehem. My great grandfather, Stephen Koehler, was the first owner, he was born in 1749, then it came to my grandfather, John Koehler, born in 1777, then it came to my father, Conrad Koehler, born in 1810, then it came to me. I was born in 1849. I am retired but my son is farming and he has two boys that help him. There are about 140 acres in the farm. No others have farmed this farm since it has been in the name of Koehler.

The last barn was built by my grandfather in 1826, a stone barn, and is today nearly as good as when it was built. The third or fourth house was built in 1842.

I have a paper with my great grandfather's name on it printed in 1806, June 4th. I also have other papers over 100 years old. I have a chest with the year 1774 on it. My great grandmother got it before she was married. I have no pictures of the buildings.—Milton H. Koehler.

No. 42—The Shoemaker Farm

THE farm on which I and my family are now living has been occupied by Shoemakers since 1790. It is located at Deerfield, Cumberland County, New Jersey.

The date of the deed given to Henry Shoemaker is March 10, 1790, altho he lived on and operated the farm before and during the Revolutionary War, 1776. Often his team carried provisions to Monmouth for the army.

The farm passed from Henry Shoemaker to Enoch Green Shoemaker, to Grandmother Sarah Shoemaker, to Horace B. Shoemaker, to Paul Beck Shoemaker, present owner and farmer.—Paul B. Shoemaker.

No. 43—The Kerper Farm

MY GRANDFATHER was John Kerper. He was born March 14, 1783, and bought this farm May 20, 1812, and lived on it until 1843. After his death father took the farm in 1844. My father's name was also John Kerper. He was born October 11, 1819, and lived on the farm until his death, and I, one of his daughters, have lived on the farm since my father's death in 1888.

When my grandfather bought the farm there was an old log house and little log barn. In 1874 my father built an eight-room brick house and in 1887 he built a new barn. This is the second barn he has built since he has had the farm. The first barn was struck by lightning and burnt to the ground.

The farm is situated one-half mile from Birdsboro Station, Berks County, Pa. The ground lies along the Philadelphia and Reading Railroad.—Mrs. A. Trout.

News and Notes

ONE of the large express companies has asked permission of the Public Service Commission to raise its rates on baggage. One of the reasons given is that there is no money in the business of handling baggage since women started wearing a kind and quantity of clothing that enables them to carry their belongings in handbags. They traveled with trunks in the old days when a dress required twenty instead of three or four yards of material.

* * *

Abraham Lincoln was six feet four inches tall. One time he bought material for a new pair of trousers by splitting 400 rails for each yard of cloth.

* * *

Inhabitants of the far North get part of their living by catching birds which fly in swarms so close to the cliffs and mountains that the Eskimos catch them in nets. Sometimes two or three birds are caught at once when the hoop net, on the end of a long pole, is swung thru the air.

* * *

Dr. Russell H. Conwell died recently leaving an estate of only $9000. He was the author of the lecture, "Acres of Diamonds," which he delivered over 6000 times. He received a salary of about $10,000 a year as pastor of a Philadelphia church. His many books and his lectures brought him millions of dollars, practically all of which he contributed to the support of educational and religious institutions and hospitals, several of which he founded.

* * *

One of the large harvester companies still sells about 450 of the old fashioned dump reapers every year. These machines are used principally for harvesting flax and some of the seed crops which shatter badly when cut with a binder.

* * *

The champion horseshoe pitcher of the United States is a nineteen-year-old Iowa boy. At a distance of forty feet he has tossed eighteen ringers with twenty shoes. He has won a fifty-point game with twenty shoes. Just now he is playing in St. Petersburg, Florida, a winter resort where the favorite sport is horseshoe pitching in the city parks.

* * *

It is estimated that at least twelve million people will visit the Sesqui-Centennial International Exposition in Philadelphia which is scheduled to open on June 1, 1926, and continue for six months.

* * *

Says Mr. S. S. McClure: In 1924 the English people spent for liquor $1,500,000,000. In 1924 the English people spent for milk $375,000,000. The per capita consumption of milk in England is one-third that of the United States.

GOLD SEAL

Keeping Feet Dry for Over Fifty Years

Heavy Gold Seal Storm Rubber. Full double gray sole. A strong, durable work rubber. Sizes 6 to 13.

EVER since Charles Goodyear discovered how to vulcanize rubber so it wouldn't be sticky in hot weather, or get stiff and brittle when the weather was cold, people have more and more appreciated what a Godsend rubber footwear is. It saves countless lives every year by keeping feet dry and warm—prevents the many ills that come from catching cold through wet feet.

For over fifty years Goodyear "Gold Seal" rubbers, boots and overshoes have kept hundreds of thousands of feet dry and comfortable during stormy weather. "Gold Seal" goods are preferred by people who have worn all kinds of rubber footwear, because they know from experience that the "Gold Seal" trade-mark represents the most value, in terms of satisfactory wear. Demand "Gold Seal" rubber footwear. Look for the trade-mark on the goods—it is there for your protection. *You can get "Gold Seal" rubbers, boots and overshoes for the entire family.*

$5 Down and You Can Buy Any WITTE Engine *Up to 10 H-P.*

To PROVE that this "super-powered" one-profit, light weight WITTE will save you one-half the time, labor and cost of any job on the place I want to send it to you on a 30-day test at my risk. I guarantee it to do the work of 3 to 5 hired hands.

Burns Kerosene, Gasoline, Gas-Oil, Distillate or Gas— Yet Delivers 25% or More Power. Cheapest to operate and guaranteed for a life-time. No cranking required. Compact and easily moved. Double, balanced fly-wheels with throttling governor that saves money. Fifty New Features—Write Me Today—a postal will do—for my Special FREE 30-Day Test Offer.

Nearly a YEAR TO PAY

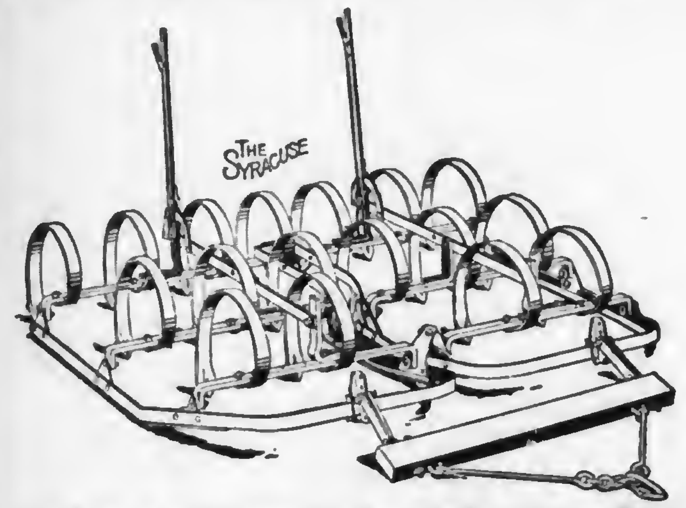
Scrap the Old One—Pay a Little of It Down on the New WITTE

With my generous terms my engine pays for itself. Increases farm profits $500 to $1000 a year. Thousands say the WITTE is ten years ahead of any other make—simple and trouble-proof at rock-bottom, direct-to-you prices. Completely equipped with WICO Magneto, speed and power regulator and throttling governor. All sizes 2 to 25 H-P.

FREE—Write me today for my big, new, illustrated engine book and full details of my guaranteed test offer. No obligation, absolutely Free. Or, if interested, ask for our Log and Tree Saw, 3-in-1 Saw Rig or Pump Catalogs.—ED. H. WITTE, Pres.

WITTE ENGINE WORKS, 2046 Witte Building, KANSAS CITY, MO. 2046 Empire Building, PITTSBURGH, PA.

When you buy John Deere Implements you are sure of prompt repair service throughout their long life.



It's a Double-Duty Harrow

In difficult fields where weeds are abundant, the John Deere-Syracuse Spring-Tooth Harrow proves its real worth.

The carbon steel teeth penetrate to a greater depth than any other type of harrow teeth, sweeping the field clean of weeds and making fine, productive seed beds.

It does not clog. Weeds and trash work out through openings between frame. As many sections as desired can be used together. Horse-hitch or tractor-hitch. Teeth are clipped to frame—no bolt holes to weaken them.

Give your crops a good start with this harrow. Write for descriptive literature. Address John Deere, Moline, Ill., and ask for Folder ON-536

Why I Do Not Want My Son to Be a Farmer

OWNS FARM AND ACHING BONES

I DO not want my children to be farmers. Every one is organized except the farmer. The result is if a farmer wants to buy he says, what is your price; if he sells, he says, what do you pay. So he is the goat at both ends, and, therefore, all he has to do is work sixteen to twenty hours a day to over-produce and sell at low prices.

When he reaches the age of forty he is a worn-out wreck, while the people that choose other vocations are in the prime of their lives at forty. I mean farmers who started with nothing but debts as I did at the age of twenty-two. Today I am thirty-six and own a farm and some aching bones.

There's a Scarcity of Doctors

Medical doctors are scarce in the country and hard to get. When an accident occurs, or an epidemic, there is much unnecessary suffering until the doctor arrives.

However, I do not choose occupations for my children. I do not want to be blamed if they do not succeed in life. When the government lets the farmers alone, and doesn't encourage them to grow two blades where one grew before, then farming will be better. If the farmers would organize to put system in marketing and not glut the market, then I would say to my children, stay on the farm and enjoy short working days and prosperity.

But I shall not say that at the present rate the other people are coining money, without any risk of having their wages taken by hailstorms, cyclones, droughts, too wet weather, insects, blight, milk fever, azoturia, etc., which we have to fear always.—John W. Baush, Lehigh County, Pa.

THE WORK IS TOO HARD

I DO not wish my boy to be a farmer because he can make more money elsewhere and not work so hard and can have some time for pleasure with it.

There is no pleasure in getting up at four o'clock in the morning and working until eight and nine at night. I have never seen a successful farmer who did not do it and I have lived on a farm for thirty-seven years and have reared a family, three of them boys. I am happy to say they are doing well as mechanics and a clerk, altho I am not sorry they have had the experience of the farm as it gives them knowledge they could not get in the city and helps them to understand the farmer's problems which are so important at the present time.—Mrs. W. W. Acker, Perry County, Pa.

THE REWARDS ARE UNCERTAIN

I AM a backwoods, hill farmer, nine miles from the nearest railroad, doctor or moving picture house. It has been utterly impossible for twenty-four hours at a time in the past to obtain the services of a doctor.

I do not want my boy to suffer by seeing some loved one lost because he was powerless to obtain needed aid in time.

I want him to live and have employment where he will be well taken care of in sickness or accident, and his family also, with the advantages of hospitals, compensations and, yes, also pensions, something a farmer never has had and I think never will.

I want him to be free from the worry of getting just compensation for the work he does. Almost any other job or position he might have will pay him a certain wage for a certain amount of labor, but on the farm no one ever knows for certain just what the harvest will be. Blight, rot, scab, hail, floods and wind, to say nothing about the manipulations of prices by those who never raised a grain of farm produce, a pound of veal, pork or lamb, or milked a cow, may make conditions such that at the end of the year he has simply been wasting his time, even tho he has strived to the best of his ability.

Some speak of the independence of the farmer, his health, social standing, long life, morals, etc. I think this is mostly bunk and I have spent nearly as many years in the city as on a farm.

The good workman is always in demand in the city, keeps his teeth, eyes and the rest of him in better condition, is better socially, with his churches, lodges, clubs and other recreational interests, lives a longer, happier life, usually is not so narrow and close, more free, liberal and I think more of a man than his country brother.—E. H. Brigham, Susquehanna County, Pa.

THIS TALK OF FARM RELIEF

IT IS not a question for the father to decide as to what his son shall be when farming is considered. I have no boys of my own but have a dependent boy who has his fancies of a vocation the same as the rest of his companions. I would like to bring out this point as I see it in our own district.

Between thirty-five and forty years ago a graded course of study was instituted in our district schools, the high school children going to a neighboring town. In this period of thirty-five years there has been only one boy who was graduated from high school and came back and took up the occupation of his parent, whether farming or in other business or trades. I do not believe that my home district is different from any other rural district in regards to high school education and its effects on the boys of that district.

The High School Problem

The boro high school is a means of drafting from our rural districts the best and leaving behind to be farmers the indifferent, those lacking energy and the inebriate.

Now, if I had a boy I would not want him to be a farmer and have him classed with this indifferent class of children. I think that is one of the chief reasons why the farmers of today don't want their boys to be farmers. They want them to follow the procession and it is talked over in the home and elsewhere and the boy gets the idea he is being fitted for something more promising than farming.

Again, if I had early planned for my boys to be farmers, I surely would change my mind at this time when we see so much written about legislation calling for farm relief—helping to establish a market for the surplus and provide credit for the over-taxed and underpaid farmer.—H. D. Rees, Chester County, Pa.

"SHOULD" AND "WOULD" AREN'T SAME!

(Continued from page 3)

and the other $500 would go for a trip or two.

Perhaps I would go to the Pacific Coast and depend upon getting another thousand to bring me home some day. If I did not get the thousand until June or July, I should probably go to the seashore and stay until my money was exhausted.

You see, I have been very frank, feeling it was frankness you wanted, and not a sermon. But if it was really a sermon you wanted preached, you might use my letter as the horrible example of extravagance.—E. C. H., Lycoming County, Pa.

Why I Want My Son to Be a Farmer

A BUSINESS MAN'S IDEAS

I WANT three sons to be farmers. After about thirty-five years' experience in business in New York and Philadelphia, and keeping in close touch with farm life; also after a few years on a farm, my observations as to the opportunities for our boys may be helpful to the average country boy or his parents to make a better decision.

There are plenty of opportunities at the top in the business world, but too few properly equipped to fill them. The average country boy must compete with thousands of college-bred boys and with other thousands who have political, social and other connections, or "pull." This competition must be considered. The high living expenses and surplus for saving must also be considered. Where will he be ten years hence?

Can Be Successful While Young

On the other hand, a boy on a farm, with a little help and encouragement, can begin at ten years to accumulate a flock of poultry or a herd of purebred cows. He would soon be supporting himself and saving money. His self-respect, assurance and confidence would develop as his stock grew in value. He would have more assets and a better income at twenty-one than the average city boy of the same age. I think it would not be necessary to urge him to be a farmer nor to regret that he was one.

There are opportunities in the city for a country boy, but I think he has a better chance to succeed as a farmer than he would as a clerk or salesman or merchant, and not risk a serious disappointment when too late.

He can succeed with good poultry and purebred cattle and by following all the information now attainable from our agricultural departments. He would also be at home and independent. — Franklin Vreeland, Montgomery County, Pa.

THE PLACE TO SAVE MONEY

I WANT my son to be a farmer because I believe the farm is the healthiest place in the world. I have four sons and four daughters, two daughters and four sons at home. Two daughters married farmers and they are doing fine and love the farm. We all enjoy farming.

A young man who gets a good job on a farm can save his wages more easily than if he worked in the city, where there are so many temptations to spend it. When he has enough saved to get a good start, he can invest his money in a team and implements and become a tenant on a good farm. He can ultimately become the owner of a good farm of his own. A farmer is better off at the age of fifty than one who stays in the city.

Very few men remain farm laborers, on wages. Most of them become their own masters in time. Chances are best on the farm.—Mrs. A. J. Daniels, Wayne County, Pa.

A Far-Away Reader

LITERALLY thousands of letters are received by Pennsylvania Farmer each month from readers. Most of these letters come from subscribers living in Pennsylvania, New Jersey, southern New York, Delaware and Maryland. But occasionally the editors find in the morning's mail a letter with a strange stamp and a postmark that indicates that all the readers are not Americans. The answer to one such letter was sent recently to an inquiring reader at this address:

zap spol sobm ruo w. Truavo,
Filaika w. Poprade,
Tchechoslovaquie, Europe.

TNT let loose—fury unleashed. Lightning shot through a tube. Thunder concentrated in one tumultuous moment. The mass of steel trembles and recoils with a terrific lunge. The gun struggles to tear itself from its foundations—to fling itself into space. . . . Concrete lives through that supreme moment of stress.

Engineers know that Pennsylvania Portland Cement will stand powerful stresses. Whether cement is used for a heavily travelled state highway or a small fence-post, each bag must be perfect. The famous Pennsylvania Pre-test insures the reliability of every bag leaving our plant.

There is a building supply dealer near you who will deliver Pennsylvania Cement whenever and wherever you need it.

Pennsylvania Portland Cement is made only by the Pennsylvania Cement Company, which has offices in New York, Boston, Philadelphia and Buffalo.

Doctor Lipman's Weekly Talk on Soil Fertility Problems

Use of Manure on Corn, and Other Things

At the request of an Erie County, Pa., reader, the following suggestions are given as to the use of manure on corn, alfalfa and clover, and fertilizer mixtures for potatoes and buckwheat.

The practice of using manure reinforced with acid phosphate for corn has been shown to be a sound one by progressive farmers as well as by our experiment stations. Some farmers reinforce the manure with acid phosphate, spread it on the sod and plow it in the fall or spring preparatory to planting the corn. Other farmers prefer to spread the manure on the plowed land. This is carefully worked into the top soil and the acid phosphate either broadcasted or drilled with the seed. The exact procedure is, naturally, influenced by the labor resources of the farm, the area of land to be covered and by the topography.

It is well known that where even a small quantity of fine manure together with fertilizer is mixed with the top soil the corn crop gets a better start and makes a better growth early in the season. Whatever the exact procedure, you could get better returns from the manure when used on the corn than when it is applied on the new seeding of clover and alfalfa. These crops are not benefited to the same extent as is corn by the ammonia in the manure, neither can they utilize the plant food ingredients in manure as effectively as is done by a tilled crop like corn.

Now and then the top dressing of clover and alfalfa with manure in the fall is advisable. This applies particularly in the case of hillsides inclined to be leachy and limited as to water-holding capacity of the soil.

Corn is not sensitive to soil acidity and does not show benefit from applications of lime to the extent that clover or alfalfa does. However, we find now and then that the use of lime on corn land gives us a better crop. This is due to the lime stimulating the growth of bacteria and encouraging a more rapid decomposition of the vegetable matter in the soil, thus releasing more nitrogen for the corn crop. Under normal conditions, an application of manure or of a fertilizer containing readily-available nitrogen would be more effective for the purpose than an application of lime.

In most potato-growing sections, fertilizer mixtures containing five per cent of ammonia, eight per cent of available phosphoric acid and five per cent of potash are used with good results. Where potatoes are grown in rotation with other crops and where medium or good crops are produced, the applications of such materials are usually at the rate of 1000 to 1500 pounds per acre. Under intensive practice, the applications are more often at the rate of 1800 to 2000 pounds per acre.

Buckwheat is a crop that is often grown on land responding to applications of available phosphorus. At the same time, the use of some readily available source of nitrogen is also worth while. If acid phosphate alone is used, the applications would be at the rate of 250 to 300 pounds per acre. Where a mixed fertilizer is employed, it would be desirable to apply 300 to 400 pounds per acre of a material containing four to five per cent of ammonia, eight to twelve per cent of available phosphoric acid and three to four per cent of potash.—J. G. Lipman.

Length of Time It's Effective

How long may nitrate of soda or sulphate of ammonia be depended upon to supply nitrogen? Applied at rate of 200 to 300 pounds per acre, about May 15, on a crop spring planted and well out of the ground, would the loss from leaching or other causes up to August 15 be very considerable? With a labor cost of fifty cents per acre for each application, would it be a more economical plan to make two applications where such large amounts are used? Would tankage, applied at the same date, be completely used up by the crop by August 15th?—H. C., Monmouth County, N. J.

Application of nitrate of soda and sulphate of ammonia, made in the spring, usually continue to exert an effect until well toward the end of the summer. The results obtained will be influenced, of course, by the amounts of these fertilizers employed. The larger the amount used, the greater the length of time during the growing season when the effects may be observed.

Under unusual conditions of soil and season the length of time during which these fertilizers will stimulate plant growth will be shortened. However, it will require unusually heavy rainfall to wash out applications of 200 or 300 pounds of nitrate of soda per acre to such an extent as to prevent an increased supply of nitrogen to the crop early in the growing season.

Applied as suggested, nitrate of soda or sulphate of ammonia should continue to supply nitrogen up to the middle of August. Of course, this will be influenced by the size of the crop. A very large crop will use up the nitrogen contained in this application in a much shorter time than a smaller crop.

Remembering in this connection that not all of the nitrogen applied in nitrate of soda or sulphate of ammonia can be taken up by the crop (usually not more than two-thirds of it), we see at once that the larger the growth and the more vigorous the crop, the sooner will the available nitrogen applied be used up. The younger plants use less of it, but, as they grow larger, they use more and more of the nitrogen.

What Experiments Have Shown

Experiments of the New Jersey and other stations have shown that, when nitrate of soda is used at the rate of 200 pounds per acre, a single application is more economical. On the other hand, when as much as 300 to 400 pounds of nitrate of soda per acre is used, it might be more effective to apply half of it at planting time and the other half about two or three weeks later.

Tankage has at least a slight residual effect. Hence, when applied in the spring it is utilized less effectively than equivalent quantities of nitrate of soda or sulphate of ammonia. On the other hand, the nitrogen in tankage will continue to be available thru a longer period of time and some of it will be used up by the crop as late as the middle of August or even later. This residual effect will, naturally, be relatively slight when applications of tankage are at the rate of only 300 to 400 pounds per acre.—J. G. Lipman.

Better Homes Conference Held

Discuss Kind of Homes Farmers Really Want

SPONSORED by the Farm Structures Division of the American Society of Agricultural Engineers, a National Better Homes Conference was called in Chicago, February 18 and 19 at the Hotel Sherman.

The subject of improved farm homes has been discussed by all of the various farm agencies for years, but not until this conference has any concerted effort been made to nationalize the movement.

Professor Deane G. Carter, head of the Department of Agricultural Engineering at the University of Arkansas and Chairman of the Farm Structures Division of that society, was chairman of the conference.

A number of intensely interesting addresses were given during the first day of the conference. F. A. Wirt, president of the American Society of Agricultural Engineers, brought out the fact that farm structures constitute one of the most important branches of the science of agricultural engineering and showed that the farm home is the most important structure on the farm. Since farming is clearly a business, and the biggest business in America today, it should also be remembered that farming is a method of living, and as such, the farm home is the starting point.

Mr. Wirt stressed the importance of farm buildings economically. They represent nearly fifteen per cent of the investment in our American farms. He pointed out that the cost of producing a crop of corn in Lancaster County, Pennsylvania, was $39.75. Power and labor represented $25.01, or sixty-five per cent of the total. Rent on the land was $6.69. In Iowa, the figures were vastly different. The use of the land constituted fifty per cent of the cost of raising a crop of corn.

Iowa's Merry-go-round

The effort in Iowa has been to buy more land to raise more corn to feed more hogs, to get more money, to buy more land. This acquisition of more and more land on the part of Iowa farmers has run the price of land up to a very high price. The point is that if the farmers of Iowa had invested their surplus funds in farm home conveniences and equipment to make living on the farm easier, more pleasant and enjoyable, they would now be several hundred per cent better off than they have been during the past few years. Had the Iowa bankers suggested the purchase of such conveniences they could have prevented the mad scramble for land which has raised land prices to such a point that it cannot by any system of agriculture pay dividends to the owners.

William Draper Brinkloe, a farm architect, who has devoted a great deal of time and study to farm house architecture, presented a paper which outlined an analysis of farm home needs as presented by farm folks themselves. For some years Mr. Brinkloe, a contributor to Pennsylvania Farmer, has been trying to learn just what sort of homes farm men and women want—not what kind a city man thinks they want.

He has found that nearly half of the thousands of farm folks he has consulted prefer one-story bungalows. Houses with six rooms are most popular. Nearly 100 per cent want bath rooms and they want them on the first floor. About one-half want houses of frame construction. Hardwood floors are popular with forty per cent of the farm folks. Fifty per cent want fireplaces, but also specify hot air or steam heating plants. A great many want offices, sewing rooms, sleeping porches, breakfast nooks and other up-to-date extras which are found in modern homes in the cities.

One interesting feature is the desire on the part of a large number of farm women for a washroom or laundry on the first floor. One woman wrote, "I never start washing in the basement that the telephone does not ring or else I must go upstairs for something or other, and I want my washroom on the first floor. Climbing steps is hard work."

There are two major problems confronting farm folks in so far as better farm homes are concerned. The one problem has to do entirely with the planning and building of a new farm home while the other has to do with the remodeling of farm homes already built. These problems were discussed at considerable length during the conference and various committees and cooperating agencies were enlisted to make special studies of such problems.

Numerous Resolutions Passed

A number of resolutions were passed, the most important of which was a request that Secretary Hoover be asked to call a conference or congress to discuss the elimination of waste in America. Inasmuch as the annual fire losses in America totaled more than 549 millions of dollars in 1925 and more than fifty millions represented farm fire losses, it was deemed advisable that this farm loss be given due consideration. Fire underwriters are of the opinion that insurance rates can be materially reduced in the rural districts if proper steps are taken to make farm structures more firesafe.

There will be more of these conferences in the future. The movement will not stop here, but what is really needed is greater backing by farmers. This conference lacked that element which goes to make up any successful conference that has a problem in agriculture to deal with: there were so few actual farm folks present. It was moved, heartily seconded and the motion loudly carried, that future conferences of this kind include the greatest possible number of real farmers and their representatives.

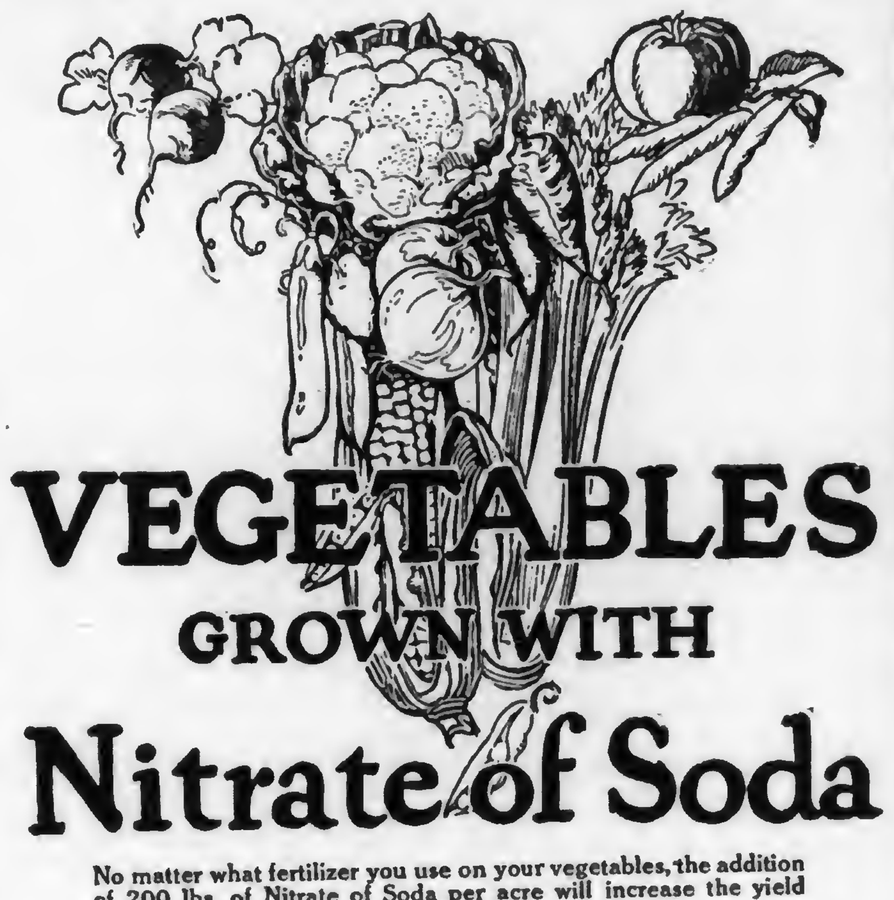
The commercial industries which have farm home improvement really at heart should also be included at such conferences. These folks can so often add a touch to such meetings, solving certain problems with which they have been in contact for years. It is lamentable that so few of the manufacturers of water systems, farm electric plants, heating plants and other household utilities were present at this meeting.—Frank A. Meckel.

Storage Holdings

STOCKS of eggs in cold storage February 1 are reported by the Department of Agriculture at 574,000 cases compared with 81,000 cases on the same date a year ago, and 203,000 cases, the five-year average.

Holdings of creamery butter are reported at 39,389,000 pounds compared with 45,748,000 pounds last year; total stocks of frozen poultry at 108,406,000 pounds compared with 138,189,000 pounds a year ago, and total stocks of meat in storage at 694,340,000 pounds compared with 1,019,995,000 pounds on February 1, 1925.

The department reports an increase in cold storage holdings of apples, being 3,157,000 barrels compared with 2,498,000 barrels a year ago; 9,859,000 boxes compared with 7,264,000 boxes, and 1,674,000 bushel baskets compared with 940,000.



VEGETABLES
GROWN WITH
Nitrate of Soda

No matter what fertilizer you use on your vegetables, the addition of 200 lbs. of Nitrate of Soda per acre will increase the yield enough to make a big profit on the Nitrate used.

Careful experiments conducted by agricultural authorities in several parts of the country have shown conclusively that the following average increased yields per acre can be obtained from an application of 100 lbs. to 200 lbs. of Nitrate of Soda:

Asparagus	100 bunches
Beans (White)	225 lbs.
Beets	4000 lbs. tubers
Cabbages	6100 lbs.
Carrots	7800 lbs.
Celery	30%
Mangels	123.7 bushels
Onions	1800 lbs.
Potatoes	3600 lbs.
Sugar Beets	1330 lbs.
Sweet Potatoes	3900 lbs.
Tomatoes	100 baskets

Our free bulletins contain valuable information which has helped thousands of farmers to grow bigger and better crops. They tell how and when to apply Nitrate of Soda for best results. A postal to our nearest office will bring them to you. Name crops in which you are most interested and for our information mention the number 2322

USE
"AGRICO"
FERTILIZERS
For All Crops

"AGRICO" Fertilizers contain all the elements of plant food which have long been regarded as essential to the fertilization of growing crops, as well as other elements which have not been so generally recognized. They may be fairly called the "Premier Fertilizers" of the age.

Manufactured Only By
THE AMERICAN AGRICULTURAL CHEMICAL COMPANY
Executive Offices: 2 Rector St., New York

Bad light costs more than good

YOU pay for poor light in the extra hours of labor in the early morning and evening. You pay in the added weariness of your wife when her kitchen workshop is poorly lighted. You pay in the ruined eyes of your children. The least of these is more expensive than Colt Light.

Colt Light costs comparatively little to install and little to operate. With it, you can light not only your house, but the barn and poultry buildings.

And the Colt Hot Plate is always ready for immediate use for breakfast or an emergency when the kitchen range is out.

The Colt Light Plant has nothing to wear out. It has no expensive parts to replace.

The cost of Colt Light can be financed to spread over a long period of months if you own your own farm. And it practically pays for itself by the hours of labor it saves every day. With a large 200-lb. capacity Colt Light Plant, the average user need replace the Union Carbide but an average of two or three times a year. Union Carbide is quickly available at factory prices from one of 175 warehouses. Investigate Colt Light. Write today for our booklet, "Safest and Best by Test."

No other proposition offers as great an opportunity for the farm-trained man as selling the Colt Light Plant. Write our nearest office for full particulars.

RADIO DEPARTMENT

Conducted by
BRAINARD FOOTE

Objects Near Aerial often Weaken Radio Waves

THE simple statement that a wave from a broadcasting station causes electric current to flow in your aerial may cause you to wonder whether that same wave cannot make current flow in other things besides aerials, telephone wires, electric lines, steel buildings, bridges, iron fences and so forth. The fact is that radio waves do start electric currents in these objects.

You may pick up your portable radio set and attach it to the bedspring, for instance, the framework of an automobile, the wiring for your doorbell and to countless other metal structures and receive broadcasting successfully. It follows, therefore, that the radio wave is weakened in the immediate vicinity of any of these objects, just as a wave on the ocean is decreased in size or smoothed out by the effort required for it to rock a steamship. It takes some of the power out of a radio wave to make current flow in the steel beams of buildings, street wires, etc.

In the case of the ocean wave, the portions of the wave that do not strike the vessel go along with undiminished strength and the gap made in the wave by the steamer is soon bridged across and a full-strength wave formed again. So with the radio wave. As the wave goes by these absorbing objects, the weakened sections are replenished from either side and the radio wave speeds past with practically all its former power.

Aerial Locations

You should try on this account to erect your aerial in such a position that it will not intercept waves already weakened by encounters with other nearby objects. Of course, it isn't always feasible to do this, but you are in a better position to put up your aerial and get successful reception from it if you know something about the losses in wave strength that certain other things will cause.

It may help you if you try to visualize the radio wave as it circles out like the proverbial ripple in the pond of water, started by the well-known pebble that the boy dropped in. If the pond is smooth as glass the little ripples will spread out neatly and lap the shores But, if the pond is full of water-lilies, cat-tails and weeds the ripples will soon cease, their energy spent in moving these interfering objects.

The radio wave is like this. It travels far over the surface of an ocean because there are no objects sticking up to interfere with its progress, but over land there are hills, trees and works of man to impede the passage of radio impulses.

Important Factors in Erection

The two most important items in the erection of an aerial are, first, height and second, proximity to other objects. Aside from interfering objects, the best radio aerial has a maximum of height in proportion to the amount of wire used in it. Keep in mind the fact that a wire straight up and down is best from this standpoint. If you could have a nice big sausage balloon anchored right over your home, with a 150 or 200-foot wire running straight up to it you could hear Los Angeles on a loud speaker with only two tubes!

Perhaps you might like to try some such experiment. When the wind's strong, run up a good-sized box or tailless kite, sending up 200 feet of twine first and then 200 feet of light aerial wire. Just observe the terrific volume with which the stations pound in. Don't try it in a thunderstorm, tho, for you might repeat the famous experiment of Ben Franklin with more disastrous results!

Your aerial should be high rather than long and a total length of 100 feet should be plenty if the aerial is at least three stories from the ground, with no roofs or buildings much higher nearby. This length includes the lead-in.

Country Reception Best

In the country the possibilities for unimpeded reception are best. Reception is always fine in flat country and good in hilly country where one is located on top or near the top of a hill. At the bottom of a small sharp valley conditions are usually relatively poor and the aerial has to be quite high to equal results obtainable on higher ground.

You can easily conceive of the radio wave hurtling over the landscape as a car riding swiftly over a rough road. The tires hit the high spots and dip into some of the depressions where they are wide and shallow. Hills partly absorb and partly reflect the waves. Trees are bad absorbers particularly in summer when their sap is running. An aerial should never be closer than twenty-five feet to a tree in any direction and, if possible, the aerial ought to be higher than the topmost leaves.

It is not hard to lash a pole to the upper limbs so that the supporting wire is elevated five to fifteen feet above it. A pulley and weight will take up any play caused by the movements of the tree in the wind. Never allow the aerial or lead-in wires to run closer than five feet to a gutter-pipe or any other wires whatever. In fact, if you place your aerial to have the greatest average height from the ground and at the same time to be as far away from all other objects such as trees, houses, barns, wires, etc., you'll get results.

Difficult to Keep City Aerials Clear

City locations are more trying. It is harder to keep the aerial clear of building walls, especially when the theory is offset by rigid rules by the apartment house superintendent that the wires must be cleated close to the wall. If most of the stations you wish to get lie to the west, try to run your aerial in that direction if you cannot place it higher than the building. If it is higher than the roof, follow the usual rule and run the aerial directly away from the west, so that the lead-in end of the aerial points west.

Never run wires parallel to other aerials or wires. Run them at right angles, even if this means placing your aerial in a direction different from that of the desired stations. It is proper to cross another aerial at right angles, however. Avoid steel signs, railings, gutters, pipes, etc. Simply follow, to your best ability, the two most important rules:

1. Make the aerial higher than other nearby objects.
2. Space the aerial and lead-in as far as possible from them.

Now, if you care only for local reception, you may violate these rules

This Canine Vagrancy

Too Many Dogs Can't Be Found "to Hum"

WE WONDER when we receive a new dog license tag why each of the over-a-thousand dogs in the county is kept sheltered, boarded and has its tax paid.

There is real need on every stock-farm of an intelligent, well-trained dog, and it seems the inalienable right of a small boy to own a puppy. I heard one of our most popular American orators trying to describe a feeling of great joy he had experienced and he said, "I was never so happy but once before, that was when my father dropped in my arms a white puppy."

But there are many worthless mongrel dogs seemingly doing nothing but consuming food and getting into mischief. There is a curfew law for dogs, but all owners do not comply with it, for dogs are often seen prowling around after nightfall. Before long someone's sheep are killed or injured.

When Sheep Are Raided

One who has seen the havoc wrought in a raid on a flock of sheep will always remember it and resent the carelessness which, in the majority of cases, made it possible.

The dogs do not kill for food. They kill for sport, chasing the sheep until it is cornered or exhausted, then sharply clipping an artery in the neck, or tearing the flesh until the sheep ceases to struggle when it is abandoned for the excitement of killing more. Mother sheep are sometimes killed in a back pasture and the lambs starve or wander away and are lost. A close watch should be kept when lambs are young for a ewe will not desert her young.

There are several reasons why dogs become sheep-killers. Homeless curs lure dogs from home and teach them evil ways. Sometimes the sheep killing seems a hereditary trait. A dog resembling a well-bred Collie was owned by our neighbor. It was shot while feeding on a slain sheep. All of her pups, living miles distant from each other, developed sheep-killing habits.

As an old fashioned man used to say of women; a dog's place is "to hum." Good sleeping quarters, plenty of suitable food, kindness and a job will make of a worth while dog, a reliable farm hand, a trusty protector, a pet for children and an affectionate friend. If not, he may some day become an expert sheep killer.—M. C. S.

Radio Waves Weakened

(Continued from preceding page)

as much as you please, providing your set is fairly sensitive. You can receive via indoor wires, the phone line and so forth. If you live on the fourth floor or higher, you may drop a wire out of the window and get pretty fair reception. Indeed, local reception is often freer from static and electrical noises when you do use an indoor aerial.

But, should you desire out-of-town entertainment to any extent and want cross-country reception for its thrills and novelty, the suggestions given above may assist you in intercepting the maximum amount of radio wave energy with your aerial. After all, a radio aerial is a mighty small affair in comparison with the vast areas covered by the transmission from a broadcasting station and the fact that a single-tube set can pick up and amplify to audible volume faint impulses from a couple of thousand miles' distance is surely one of the wonders of our modern world.—B. F.

Lighting Up Mercer County

MERCER COUNTY is electrifying its farms these days thru the combined efforts of the farmers who already are supplied with electric current and the public utilities serving them.

The Mercer County Light, Heat and Power Company has inaugurated a county-wide campaign advertising electricity to the farmers. Large billboards are decorating the roadsides in all parts of the county bringing home to residents of every community the value of good lighting in their homes and the advantages of having adequate power in a safe form on their farms.

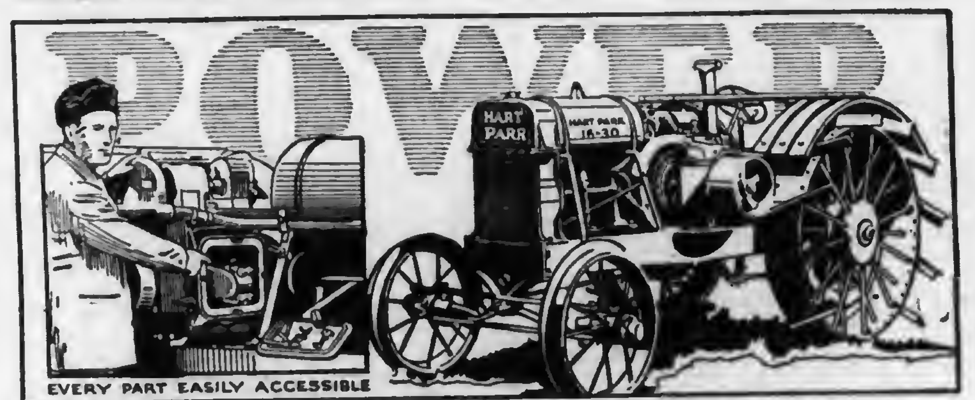
These signs are located along the roads where the power company runs its lines and are illuminated at night by means of three large electric lamps with shades throwing the light back upon the signs.

The electrical equipment concerns have caught up with demands which have been placed upon them in the past by industrial development in this county and they realize that the next big field of endeavor is the agricultural field. Farmers have been neglected electrically just about long enough and now the pendulum is swinging their way.

Papers Are Helping the Cause

This series of billboard advertisements in Mercer County is but a small portion of the advertising that is being carried out to farm folks in this country. Farm newspapers and daily papers are carrying the message to millions of farmers every year and the folks on the farm are now demanding electrical service and getting it. We are glad to note, however, that this Pennsylvania county is one of the most progressive in the United States in carrying its own message to its own people.—F. A. M.

1901 TWENTY-FIFTH ANNIVERSARY *A Quarter Century of Service to Farmers* 1926



"My Hart-Parr runs a 36-inch cylinder thresher with self-feeder and blower attachments; cuts ensilage with a 20-inch Ohio cutter with blower. Last year it hauled 3000 feet of green lumber in one load."
Arthur T. Mikesell, Centerville, Pennsylvania

HART-PARR
ACCESSIBILITY
means much to you in convenience

One of the reasons why the oldest working tractors in existence are Hart-Parrs is because of their unusual accessibility. Compare a Hart-Parr in this respect with any competing tractor. You can get to the main bearings of a Hart-Parr in only four minutes; the rocker arms and bushings in three minutes; the governor in three minutes; the shifting gears in four minutes. You can adjust the clutch in one minute and grease the entire tractor in only fourteen minutes. And the Hart-Parr delivers more horse-power per dollar than any tractor on the market; paying for itself quickly in money saved in time, labor and lower production costs.

Swiss Weather Prophet

The Swiss Weather Prophet is made of hardwood. The house is decorated in front with a stag's head, a bird, glass windows and a thermometer between the doors. On the green covered roof is a starling's cage. The inner background is decorated with views of Switzerland. There are two doorways. When the carved figures of the two children come out, look for fair weather; when the little old witch comes out, rain or snow with stormy weather is sure to come.

This instrument is made on scientific principles. The figures which prophesy the weather are suspended on a platform, with a piece of catgut. This catgut is sensitive to the least change of atmosphere and is so adjusted that the figure of the witch comes out in advance of rain and the figures of Hansel and Gretel for fine weather. This Weather House will be sent prepaid for two yearly subscriptions at $1.00 each or with your own renewal and 50 cents extra. Reward No. 126.

Michigan and New York fleeces—Delaine unwashed, 48c; ½-blood combing, 49@50c; ⅜-blood combing, 51c; ¼-blood combing, 51c; fine unwashed, 45@46c. Wisconsin, Missouri and average New York—½-blood, 46@47c; ⅜-blood, 48c; ¼-blood, 47@48c.

GRASS SEED—WHOLESALE PRICES

Toledo, Ohio, February 27, 1926.

Cloverseed, cash, imported, $14.85; domestic, $21; February and March, $14.85; October, $15.90. Alsike, cash and March, $17. Timothyseed, cash, February and March, $3.45; September, $3.75.

FEED PRICES

The prices below are for prompt shipments based on payment on arrival of cars as quoted by the Philadelphia jobbing trade to retail feed dealers on Monday, March 1. Quotations cover solid carlots for delivery at Philadelphia or Scranton rate points.

Pure spring bran	$32.50@33.00
Spring bran	32.00@32.50
Soft winter wheat bran	32.50@33.00
Standard middlings	32.00
Soft winter wheat middlings	32.20@37.00
Flour middlings	33.60@36.50
Red dog flour	38.50@41.00
White hominy	30.50@32.20
Yellow hominy	30.00
Gluten feed	40.70@43.00
36 per cent cottonseed meal..	37.50
41 per cent cottonseed meal..	39.50@40.00
43 per cent cottonseed meal..	41.50@41.75
34 per cent linseed meal.....	48.20@48.75

Mill feed easy with production ample for requirements.

For Baltimore, Cumberland and Williamsport rate points, subtract 20c per ton (for cottonseed meal 40c per ton); for New York, Newark rate points, add 40c per ton (for cottonseed meal 60c per ton); for Woodbury, Bridgeton rate points, add $1.00 per ton; for Freehold, Toms River, Cape May rate points, add $1.40 per ton.

Feed Market Situation

THE feed market has developed further weakness during the week ending February 25 with prospects that prices may continue their downward trend unless weather again becomes severe and spring is unusually delayed. Mills have not been pressing wheat feeds on the market but offerings have been sufficient to cause a weak undertone to the mill feed market. Resellers in some markets are offering both bran and middlings below the prices quoted by the mills. Stocks of wheat feeds are only moderate but the demand continues of very small volume as farmers continue to use large quantities of the cheap grains of which they have a large supply in most sections. Middlings and other heavy wheat feeds are relatively cheaper than bran, altho it is expected that the demand for these feeds will show some improvement.

The linseed meal market has also became weaker altho prices have been holding fairly steady in the West. The undertone is weak, however, because crushers are getting caught up on their orders.

Stocks of Cottonseed Meal Increase

The stocks of cottonseed meal on February 1 were about 120,000 tons larger than on February 1 last year and the export demand has shown no improvement. The domestic demand also continues of small volume and prices remain relatively low. A large percentage of the meal is not grading prime this year because of the dark color, but mixers have taken considerable of the dark colored meal at discounts of $4@5 per ton under the prices of prime meal.

The prices of the corn feeds were reduced $1@2 per ton during the past week in an effort by the manufacturers to prevent stocks accumulating at the mills. The production of both gluten and hominy feed continues large and while the lower prices have slightly increased the demand for this feed the market tone continues weak with the possibility that prices may be further reduced to stimulate sufficient demand to consume the current production.

The market for alfalfa meal also continues dull but it is reported that a number of the western mills have discontinued operations and are now selling meal from store. Prices have held fairly steady during the past few days.—U. S. Bureau of Agricultural Economics.

County News and Comment

Bedford County, Pa.—Good old fashioned winter weather thruout the last few weeks. Roads were closed but the principal ones are now open. The grain did not look good in the fall but it has had a good covering during the cold spell. Farmers hauling some manure and tending stock and lending a hand to keep the roads opened. Cattle looking fairly good. Good cows bringing $100 to $125. Beef cattle slow; dressed beef, 12@14c lb.; calves, 14c; four per cent milk, $2.90 cwt.; butter, 45c; eggs, 40c. wheat is shipped from local station at $1.75. Corn in small lots at $1; oats, 50c; potatoes, $2.50; apples, $1.—J. O. A., Feb. 13.

Blair County, Pa.—Some big snows lately. State and county made a great effort to keep roads open but many township roads still in bad condition. Some dissatisfaction over the tuberculin testing of cattle is being voiced by stockmen in some sections of the county. A great deal of wheat was sold during the early part of the month when the price reached $1.80 bu. Prices for most farm produce better now than a month ago. Local dealers now paying $1.65 a bu. for wheat, 80c for corn, 45 for oats, $25 for hay, $15 for straw; butter, 50c; eggs vary from 40c to 60c dozen.—H. E. H., Feb. 23.

Bucks County, Pa.—Nice weather in January. February making up for lost time. There was a blizzard February 3. Roads were closed. Before roads were all opened another blizzard worse than the first blocked about all the public roads running east and west that are still almost impassable. Wood in great demand, bringing $7 per two-horse load. Eggs, 40c; butter on an average of about 60c; potatoes, $3.20; shelled corn, $1.10; rye, $1; oats, 64c; wheat, $1.70; timothy hay, $12@16; cut hay, $10@12; straw, $10. Medium white ash and chestnut coal 70c; white ash, pea coal, 55c; lard, 22c; dressed hogs, $19; bulls, $4.50@6; steers, $7@10; calves, $13@14; dressed chickens, 30@34c; granulated sugar, 6c; milk, 12c qt.—E. W. T., Feb. 22.

Cameron County, Pa.—Have been having a stiff winter here for last month. Have had three or four very heavy snow falls and zero weather. Early this morning warm wind began to blow and is taking the snow off fast. Work awfully scarce in the county, everything closing or laying off men. Not much sickness in county, but a number of broken bones and fractures from falling on icy pavements. Coal mines running pretty steady and paying well for both digging and hauling. Prices: butter, 50c; eggs, 40@45c. Best wheat flour at mill is $3 sack. corn meal, $1.90 cwt.; cracked corn, $2 cwt.; pure corn and oats, $9 cwt.; oats, $1 cwt.; straw, bale, $1.50; timothy hay, $1.35 cwt.—Q. E. T., Feb. 22.

Dauphin County, Pa.—Real winter during first half of February. Twenty inches of snow and severe storms caused much hindrance to traffic. Fields well protected by snow. Roads in bad condition. Rural mail carriers experiencing much difficulty in travel. Much inconvenience caused by coal strike. Not much farm work being done. Sales starting. Prices for products: wheat, $1.65 bu.; oats, 55c; corn, 85c; hay, $20; butter, 60c; eggs, 35c.—I. F. M., Feb. 20.

Erie County, Pa.—This is a progressive farm county, the report of the State Department of Agriculture shows that twenty-five per cent of the farm houses in this county are provided with heating systems, and eleven per cent have running water. This county stands second in the state for modern conveniences in farm homes. Traffic regulations in the city of Erie have played havoc with the street market. Accordingly an organization of market gardeners has been formed and better marketing conditions are now in prospect. Potato market in this county still very unsettled. On account of extremely high price, grocers bought very sparingly, waiting for lower prices. This has resulted in forcing down the price of spuds. Retail market: potatoes, $2.75; cabbage, 5c lb.; apples, Baldwins, 8c lb.; Greenings, 6c lb.; carrots, 5c lb.; turnips, 5c lb.; butter, 51c; lard, 19c; onions, 5c lb.—E. M. F., Feb. 24.

Fulton County, Pa.—A large snow fell on February 3 and a strong wind soon made roads impassable. Some sections received no mail for nearly a week. There is not much farm work going on at present. Pruning is well under way. Hens are laying fairly well thruout the county but eggs rather low in price. Very few farm sales listed as yet and not many farms will be vacant during the coming year. Market quotations: eggs, 26c; butter, 40c; veal calves, 13c; wheat, $1.75; oats, 55c; hay, $20.—T. H. T., Feb. 23.

Lawrence County, Pa.—Cold weather continues, a real old fashioned winter such as we have not experienced for several years. Early in month a deep snow fell, drifting on the roads running north and south until traffic was paralyzed so that neighbors had to help each other out in way of supplies. No mail for several days. A shovel brigade organized after drifting ceased soon cleared roads for travel. Many farmers wished for the old-bob-sled that had been allowed to go to decay for want of shelter. We long for a revival of the once popular "Farmers Institute" that we might get some new ideas, why this lethargy? Wheat flour and bread are climbing up in price. Clover hay is in demand at $18. Veal calves, 19c dressed; fresh country butter scarce and selling high; eggs not so plentiful as a month ago.—M. L. V., Feb. 22.

Snyder County, Pa.—Winter has shown first signs of a break within the week when a thaw caused considerable high water. Yesterday a fresh snow fell and this morning the thermometer registered zero. Snow birds are abundant. Wild game is being fed. State roads being cleared of snow every few days. Farm sales in full swing. Today a carload of Missouri horses are being sold at Middleburgh. Fat hogs have all passed into the market and several carloads from Pittsburgh have been brought in by local butchers. Farmers are selling wheat at $1.75; corn, 50c; oats, 45c; eggs, 40c. The coal strike is over and people are wondering what it was for. There is plenty of wood in this part of the state so little inconvenience was caused by the battle between miners and operators. W. Feb. 20.

Tioga County, N. Y.—Deep snows have closed country roads. Some schools have suspended until highways are cleared. Mail carriers have hard work delivering mail. Very cold weather by spells. Some farmers lost quantities of potatoes, not properly cared for, by freezing in their cellars. This was the first county in the state (and some say the first in the United States) to experiment with county nurses and the first rural community to have a complete community nursing service. The experiment has been watched with keenest interest by health authorities, physicians and social workers. Those in charge of dog quarantine in this county were called to Ithaca, Tompkins County, to confer with supervisors there regarding sheep-killing dogs which have been playing havoc in the county. They fully explained methods used in Tioga County to maintain the effective quarantine.—C. A. B., Feb. 19.

Prices and Prospects

THE potato market in the East was dull during the week ending February 24, while the western markets displayed a firmer tone. Shipment averaged around 600 cars a day as compared with 800 last February. Pennsylvania continues to supply the bulk of the potatoes on the Philadelphia market. Prices on fancy well graded stock have held up fairly well but there has been considerable poorer stock offered at lower prices. Round whites were selling at $6.65 to $6.85 per 150-pound sack in Philadelphia on Wednesday and at $6.25 to $6.50 in Pittsburgh.

The statement that Pennsylvania potatoes are of better quality than usual this year is borne out by the figures recently published by the Department of Agriculture. Reports from a large number of dealers show that about 76 per cent of the Pennsylvania commercial crop graded U. S. No. 1, compared with 68 per cent in 1924. The New York State crop was not of as high quality as the previous year with 65 per cent of U. S. No. 1's in 1925 and 71 per cent in 1924. Maine, on the other hand, produced better potatoes with 80 per cent grading U. S. No. 1 as against 75 per cent in 1924.

	1924	1925	1926
Alabama	12,500	8,940	9,200
Florida	28,000	21,920	19,500
Georgia	2,630	2,010	1,870
Louisiana	15,510	15,630	10,900
Mississippi	1,300	1,240	1,300
North Carolina ...	26,000	22,100	21,440
South Carolina ..	20,000	14,860	16,350
Texas	10,000	10,710	9,850
Virginia	100,520	86,100	76,630
	216,460	183,510	167,040

The first official estimate of early potato acreage shows 167,040 acres planted, or intended to be planted in nine early producing states, compared with 183,510 acres harvested in 1925. Alabama and South Carolina were the only states showing increases according to these figures.

The planting in the Hastings District of Florida did not begin this season until about the eighteenth of January and practically no planting had been done in the Lower Valley of Texas prior to this time. But 79 per cent of the acreage was report-

(Continued on page 38)

Tioga Feed Service—
Complete, Economical, Satisfactory

TIOGA Feed Service offers you every service with the exception of the actual delivery of the feed. This, because experience has shown us that the most economical and satisfactory method of feed distribution is through *local feed dealers* who deliver direct to you when and as you want it.

But, if you are in territory not served by our dealers, we will see that you are supplied with Tioga at the same price as the cost to the dealer, plus a charge not to exceed $1.50 a ton, handling charge, for the dealer who receives the shipment.

We have watched with selfish interest the results of the various experiments of the past few years, made by feeders, to buy direct from the manufacturer and eliminate the feed dealer. Our success is so much dependent on successful dairying that we are for anything that will help. But we are sure that so far, no plan of distribution other than through the dealer has proved satisfactory either as to economy in handling or for delivery to suit the buyers' convenience and needs.

When a better method is found we will use it. Meanwhile, our dealers are an efficient part of our service. Go to them for our feeds but come to us with your problems. We can help you solve them just as we are helping a number of feeders now.

Write or come and see us.

TIOGA MILL & ELEVATOR CO., Waverly, N.Y.

Use the TI-O-GA Dairy Feed which forms a balanced ration with your own roughage

TI-O-GA FEED SERVICE

PROFIT OR LOSS?

WHICH does your 1925 fruit crop show? If a loss, lack of thorough, timely spraying may be the reason. If a profit, no doubt efficient spraying is one big reason. Let us tell you about the easiest, fastest, most dependable, most durable sprayer to use for FRUIT PROFITS. Dealers in all important fruit sections. A card from you will bring our latest catalog G-25, by return mail.

Ice-Bound Hearts

(Continued on page 26)

seen a woman like you," he confided, "and it seems like heaven. You don't know how lonely I am!" His voice trembled. "I wish that Pelletier could see you—just for a moment," he added. "It would make him live again."

Something in the soft glow of her eyes urged other words to his lips.

"Mebby you don't know what it means not to see a white woman in—in—all this time," he went on. "You won't think that I've gone mad, will you—or that I'm saying or doing anything that's wrong? I'm trying to hold myself back, but I feel like shouting, I'm that glad. If Pelletier could see you—"

He reached suddenly in his pocket and drew out the precious packet of letters. "He's got a girl down south—just like you," he said. "These are from her. If I get 'em up in time, they'll bring him round. It's not medicine he wants. It's woman—just a sight of her, and sound of her, and a touch of her hand."

She reached across and took the letters. In the firelight he saw that her hand was trembling.

"Are they—married?" she asked.

"No, but they're goin' to be," he cried triumphantly. "She's the most beautiful thing in the world, next to—"

He paused, and she finished for him.

"Next to one other girl—who is yours."

"No, I wasn't going to say that. You won't think I mean wrong, will you, if I tell you? I was going to say next to—you. For you've come out of the blizzard—like an angel to give me new hope. I was sort of broke when you came. If you disappeared now, and I never saw you again, I'd go back and fight the rest of my time out, an' dream of pleasant things. Gawd—do you know—a man has to be put up here before he knows that life isn't the sun an' the moon an' the stars an' the air we breathe. It's woman—just woman."

HE WAS returning the letters to his pocket. The woman's voice was clear and gentle. To Billy it rose like sweetest music above the crackling of the fire and the murmuring of the wind in the sprucetops.

"Men like you—ought to have a woman to care for," she said. "He was like that."

"You mean—" His eyes sought the long, dark box.

"Yes—he was like that."

"I know how you feel," he said, and for a moment he did not look at her. "I've gone thru—a lot of it. Father an' mother and a sister. Mother was the last, and I wasn't much more than a kid—eighteen I guess—but it don't seem much more than yesterday. When you come up here, and you don't see the sun for months, nor a white face for a year or more, it brings up all those things pretty much as tho they happened only a little while ago."

"All of them are—dead?" she asked.

"All but one. She wrote to me for a long time and I thought she'd keep her word. Pelly—that's Pelletier—thinks we've just had a misunderstanding, and that she'll write again. I haven't told him that she turned me down to marry another fellow. I didn't want to make him think any unpleasant things about his own girl. You're apt to do that when you're almost dying of loneliness."

The woman's eyes were shining. She leaned a little toward him.

"You should be glad," she said. "If she turned you down—she wouldn't have been worthy of you—afterward. She wasn't a true woman. If she had been her love wouldn't have grown cold because you were away. It musn't spoil your faith, because that is—beautiful."

He had put a hand into his pocket again, and drew out now a thin package wrapped in buckskin. His face was like a boy's.

"It might have—if I hadn't met you," he said. "I'd like to let you know—some way—what you've done for me. You—and this."

Let Us Help You To Make Money in the SOUTH

Fine farms are available in every section shown in this map. Farms on which you can make more money and live better than in the thickly congested sections of the North and Northwest. A practically all-year growing season and plenty of labor.

Good schools, good roads and lower living expenses, because of saving in heating costs, all add to the charms of the South. You can make money here in every line of farming.

Write today asking for information as to how we can serve you. Our advice is free.

PENNSAYLVNIA FARMER 261 So. Third St., Phi'a. Pa.

(Continued from page 35)

ed planted in Florida on February 8 as against 96 per cent in 1925, and but 66 per cent on February 10 in Texas compared with 88 per cent in 1925. This would indicate that the movement of the crop will be as late as it was in 1924. Unofficial reports from North Carolina and Virginia state that some growers in those states have already planted small acreages of potatoes.

Light European demand and a sharp decline in the Argentine markets were the principal causes of the weaker tone in the wheat market during the week ending February 20th. Soft winter wheat was dull. The new crop is reported to be generally in good condition, but sections of the soft winter wheat belt in Ohio, Indiana and Illinois have suffered some winter killing. This is especially true in the late sown fields.

Corn Market Weak

The corn market was weak on account of larger offerings a large percentage of which are in rather poor condition due to high moisture content. Prices for good dry corn held fairly steady but damp corn sold at wide discounts. The oats market showed little change during the week. Rye declined with wheat and also because of a lack of export demand.

A rather draggy condition prevailed in the leading hay markets of the country during the week. Top grades were scarce but moved at barely steady prices, while receipts of ordinary hay were more than ample for the demand. Farmers in some sections were marketing more freely as the close of the feeding season was approaching. Timothy was generally dull. The New York market weakened under increased receipts and prices declined nearly $1.00 per ton. The Boston market was a little firmer, but the Pittsburgh and Cincinnati markets reported prices about fifty cents lower on account of light demand and liberal offerings of ordinary hay.—W. R. Whitacre.

Lancaster Tobacco

BUYING of the 1925 crop of Pennsylvania tobacco is still very sluggish, and little leaf is being moved. The purchase of the crop this year is slower and at lower average prices than has been the rule for a good many years.

Growers all over the county are emphatic in their statements of disapproval of the buyers' methods, and declare themselves unwilling to raise tobacco under present conditions.

Farmers in the northern end of the county in the vicinity of Manheim and Lititz met last week and decided to hold a meeting of all tobacco growers in the county at Lancaster on March 8 to consider a plan for handling the unsold leaf thru the government agencies of the Land Banks and Intermediate Credit Banks.

Large Amount of Crop Unsold

C. R. Titlow, of the Federal Land Bank, of Baltimore, will attend the meeting to explain the use of warehouse receipts and an agricultural credit corporation to dispose of the remainder of the 1925 crop. At least sixty per cent of the crop is unsold at the present time.

Tobacco experts agree that this year's tobacco is very fine in quality and that it should have a higher market value than it now has.

The United States House of Representatives last week voted favorably on a bill which will give Lancaster County $67,000 for tobacco investigation. It is hoped that with this money an investigation can be conducted into the growing methods in Lancaster County which will result in a finer grade of tobacco.—Garden Spot Farmer, Feb. 25.

Veterinary

Conducted by Dr. J. F. Shigley

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We invite readers to make use of this service. Clippings from the column when properly preserved and classified, make one of the most valuable medical symposiums a farmer-stockman can obtain.

PROBABLY RING WORM.—My cattle is troubled with a skin disease. Seems to start first around eyes. They are very uneasy, rubbing affected parts until skin gets very red and sometimes bleeds. First noticed it on one, now nearly all have it; also a colt which sometimes runs with cattle. Please advise me what to do. I have been using creolin and kerosene.—O. O. M., Venango, Pa. It is quite probable that these animals have ringworm. Try painting the affected areas every other day with tincture of iodine. If applied with a small brush, care should be taken to avoid getting any in the eyes. Two to four applications are usually sufficient to effect a cure.

INTESTINAL PARASITES.—My pigs are not thriving well. One of them was hearty in the evening and next morning she was dead. I butchered one the other day. She had worms in the stomach and in small intestines. They have no appetite. Is there any advice you can give me?—H. B. S., Middleburgh, Pa. These pigs should be treated for worms, using capsules prepared for this purpose. These should be secured from your veterinarian as he will be able to supply you with a better grade of capsules than ordinarily marketed. Rotation of hog lots with plowing of ground is advantageous in preventing infestation. A good feed mixture for growing pigs consists of a mixture of 100 lbs. corn meal, 10 lbs. tankage, 5 lbs. oil meal, 5 lbs. chopped alfalfa.

EWES ARE WEAK.—I have two ewes that seem to be too weak to stand up on their feet. I feed them corn, oats, hay and fodder. Some people say they have worms. Do you think the worms help them to be weak?—H. A. S., Forest Hill, Md. The difficulty here is probably due to parasites. Our attention has recently been called to a number of pregnant ewes, showing an increasing weakness, and finally unable to get to their feet, death following. Post mortem showed the intestinal wall to be filled with the encysted parasites resulting in a condition known as nodular disease. These cannot be removed from the intestine when once they are encysted. Rotation of pastures, use of drenches and application of preventive measures should control this condition.

SCOURS.—I have two cows that have been scoured for nearly two years. Ever since they were fresh the first time they have had scours. They stay rather thin in flesh but have good appetites. Have fed powders but seems to do no good. Please advise me what is best to do for them.—W. N. B., Bedford, Pa. The cows may have a disease involving the intestinal tract. In any case, there is some irritation which should be removed, if possible. Try giving one quart of raw linseed oil every other day for three days. Follow with tablespoonful doses of equal parts of bismuth subnitrate and salol three times daily. Call your veterinarian's attention to these cases when he visits you.

COWS PASS BLOOD.—We are having trouble with our young cattle aged from one year to fourteen months old. They pass blood thru rectum with manure. We are feeding good timothy and clover mixed hay, also corn fodder daily, two feeds of each. They get good pure water to drink with oats at each feed.—C. W. B., Falls Creek, Pa. This trouble seems to be common in some cattle and is not of any serious consequence unless associated with a loss of weight, diarrhea and a general disturbance. We have some cases where parasites in the wall of the intestines may cause blood in feces. Give each animal one-half to one pound of oil meal daily in feed and provide free access to a mixture of four parts bone meal flour and one part salt.

No Splints or Spavins here!

THERE'S no excuse for either. They disappear quickly with the application of Gombault's Caustic Balsam.

This 42 year old standard remedy is unexcelled for practically all lameness to which a horse is liable. You can apply it yourself simply by following directions that come with bottle. It positively leaves no scar or blemish.

Don't let your horses suffer from strains, sore, swollen tendons or lameness of any kind. Horses are too valuable. Their work means too much to you to let them get out of condition. Get them fit—keep them fit with Gombault's Caustic Balsam. $2.00 from your druggist or direct from us on receipt of price.

For Your Spring Work And Spring Pleasures

Every call of the new Season, Every Spring need can be met in the pages of your Ward Catalogue

This Spring your Ward Catalogue will enable you to buy three things for the usual price of two.

You have a copy of Ward's Spring Catalogue — or a friendly neighbor has. It offers you an opportunity to buy the *extra* thing, the fishing rod, the camera, the new tools, or curtains for the home, a rug, or milady's dress, *without extra cost.* The price is paid by the saving you make in *using* Ward's Catalogue to buy all your needs for Spring.

$60,000,000 in Cash Was Used To Make Your Savings Possible

Wise buying is largely a matter of deciding *where to buy.* Who can make the lowest prices? Who has the power to buy goods cheapest?

You and 8,000,000 other customers give us a buying power so vast, so enormous that we contract for shoes by the hundred thousand pair, we buy the new live rubber for our tires in the Orient. $2,000,000 worth of rubber was bought when prices were low.

$60,000,000 in cash was used to make possible these low prices this Spring for you. And every low price is a genuine low price. We never sacrifice quality to make a low price. We make our low prices by big buying, by the use of cash, not by cutting quality.

Use Your Catalogue—Send All of Your Orders to Ward's

This Spring buy wisely. Compare prices—always remembering that quality, guaranteed quality, is equally as important as price. And Ward's quality is guaranteed. For 54 years we have dealt with our customers under the policy of the Golden Rule. You always buy on approval at Ward's. "Your money back if you want it."

Fordson Power
Reduces Production Costs

Soil is the farmer's working capital. On its proper handling depends the profits of the year's work.

A perfect seed bed, plowed, harrowed and pulverized at just the proper time is the best crop insurance.

With Fordson power and modern tillage implements at hand, the delays of weather and soil conditions cannot interfere with the raising of a profitable crop.

Over half a million Fordsons are in use and farmers everywhere report their help in building a proper seed bed increases not only the quantity but the quality of their yield.

Ask your Ford dealer about the payment plan which makes it easy for you to be sure of a better crop this year with Fordson power.

On June 6th a year ago Immel Bros. of Yellow Bud, Ohio, had 108 acres in corn.

On that day the Scioto River overflowed and covered their corn field until June 12th. Replanting, of course, was necessary.

On June 21st, using Fordson tractors, they started to prepare the land again, finishing June 28th. They cultivated this corn three times in ten days with Fordsons and two row cultivators.

The certified yield was 6,480 bushels of good quality corn, or $5,184.00 worth of corn which would have been a total loss without Fordson power.

The Truck a Factor in Marketing

Nearly Everyone, from Junk Dealer to Ice Man, Went into the Potato Business

By DANIEL DEAN,
Tioga County, N. Y.

THE potato growers of New York, New Jersey and Pennsylvania are finding the motor truck to be a far more important factor in potato marketing this season than ever before. The proportion of the crop marketed by means of the truck has been greatly increased.

The reason is the very short one that truckmen have been able to make big money this season. They have made dollars out of high priced potatoes where in other years they could only make dimes or quarters out of low priced. Many hundreds, if not thousands, of truckmen in these three states have gone into the potato marketing business for months at a time. Often they have been able to make a trip of over one hundred miles and buy a load of potatoes to resell at a price which would pay all the heavy costs and still have a profit left. If they had not, they would not have repeated the trip.

High Prices Gave Truckman Large Profits

It is worth while for the potato grower to study the reasons for the big expansion of potato truck marketing and try to find out where there are lessons in it for his own use. In the first place it is the high price this season which has made trucking profitable. The truckman buys and sells potatoes just the same as any other wholesale merchant. As with most business, his margin of gross returns, of increase in price for doing the work of handling the article is made on a percentage basis rather than on an absolute one. That is, if potatoes are at twenty-five to fifty cents a bushel or less, as they were last spring, the truckmen would not be able to find grocers, hotels or restaurants willing to pay more than a ten or fifteen-cent advance. When potatoes are from $2.00 to $2.75 a bushel, the truckman can get from twenty-five to fifty cents a bushel above what he pays the grower as easily as he got ten or fifteen cents last spring.

It costs the truckman just the same to load the truck and to unload it with potatoes at one price as at another. With potatoes scarce as they often are now, it takes him longer to find a grower willing to sell, but on the other end of his trip he finds it much easier and quicker to find buyers. He is not meeting the same competition with growers hauling in wagon loads. The increased margin of gross returns from each load is at first all profit. But not for long.

This country is full of keen business men, all anxious to jump into every opportunity that promises a few extra dollars. Just as soon as trucking potatoes shows a good profit above the cost, hundreds and thousands of other trucks are taken away from businesses which show less profit and sent out into the country after potatoes.

A junk company here took its three trucks off collecting junk. One ice company used a fleet of big trucks at the end of its ice season when cold weather began. Everywhere many small trucks which work from day to day at whatever offers the best pay turned to the potato trade. If it could be possible to get the figures in bushels of the amount of potatoes marketed by truck from last August to February in these three states there is no doubt that it would run into a total of millions.

The second cause for the big movement was the very unusual growing season. The long and severe drought which extended along the Atlantic Coast lasted until the New Jersey potato crop was so nearly mature that it received but little benefit from the rains. For the last eight years, 1917 to 1924, Jersey has marketed an average of a little over 8000 cars of potatoes each year. It is very interesting to see by the car lot records that almost exactly one-half of these, about 4000 car loads a year, were shipped before September 1, the other half after. The 1925 crop ripened early with the drought. Growers were afraid to hold, as the Long Island crop coming on the market next was expected to drive down prices. So they shipped 3064 cars up to September 1, and only 298 cars after, tho additional shipments equal to several hundred carloads were marketed by truck.

Feared Effects of Late Blight

Over the great up-state New York territory, which grew close to 40,000,000 bushels of potatoes in 1924 and marketed 14,460 cars by rail, the 1925 crop struck a number of troubles. Short acreage, poor stands, and then in July, August and September a very heavy rainfall. The bean crop was very badly damaged by excessive rains and both oats and barley are showing very poor germination on test.

The Most Intelligent Farm Animal

Our Four-footed Friends Display Many Human Traits, Readers' Letters Show

Gray Dolly and Lady
Awarded Prize of Five Dollars

A FEW years ago a carload of horses was shipped into Pennsylvania from Wyoming. Among them was a beautiful little gray mare to whom my brother's wife took a fancy, so they bought her and named her Gray Dolly. She was practically unbroken, and all efforts to break her proved futile. Giving her up in despair my brother turned her into the pasture along with his herd of Guernsey cattle, among which was a wicked bull.

One day, when he went into the pasture, he was attacked by the bull. Gray Dolly was grazing some distance away but she saw the attack and instantly ran straight at the bull. Whirling about she attacked him with vicious, lightning-like hoofs, before which the bull retreated. With great backward leaps she followed, and did not abate her attack until she had driven him to another part of the pasture.

My father once owned a little sorrel maro named Lady. One day he turned her and her three-day-old colt into the meadow adjoining the house. The following night he was awakened by Lady running to the yard gate and then back into the meadow, stamping her feet and neighing frantically. Knowing that something was wrong he went out to investigate.

Lady met him at the gate and when he spoke to her she whinnied and ran back to a rampit in the meadow. He followed her and when he got to the rampit he found the colt had fallen in. As he climbed down to lift the colt out Lady stamped around, sometimes getting down on her knees and reaching her nose down as far as she could, whinnying pitifully. As my father placed the colt beside her, her terror turned to joy. She nosed him tenderly, whinnied joyfully and dashed away with him, and was never again known to take him in the region of tho rampit atlho they stayed in that meadow the entire summer.—E. L. B., Chester County, Pa.

Beauty protects the children. Here she is guarding little Hillard Alfonso Dawson, of Ocean County, New Jersey.

He Brought Home the Bacon

ONE stormy February morning in 1917 we slaughtered two hogs in the orchard. We then loaded them in a wagon and took them to our neighbors, about a quarter mile away, to be dressed and hung up in the barn. By the time this operation was over it was storming harder than ever. After the usual dinner and social hour we went to our several homes, finished our chores and had supper.

While making tne regular rounds by lantern light around the barn, I noticed that Stace, our white Collie dog was not in his usual bed, nor was he around at feed time. Fearing that he was caught in a trap, the boys put on their wet-weather clothes and went around the forest, but no dog could be found. We retired that night with the waiting question, "Where is our wandering dog tonight?"

Morning broke and still no trace of the dog could be found. On my way back home from taking the milk to the station I met our neighbor and he told me that our white dog had lain beside our hogs all night and he could not drive him home. He was still there, said our neighbor, and I stopped in on my way home and loaded the hogs in the milk wagon. The dog followed me home with one eye on the hogs until they were safely stored in the cellar.

If this dog did not have any intelligence why did he watch the pork all night, instead of coming home for his supper, and lying in his bed in the hay?—D. S. C., Burlington County, N. J.

Humpty Dumpty Obeyed

WE ALWAYS talk to our hens and train them so that from chickenhood up they try to understand what we say, and listen and cock their heads when we speak to them.

One fall a brood of chickens was sleeping in an old barn and one night it was blown down. All but one pullet went to the henhouse. She came to the house and slept under the kitchen. She was large and dumpish and was named Humpty Dumpty. We thought she would soon tire of the life of a hermit, but no, weeks (to page 26)

Cletrac Power on the Farm~and More Money in the Bank

CLETRAC power on the farm means more work done at less cost—larger yields from every acre—and greater profits at the year's end. Cletrac Crawler Tractors make light work of the hardest farm tasks. Heavy plowing, discing, cultipacking, seeding and harvesting are all finished in less time—with far greater ease—and at a substantial saving in labor and money when Cletrac is on the job.

Positive Traction—No Power Wasted!

Cletrac power is *usable* power. The broad tracks prevent slippage—increase traction—and reduce fuel costs. The evenly distributed weight of this modern, powerful, easily-handled tractor means a pressure no heavier than a man's foot. The Cletrac never packs or hardens the ground. Turning easily within its own radius, the Cletrac works "close-up" in corners. It does excellent work on hillsides—travels sure-footedly over soft ground and wet spots—over ice, snow and slippery mud. And its operating cost is remarkably low.

Cletrac Crawler Tractors are made in two models: Cletrac "W," which pulls a two-bottom, 14 inch plow easily, and Cletrac "K," the latest model, which handles perfectly a three-bottom, 14 inch plow. Write us today for complete details and actual working views of these two labor-saving tractors that earn big dividends throughout a long lifetime of thoroughly dependable service. The coupon below will bring you full information.

NESHAMINY GARDENS

Where an Editor Works and Thinks

By R. P. KESTER

THIS is the month in which to prune grape vines. If the work is left until a warm spell starts the sap to flowing the cut ends "bleed" badly, sometimes to the extent of reducing the vitality of the plant and lessening the crop. The great majority of grape vines outside of regular vineyards are woefully neglected as to pruning. While the neglected vine will produce a great many grapes, they are usually not salable because there are few large or perfect bunches. A grape vine which is allowed to have its own sweet way scarcely ever bears a large perfect bunch.

✤ ✤ ✤

THE time to begin pruning a grape vine is the first year, and annually thereafter. If a vine has been allowed to grow at will for a number of years it is very difficult to bring it into good shape. The best plan is to cut it off at the ground and let a new stem start. Even if a vine is trained over the side of a building it is possible to keep it pruned back to a single stem with four or more side branches. These side branches should be cut back to five or six buds each. At Neshaminy Gardens we have the vines trained on a wire trellis made by driving steel posts sixteen feet apart on which are strung two ten-gauge wires two feet apart.

3RD. YEAR GROWTH AND PRUNING POINTS
B
A
C
3RD. YEAR GROWTH AFTER PRUNING

How to prune a three-year-old grape vine on two wires.

✤ ✤ ✤

THE grape vines are placed eight feet apart. A single stem is allowed to grow up to the top wire, and a branch is started each way along the wires. It requires about three years with proper pruning to train the vine up to this point. This being the third pruning for our vines the accompanying cut shows their appearence before and after pruning. The heavy short lines on the cut of the unpruned vine show where the cut is made. The right hand picture shows how the three-year-old vines look after pruning. Three to four buds are left on each branch.

✤ ✤ ✤

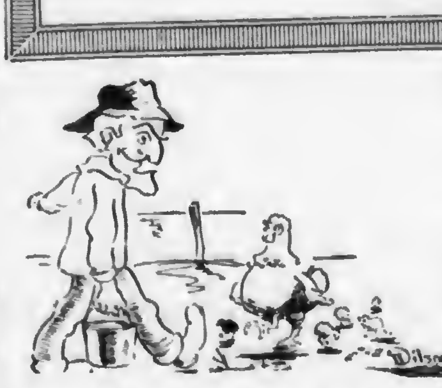
THE blackberry and raspberry plants will be pruned also this spring. This is not a very big job on plants set only one year, yet each one must be cut back. I pinched the tender tops off the red raspberries last fall because they were growing too tall and might be broken down by snows or blown over by the wind. When the apple and peach trees are added to this amount of pruning it is going to provide me some opportunity to "think" during the next few days.

✤ ✤ ✤

DURING the winter a great many letters have been received asking for specific information on planting and growing the different vegetable crops. I shall be glad to go into some detail on these subjects as the time approaches for planting them. The first thing to do when the weather fairs, probably the first of April, will be to finish out our planting of Mary Washington asparagus. Then will follow peas, radishes, onions and beets. The main crop of early peas will be of the Gradus variety.

THE CHEERFUL PLOWMAN

The Big Family



BIG families, I have heard it said, are subject to neglect; if they are clothed, and housed, and fed, that's all they can expect! "With time so short where is the dad or mother in the land who can take each poor little lad and make him understand the problems of a varied life, its duties and its ills, its alternating peace and strife, its valleys and its hills?" "Where is the parent, good or bad, in such an age as ours, where all the strength he ever had, his talents and his powers, are needed to bring home the bread, the bacon and the cheese, to keep the roof above the head, the patches on the knees,—where is the parent who has time to teach, deplore, and guide, to shoo the kids away from crime and to the better side?"

Such sage remarks I've always heard; but here's old Biddy here, a simple minded clucking bird with thirteen kids, I fear, and see how well she brings them up and tells them what is what! She guards them from the playful pup and from the weasel's plot, she looks out for their normal needs as she's supposed to do, she guides them to the better feeds and shields them nicely, too; but more than that, she teaches each the way he ought to go, she finds the time to guide, and teach the things each ought to know!

I'll bet my hat each child she rears will be a model bird who'll bring his ma no scalding tears thru mean and careless word! I'll bet my pipe these thirteen mites will grow up strong and straight, will always get in early nights and never taunt the fate! I'll bet each little girl or boy that Biddy has today will grow up full of truth and joy, will scratch and earn his way!—L. Edw. Tuft.

Champion X—exclusively for Fords—packed in the red box, 60¢

DEPENDABILITY

The greatest thing about a Ford is the way it keeps going, even under the worst conditions. The dependability of Champions—which have been standard Ford equipment for 14 years—is an integral part of Ford dependability.

A new set of dependable Champion Spark Plugs every 10,000 miles will restore power, speed and acceleration and actually save their cost in less oil and gas used.

FOUNDATION PLANTING

The Best Shrubs to Grow near the House

SHRUBS for planting around the house should be of the low-growing type, that is, when they have reached their fullest growth their height should not exceed three to four feet. The Slender Deutzia (Deutzia gracilis) is a familiar example of the kind of shrub adapted for this purpose. The old fashioned Slender Deutzia has white flowers, but there is a newer pink-flowered type (Deutzia gracilis rosea) which can be obtained from any good nursery. Lemoine's Deutzia Avalanche has larger and more showy white flowers than the Slender Deutzia, and is likewise a most attractive low shrub, its ultimate height being about four feet.

Several of the Spireas are suited for planting of this kind, and the fragrant white flowers and fine, light green foliage of Thunberg's Spirea make it especially valuable for foundation planting. Then there is the Anthony Waterer Spirea, with its flat-topped clusters of crimson flowers which, if cut as soon as they fade, will provide continuous bloom until frost.

Effective Color Scheme

The Mountain Currant (Ribes alpinum) is adapted to planting around the house, and would make nice specimens if planted on either side of the front doorway or steps. Not only are its spicy yellow flowers and deep green foliage most attractive, but it will do well in dry soil. The yellow-flowered St. John's Wort (Hypericum aureum), is another good dwarf shrub for such planting. It blooms in midsummer, and makes a pleasant bit of color at a time when very few shrubs are in bloom. Another interesting yellow-flowered plant is the Japanese Globe Flower (Kerria japonica florepleno). It blooms in June, has good deep green foliage, and its bright green branches make it especially attractive in winter.

For planting in shady spots around the house, or in the shrub border where low-growing plants are desired, the following-named shrubs are recommended: Oak-leaved Hydrangea (Hydrangea quercifolia), Regel's Privet or Japanese Privet (Ligustrum ibota), Snowberry, (Symphoricarpos racemosus), and Coralberry (Symphoricarpos vulgaris).

Include Shrubs with Berries

A few shrubs with berries should be included in the foundation planting, for the cheerful effect such plants have in winter. The pearly white fruit of the Snowberry looks very well planted near the scarlet-fruited Japanese Barberry; Snowberry and the lavendar berries of Beautyfruit combine most attractively, too.

If it is at all possible, it is advisable to invest in a few evergreens, for nothing can replace them for the effect of richness they give to the planting about the house. The dwarf forms, such as Ellwanger's Arborvitae, Mugho Pine, the Japanese Yew (Taxus cuspidata), and the native variety (Taxus canadensis) are hardy, and are well adapted by reason of their low spreading form of growth, to foundation planting in this section.

While all planting immediately

A hairpin tells *the* story

THIS unusual test demonstrates conclusively the intense heat of the Nesco burner.

A hairpin inserted in a potato and placed over a Nesco burner glows red hot in an instant. It is this intense heat, so necessary for perfect cooking results that has won the endorsement of thousands of women and made Nesco nationally known as the Gas Cooking Oil Stove. For though it burns kerosene, Nesco cooks with gas.

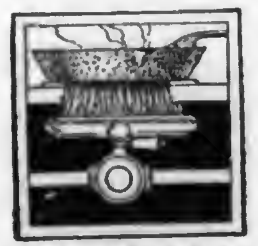
It lights like an ordinary oil stove but quickly develops that intensely hot blue gas flame that strikes and spreads directly against the base of the cooking utensil. A clean flame. No smoke. No soot. No smell. Economical, too. A Nesco burner will cook 24 hours on a single gallon of fuel.

And with its better cooking results Nesco brings to farm homes the beauty, cleanliness and work-reducing features of a city gas range.

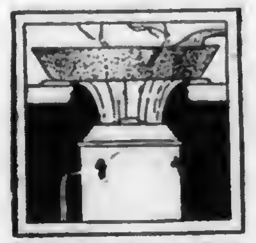
Go to your dealer and see it. Note its graceful colonial lines, its pleasing colors, its smooth, easily cleaned surfaces, its extra shelf room. Have him demonstrate the burner—over a million of which are in use; the patented, long lasting Rockweave Wick that requires no cutting and cleans by burning.

Then have him send a Nesco to your kitchen and see for yourself how this new day gas cooking oil stove solves your every cooking problem.

NATIONAL ENAMELING & STAMPING CO., INC.
Advertising Dept., 425 E. Water St., Milwaukee, Wis.
Branches at: Milwaukee, Chicago, Granite City, Ill., St. Louis, New Orleans, New York, Philadelphia, Baltimore.
Licensed Canadian Manufacturers: Dominion Stove and Foundry Company, Penetanguishene, Ontario, Canada.



The intense heat of a gas stove burner is due to the flame striking and spreading under the entire base of cooking utensils.



So also the blue-gas flame of the Nesco Burner strikes and spreads under the entire base of the utensil, producing an intense gas flame cooking heat.

Nesco's patented Rockweave Wick of wire woven asbestos. Non-burning. No trimming. Flexible. Long lasting.

OUR JOB is to serve our readers. Whenever you are puzzled write to us and we will help you if we can.

See deep enough, and you see musically; the heart of nature being everywhere music, if you can only reach it.—
Thomas Carlyle.

Why Be a Farmer?

THOSE who read the contest articles printed two weeks ago in which parents' reasons were given as to why the writers wished their sons to be farmers were no doubt struck by similarity of the reasons. These, and the scores of answers not yet published, emphasized this one point: The writers believe that farming offers the best chance in which to become a happy, useful and intelligent citizen. The highest hope of every parent for his son is just that.

Unfortunately, most of the parents' reasons as given will not be convincing to the young man just ready to start life for himself. He is not concerned so much about idealism as he is about advancement. His youthful ambition naturally causes him to put at the head of the list of desirable attainments position, power, wealth. He sees that all these are rather slow and uncertain in farming. While he realizes that few achieve them in other lines, yet there are enough who have to make inviting the chance in trying, and he always believes in himself enough to think he is certain to succeed. The educational influences in the life of the young tend to stress too much the desirability of worldly success, and too little the importance of immaterial possessions.

Pointless Arguments

WE HAVE had a few letters from people in one section of the state who are strenuously opposed to the work of testing cattle for tuberculosis. We have tried to clear up in a dispassionate way misunderstandings which exist in regard to this work. We have sympathy with those who have lost heavily and those who stand to lose by it in the future. They have grounds for feeling aggrieved, since the indemnity received scarcely ever fully reimburses the loser. We grant the objectors their claim to being honest and sincere in their opposition.

But we do believe people should be sure of their arguments. It is a mistake in any issue to accept as truth all that is said in the heat of a controversy. In this instance there is evidently a great deal of guesswork if not falsehood going the rounds. Some of the arguments used in opposition to T. B. testing are so ridiculous that we wonder at their acceptance. As an example, a writer states that one of the reasons why testing is being urged and forced is the desire of Philadelphia to get cheap meat during the Sesqui-centennial. Other examples equally silly might be quoted, but this will illustrate the kind of foolish talk we protest. Let the arguments on testing be limited to facts and truth, and we assure our readers that Pennsylvania Farmer stands ready and willing to print all such whether they be for or against the work. Loose talk and surmises, however, injure rather than help the cause espoused

Modern Mastodons

THERE is evidence that immense creatures once roamed the earth in the form of mastodons, dinosauria, megalosaurus, etc., and that great birds such as the dinornis which stood fourteen feet high were common. Science teaches us that the very immensity of these animals was the cause of their extinction. The changing conditions made it impossible for them to get a living and they perished from the earth.

A reading of the financial news of the day suggests that we are living in an age when new forms of gigantic creations are being formed. However, these modern mastodons are made of aggregations of wealth in the form of combinations of big industries and financial institutions. Railroads, banks, and manufacturing firms are "merging" on every hand. Other financial and commercial institutions are combining their interests. The combined wealth of these modern business associations totals billions of dollars. Theoretically, the tendency is in the interest of economy of operation and greater service. But time alone will tell whether human intelligence is great enough to handle successfully these immense sums, and also whether men are honest enough to be trusted with the power which such piles of wealth give them. Will future ages find them still doing business, or will it record finding of the skeletons of business of mastodon size?

When Doctors Disagree

WE ARE often reminded of the impatient question Herbert Hoover asked during the war after hearing contradictory demands made in the interest of agriculture, "Well, who IS authorized to speak for farmers anyway?" The present situation in regard to congressional action finds the lawmakers in about the same uncertain frame of mind as was Mr. Hoover. All the different measures before Congress have opponents as well as proponents among farm leaders. For instance, a large group in the Middle West is strongly in favor of the Dickinson Bill while the National Grange and many others oppose it. President Coolidge approves the passage of "some form of agricultural relief legislation" without committing himself to any of the specific measures. Secretary Jardine is opposed to the Dickinson Bill but will not use his influence against it. The National Co-operative Association opposes this bill and recommends universal cooperation as a sufficient remedy, while the Indiana Wheat Growers' Association sends a series of articles purporting to prove that the dark tobacco growers' cooperative is a flat failure.

So it goes thru the entire list. Is it any wonder that Congress is worried and uncertain? It must be said, however, that the agitation on both sides has its origin among farmers and is not the result of effort on the part of ambitious politicians, as the city papers are wont to claim. The politicians in this matter take their cue from their constituents and from the mass of misinformation and false reasoning coming from city paper editors and other would-be teachers of agricultural economics who have selfish reasons for their antagonism.

The Uncertain Human

IN AN effort to relieve traffic congestion in downtown Philadelphia, an ordinance recently was put into effect forbidding all parking of automobiles on some of the principal streets. The public immediately thought, Now the garage men will get rich; people will be forced to put their cars into some of the big garages in the center of the city instead of letting them stand on the streets all day.

The garage men thought likewise, but they have undergone a great change of feeling in the last few weeks. It seems that in the old street-parking days everyone brought his car to town, and those who came after all the street space was taken had to park in the garages. Now everyone knows there will be a policeman to keep him from stopping in his favorite spot, whether he gets to town early or late. So he leaves his car at home, and the garage man worries about his small volume of day storage business.

Several business sermons might be hung on this narrative about the mis-calculation of these garage men. They forgot, like many farm organization leaders, that they were dealing with human nature, not with some concrete thing like bricks or plowshares or ax handles. The great need among farm marketing organizations for leaders who know business and who know human nature is emphasized by such far-fetched stories as this. Remember the old saying: "You can never tell which way the cat will jump."

Four Men and a Ship

A MAN in New York City owned a ship. Four of his friends wanted to hire that ship to go to Europe. The owner figured out that it would cost, let us say, $100,000 to run that ship to Europe. His friends didn't have the necessary money, and didn't know where to get it, but it was important that they find a way to cross to Europe.

The man who owned the ship solved the problem. He put an advertisement in some of the newspapers and magazines saying that his ship would sail for Europe on such-and-such a date, and that it would accomodate several hundred passengers at a cost of $200 per person for the trip.

The advertising revealed the fact that there were many hundreds of people who wanted to go to Europe. They and the ship owner's four friends signed up and sailed on the stated date. Thus the four men crossed the ocean at a cost of $200 each, instead of $25,000 each, which they would have had to pay if the owner hadn't found many others to go along and share the expense.

The principle illustrated by this tale explains why advertising has become such a force for good in modern life. A man builds a factory to turn out a piece of farm machinery. If he sells one machine only, all the heavy expense of maintaining his plant must be charged up against that one. But if he advertises, and finds many customers, he can charge a lower price, for the cost of maintaining the factory is divided among many. That is why widely advertised goods are nearly always cheaper than similar unadvertised articles that carry heavy "overhead" charges.

Washington Letter

THE DRIVE IS ON.—The Middle West drive upon Congress for agricultural relief legislation is on. It began when the committee of twenty-two selected at the Des Moines conference to represent eleven middle western states, headed by George N. Peek, of Illinois, established headquarters in Washington. A conference of the committee of twenty-two with a delegation of congressmen and senators representing each of the eleven states was held March 1st. At this meeting Congress was warned by Mr. Peek that if no relief legislation is enacted at this session a new political alliance of the South and West could be expected.

CALL ON THE PRESIDENT.—Accompanied by a congressional committee from the eleven Middle West states, the surplus disposal legislation promoters called on President Coolidge. Secretary Jardine was present at the President's conference. The hearings on the Dickinson bill and other surplus disposal propositions were begun before the House Committee March 4th.

WANT AN EXPORT CORPORATION.—The leaders say they want legislation creating a Federal Farm Board with broad powers to handle the surplus farm products, and to hold the same position in relation to agriculture that the Federal Reserve Board holds to the financial system. They also have in mind an agricultural export corporation organized and financed by farm organizations. Beyond this little that is definite has developed. The congressional committees say they are already well informed regarding agricultural conditions and that there is little need of the farmer spokesmen spending their time describing the farmers' plight. What they want is a concrete remedy which they can put into legislation.

SEED DYEING BILL MAY PASS. The clover and alfalfa seed dyeing bill is said by its friends to be in a favorable position and in a fair way to pass Congress this session. A new pure seed bill introduced by Representative Hare, of South Carolina, covers all sorts of seeds and bulbs entering into interstate commerce. It provides that all interstate shipments of seeds or bulbs shall bear a uniform label showing name, variety, and percentage of purity or freedom from inert matter.

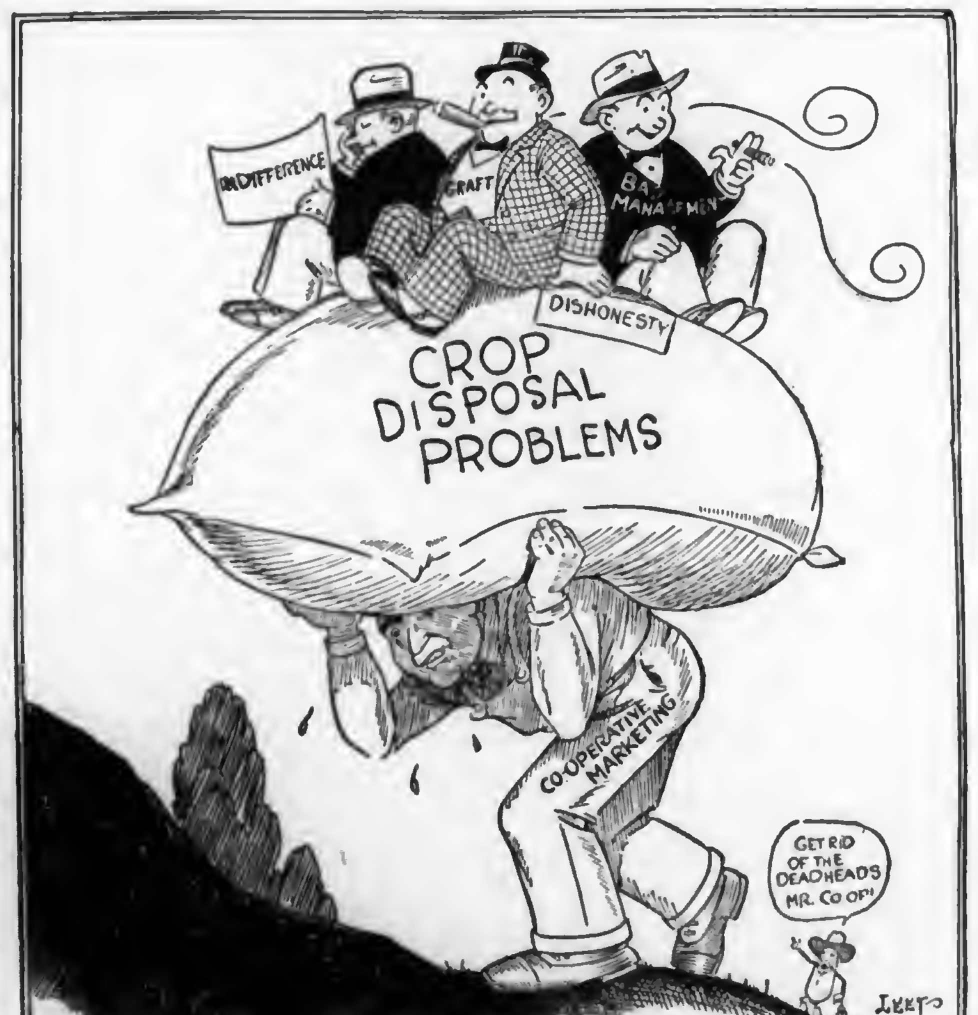
Efforts are still being made to induce the farmers of the Dakotas to go into the dairy business as a means of developing their agriculture. A bill introduced by Representative Sinclair, of North Dakota, and reported out favorably by the House Agriculture Committee, provides an appropriation of $25,000 to establish a dairying experiment station in connection with the Great Plains experiment station at Mandan, N. D.

DIRECT MARKETING TRIAL FAILS.—Last year Congress authorized the Postmaster General to conduct experiments with fifty rural routes to encourage the direct shipment of foods from producer to consumer by parcel post. This experiment has just ended in failure. Notwithstanding a systematic attempt was made to interest postmasters, rural carriers, producers and consumers in the direct from farm to consumer project, with low rates of postage and commissions to carriers, little interest was aroused and the volume of business was negligible. In reporting the experiment, the Postmaster General says that the results lead to the conclusion that there is no public need or demand for this character of service.—E. E. Reynolds.

Harrisburg Letter

RURAL ELECTRIC RULES STAND—Unless court appeal upsets them the rural electric regulations promulgated last fall by the Public Service Commission will stand and service must be furnished by companies when petitioned by certain numbers of customers per mile. The Commission has overruled efforts for rehearings and to revoke the regulations. The regulations became effective March 1, but owing to no rates being filed the situation as regards operation has been a bit vague. However, in a short time it is expected a clarifying statement on the matter will be issued here. This is about all in the way of electric regulation probable for the present except that the Giant Power Board is showing a disposition to hold up many charters for electric companies until their place in the scheme of unification of service can be worked out.

ASKING MORE SPACE.—Now that the next mid-winter Farm Products Show has been set for January 17, the week of the next inauguration on Capitol Hill, the question of getting more space, especially for exhibits of livestock, will be put up to the people of Harrisburg as the idea of scattering around the exhibits and meetings has not proved satisfactory. A conference with people active in civic affairs in Harrisburg will be held shortly at which the situation will be put squarely up to them.



Why cooperative marketing organizations fail.

CERTIFIED SEED SOON.—In all probability formal announcement will be made of grading of certified seed potatoes about March 15 as final drafts of the regulations are now being made up, following one or two changes resulting from the conference and hearing at the Department of Agriculture a few days ago. Objections to some of the provisions were argued at length. The Department will also rule soon on registry of Holstein-Friesian cattle which is assuming important proportions, owing to the effect of registry in determining value of cattle when killed in the state campaign to reduce bovine tuberculosis.

NEW FIGURES SOUGHT.—The statistical bureau of the Department of Agriculture is asking for information this month as to the percentage of grain stocks still held on the farm, this inquiry being regarded as of much value in view of the movement of prices the last six months. There is also an inquiry being made as to the amount of grain shipped out of counties.

HUGE MILEAGE AWARDED.—Thanks to the lively competition for Pennsylvania road construction the commonwealth will begin the spring season with probably more new work under contract than ever before. Every letting so far this year has produced more bidders than known at any time in the last four years and contracts have been let at what are considered very favorable prices. Most of the state contracts have been let for important links on much traveled highways, but now considerable county work which will be paid for in part by the state money or supervised by the state is coming in.

REGULATE LABOR CAMPS.—The State Industrial Board is about to make operative a plan for proper sanitation of labor camps in all parts of the state where men are fed or given lodging and to bring them under close supervision. The regulations are to be put up for hearings, but it is planned to make them effective this summer.

STATE POLICE CHANGES.—Changes in the districts of State Police troops will mean comparatively few changes in sub-stations this spring, but where removals take place they will be to points where state road routes converge and there are good telephone facilities. The patrol work will continue as heretofore, but plans for increase in mobility of the force are being worked out.

POOR FARMS POOR.—According to the newest report by the State Department of Welfare on care of the poor in Pennsylvania the majority of so-called poor farms maintained by townships or boroughs are poor affairs and efforts will be made at the coming session of the legislature to concentrate care of people under counties and to make the county homes hospitals in greater sense of the word.—Hamilton, Harrisburg.

New Jersey Letter

DRIVE AGAINST CHICK DISEASE.—Over 45,000 breeding hens have been tested this season in the drive of the State Extension Service against bacillary white diarrhea in poultry. These flocks, under a survey just completed by the experiment station, will produce over 1,000,000 chicks this year or nearly enough to supply the state in case producers elect to secure their supply of chicks entirely from tested flocks. In addition, the fowls under test have been culled for type and egg production. This testing of breeding flocks is one of the most effective pieces of work in recent years to improve the rapidly increasing commercial poultry business in New Jersey.

DEPARTMENT SEEKS HARMONY.—In order to acquaint the annual convention delegates, to which the New Jersey State Board of Agriculture is responsible, the State Department of Agriculture called a conference in Trenton on March 4 for detailed discussion of its projects now under way. Delegates who were invited include the holdover delegates from each County Board of Agriculture and one delegate from each organization entitled to representation at the convention. In mid-February the Department formed a council consisting of its department chiefs, the state entomologist and the state plant pathologist, for discussion of problems affecting the entire department. Success in this effort resulted in the continuance of the council as a policy, with meetings to be held at intervals to increase the effectiveness and harmony of the Department's work.

HOLD REGIONAL CONFERENCE.—The New Jersey Federation of County Boards of Agriculture called a regional conference of the State Farm Bureau at Bridgeton on March 5 to discuss joint problems affecting the southern counties. Much progress was made toward developing more cordial working relations between the various counties and a tentative plan was adopted for assigning membership quotas to the member County Boards. A similar regional conference for the northern counties has been scheduled tentatively for March 19 at Somerville, N. J., and for a similar purpose. The New Jersey Federation will take part in the eastern divisional meeting of the American Farm Bureau Federation at Concord, N. H., this spring, being represented by H. B. Hancock, of Bridgeton, and H. E. Taylor, of Freehold, president and secretary respectively of the New Jersey Federation.

MILK DEALER COOPERATION.—The campaign of this last year to secure the cooperation of milk dealers in the state who purchase from producers, has gained ground rapidly. The State Department of Agriculture, which is charged with the responsibility of licensing these milk dealers, now reports 221 dealers licensed, the largest number on record since the work began. If the dealer's assets do not cover liabilities, or where complaints have been made against dealers, a bond is required and filed with the Department. This work is designated to locate and do away with unscrupulous dealers.

FIELD WORK COMMENCES.—Early March saw considerable activity in the fields in southern New Jersey. Early plowing was started by a few farmers in Cumberland and adjacent counties. Little winter damage is reported as yet, despite severity of blizzards and wind during February.—B.

New York Letter

CENTRALIZED SCHOOL IDEA FLOURISHES.—After being on the state statutes since 1914 with no effect till this year, the law to create centralized schools has worked very successfully in the past six months under the vitalizing help given by the new law granting state financial aid to the project. There have been eleven such schools organized within the past few months. The central school gets all the quotas of all the schools comprising it, one-half the cost of transportation of pupils, and one-fourth the cost of remodeling old or building new buildings. A large number of other districts are considering the plan. A bulletin on these schools is now to be had at Albany. Under a new bill rural schools will be helped by a provision to tax state-owned property in districts the same as on any other land.

ABANDONED FARMS BAIT FOR REAL ESTATE SHARKS.—Thus was designated the practice of selling and reselling worn out hill farms in this state by Dr. C. E. Ladd, direction of extension of the State College of Agriculture, in telling of a survey of "Connecticut Hill," in Chenango County, a typical hill section which should never have had its virgin forests cut. There are fifty-three uninhabited farms in this area and eighteen inhabited ones. Doctor Ladd pleads for making this a great forest preserve and recreation ground. He urges that such land be reforested for the state's future timber needs and for protection of water supplies.—M. G. F.

Every 200-pound bag of V-C Fertilizer used per acre, on Corn will produce under good cultural conditions, an increase of 10 bushels of grain, equivalent to 100 pounds of pork.

Fertilize For a Full Ear Well Matured

Back of every fully matured ear was a stalk that was well supplied with plant food during the growing season.

Make more bushels of sound ears by selecting a fertilizer for your Corn that will feed it at every stage of growth and mature it early.

V-C Fertilizers for Corn not only nourish the plant while small, but when it is forming and filling the ear. They give the corn a quick start in the spring, grow it rapidly, uniformly, and mature large, heavy, well-developed ears before frost.

V-C Fertilizers have an established reputation among leading Corn growers for producing heavy yields of sound grain.

Ask your dealer for V-C Fertilizers made for Corn, or write

Head of the Department of Horticulture
Pennsylvania State College

Jersey's Roadside Market Plan—More Trucks Used

AT THE winter meeting of the Pennsylvania State Horticulture Society, held in Harrisburg, Alexis Clark, director of the New Jersey State Bureau of Markets, reported promising results from the first year of the operation of the roadside market plan in New Jersey. A market receives state approval and has the privilege of using a sign to that effect, if it complies with the following regulations:

1. Owned by a farmer who produces sixty per cent in value of the farm products offered for sale during any one month.

2. Not over ten per cent in value of farm produce may be offered for sale during any one month which was produced more than fifty miles distant and this must be distinctively labeled as such.

3. The top or exposed surface of all packages or quantities of produce shall be a fair representation of the entire volume.

4. The market to be located at least ten feet from the edge of the highway and to afford ample parking space.

5. Products to be of average high quality.

6. All apples and white potatoes to be graded by the New Jersey standard grades.

7. Automobile accessories and other supplies may be sold but it must be primarily a produce market.

Adjustment of Fees

An inspection fee of $5.00 a year, and a sign rental fee of $4.00 a year are charged. If sales amount to over $1000 a year, the inspection fee is $10. The signs are attractive, in the state colors. Eventually the public will learn to look for them.

The whole proposition is voluntary, not compulsory, and growers will adopt it as a matter of self interest, to protect themselves against the competition of spurious roadside markets that are merely retail stores, supplied with produce from the city wholesale market.

E. R. Biddle, federal and state market reporter, located at Philadelphia, called attention to the great increase in the shipments of fruits and vegetables into Pennsylvania during the past few years. In 1924 the unloads of produce in the larger cities were:

	Carloads
Philadelphia	42,000
Pittsburgh	21,124
Scranton	4,674
Wilkes-Barre	4,022
Harrisburg	2,570
Altoona	2,570
Johnstown	1,845
Reading	1,685

This does not include the great quantities coming to these markets by truck from nearby farms.

Growth of By-product Factories

W. W. Chenaweth, of the Massachusetts Agricultural College, told of the rapid development of home by-products factories, for fruits and vegetables, in New England, and predicted a similar development in Pennsylvania and other states having excellent local markets. He based his conclusion on the following premises:

1. "The growing and marketing of the perishable fruits and vegetables is always attended with loss due to unmarketable grades and to oversupply, and often this loss becomes a serious matter.

2. "Market conditions would be vastly improved if we could eliminate a large proportion of the poorer grades.

3. "The bulk of the more perishable vegetables and deciduous fruits consumed in our large cities does not come from the farm but from the manufacturer.

4. "The per cent of fruits and vegetables consumed in the manufactured state is increasing as compared with the fresh product, because their preparation for consumption entails less labor than do fresh fruits and vegetables."

Two Types Advocated

He advocated small home factories, operated by an individual grower; or a larger cooperative enterprise operated by a group of growers. As he sees it, the farm by-products factory cannot supplant the large commercial factory or even enter into serious competition with them, "because their function is primarily the economic marketing of surplus crops to a discriminating trade which experience shows will grow as the value of these home made products becomes known. It, therefore, fills a need which so far has not and probably cannot be filled by the large commercial concerns."

Among the by-products now handled to best advantage by New England growers are sweet cider, pasteurized cider, apple sauce, apple jelly, apple butter, cider jelly, pickles, and canned vegetables of various kinds.

The Japanese beetle quarantine has been in force since 1919. According to C. H. Hadley, director of the Bureau of Plant Industry, "during that time millions of plants and millions of baskets of farm produce have been moved out of the area under restriction without, so far as is known, any infestation becoming established any considerable distance from the main infested territory."

Pennsylvania's Infested Area

In Pennsylvania, the present infested area includes all of the counties of Philadelphia, Montgomery and Delaware and portions of Chester, Berks, Lehigh and Bucks, a total area of 1800 square miles or one-twenty-fifth of the 46,216 square miles in the state. During 1925 the spread was less, proportionately, than in any previous year.

Director Hadley concludes, "The time has not yet come to lift the quarantine; the present situation, and the results secured thus far, would seem to justify even more strict enforcement than is now possible with the funds available."

A survey of the state reported by Porter R. Taylor, director of the State Bureau of Markets, indicates that only about twenty-five per cent of the apples and peaches produced in Pennsylvania is moved to market by rail, and seventy-five per cent by truck to local markets, or sold at the farm. "These figures clearly indicate that local markets and truck transportation are the most important outlets for the fruit crop of the state except in wholesale districts such as Adams, Franklin and Erie Counties."

The motor truck is being used for three purposes; to replace a common carrier, such as the railroad, to supply markets not now reached by the railroad, and to intensively develop local markets. In New Jersey, truck hauls up to 125 miles are common. In the judgment of Mr. Taylor, "the truck has a decided advantage over the railroad up to fifty miles, beyond that it can be used successfully only in the transportation of high-value commodities such as berries, asparagus, mushrooms, and, in some seasons, peaches. The presence or absence of a return load, which will carry part of the expense, is an important factor."

One of the effects of the increased use of trucks is a reduction in the service rendered by railroads in certain districts; special trains for perishables may be reduced or discontinued. This is a contingency that needs serious consideration in communities which are changing over from rail to truck service.

During the last few years there has been a marked increase in the use of the truck in Pennsylvania to supply small markets which cannot absorb carloads of fruit, such as the movement of peaches from Berks County into the hard coal districts. Franklin County peaches are trucked to Altoona, Johnstown and smaller markets further west. Apples from Adams County now are trucked into Lebanon and Lancaster Counties, and from Wyoming and Wayne Counties to Scranton and Wilkes-Barre. Within a fifty to seventy-five-mile radius, there is an extensive truck movement of fruit from Erie County.

New Production Areas

"One of the effects of the use of the motor truck will be the development of new production areas for fruits and vegetables in those districts where good roads are opened into sections which previously did not have satisfactory transportation. Perhaps the best example of this is the transfer of the market garden area from the immediate vicinity of Wilkes-Barre to a valley fifteen or twenty miles distant."

Mr. Taylor cautioned the grower to make a careful estimate of whether he has a sufficient volume of produce to justify the investment in a truck. In many cases he has not.

Paul L. Koenig, of the State Department of Agriculture, presented some results of the census of 1924. In number of bearing apple trees, Pennsylvania ranks third; in apple trees not yet of bearing age, fourth.

Bearing Trees

1. New York	9,454,127
2. Virginia	8,060,674
3. Pennsylvania	6,884,138
4. Washington	6,759,672
5. Michigan	5,519,230

Young Trees

1. Illinois	2,770,114
2. New York	2,457,970
3. Virginia	2,344,421
4. Pennsylvania	2,228,870
5. Ohio	2,119,232

Washington has fallen to fourteenth place in number of young trees, indicating a marked decline in planting recently.

The leading apple counties of Pennsylvania are:

Bearing Trees

1. Adams	443,413
2. York	320,050
3. Franklin	273,614
4. Bedford	263,063
5. Westmoreland	209,110

Young Trees

1. Berks	176,908
2. Adams	154,041
3. Westmoreland	114,122
4. Franklin	112,374
5. York	105,166

In total number of apple trees the rank is:

1. Adams	597,454
2. York	425,216
3. Franklin	385,988
4. Berks	374,857
5. Westmoreland	323,232

The most striking feature of this report is the recent rapid rise of the industry in Berks County and in Westmoreland County.—S. W. Fletcher.

4 Grape Vines Only 50¢

Hardiest kinds. Once planted and growing you won't part with them for ten times their cost. Every home, if only a city lot, has room for them.

Agawam Large amber-red berries on big bunches. Very sweet. Each 20c; 12, $1.50; 100, $10.00.
Concord Best known grape. Sure to succeed. Fine for grape juice 15c; 12, $1.25; 100, $8.00.
Niagara (White Concord). Best greenish-white grape grown. Each 20c; 12, $1.50; 100, $10.
Worden Large black berries. Bunches big. Extra early, hardy, sweet. 20c; 12, $1.50; 100, $10.

Strong, well-rooted vines Set of four best varieties **ONLY 50c**
Postpaid and Satisfaction Guaranteed

These Trees Doubly Certified–
You'll Get the Right Fruit From Kellys'

You are doubly protected against disappointment and loss by the True-to-Name Lead Seal of the Massachusetts Fruit Growers' Association and our own Guarantee.

The Association is, of course, outside our organization and disinterested. Its corp of examiners under the direction of Dr. Shaw—an eminent authority on fruit growing—have inspected and certified 85,000 Kellys' trees to be "True-to-Name" for the 1926 season. Their Lead Seal stays on the tree until it bears fruit true to name.

Our Guarantee is also a real protection to you. We have a reputation to sustain, built up over a period of 46 years, nearly half a century.

Our many years' experience and the fact that all Kellys' trees are propagated on whole root, imported seedlings—not on piece roots—planted on upland ground where there is good air drainage, account for the success of our customers.

And you save the middlemen's profit on the highest quality trees when you order Kellys'. Our Big Catalog is our only salesman—you buy from us direct and we are directly responsible to you for your results.

Ask About Our New Cortland Apple

To be fair, we must fill all orders in the rotation received. You should plan to order your selection of doubly certified "True-to-Name" stock early and let us hold it for you. So write today for your copy of our big 1926 Catalog.

Garden and Truck Crops

Planning, Planting, Fertilizing an Asparagus Bed

How should I proceed to set out a field of asparagus?—L. K. M., Chester County, Pa.

THE planting of a bed of asparagus is the beginning of a long time project. Four years will go by before the yield will begin to look big. The yield at the seventh year usually will be the maximum, (provided the weather conditions are favorable) from the seventh to the twelfth this maximum yield will average fairly close, after that time lower yields may be expected.

The setting out of an asparagus bed is somewhat comparable to planting an orchard. It means careful planning before the snow has gone. The seasons roll around so quickly that many times seeding or planting time is upon us before we are really ready. I believe we could all benefit by more preliminary planning, whether it be for a field of asparagus, tomatoes, cabbage or any other crop.

Varieties: The choice of a variety of asparagus should be made on the basis of quality of the shoots (size and color), slowness to feather out, and resistance to rust. Asparagus rust came into this country as an undesirable immigrant in 1896. It spread rapidly, reaching California in 1902. Rust was heaviest in the oldest growing centers. At Concord, Massachusetts, the growers were having difficulty in keeping up their fields. An appeal to the United States Department of Agriculture resulted in preliminary trials and the naming of Dr. J. B. Norton to take charge of the work. Years of careful study resulted in the development of the Washington strains. The originator's description of these is given in full.

Description of Washington Strains

MARTHA WASHINGTON: "The first-generation offspring of B32-39, Martha, pollinated by A7-83 Washington, the most highly rust-resistant strain of asparagus yet found. Shoots usually dark green with a heavy purple tinge, with a tight, pointed bud, and not branching out until well beyond the market height, with a clean, straight growth, and of the finest market type. This strain is rather late, and seems to avoid the late frosts of spring, which often result disastrously for growers of the early varieties. Martha Washington seeds are smaller than the average, and the seedlings are apt to be behind other strains in size until late in the first season, but this small size is overcome in later years, and its yield is second only to Mary Washington and perhaps to one or two of the newer unnamed strains."

MARY WASHINGTON: "The first-generation offspring of A5-11, Mary, pollinated with A7-83, Washington. This progeny lot has the largest seed and the largest seedlings of any combination yet tested. This size holds as the plants mature, so that anyone can pick out rows of this strain in our test fields without difficulty. The shoots are very large on the average, with a tendency to be oval in cross section; scarcely less high in color than Martha Washington, very early and prolific.

The high-branching habit of this strain makes it possible to cut unbranched shoots with good tight buds as much as two feet long. The branches of the mature shoots after they grow up are much less spreading than those of ordinary asparagus. While not as rust resistant as Martha Washington, this strain suffers no appreciable loss under severe rust conditions."

It is now seven years since plantings of these two strains have been made. Mary Washington under test has proved far superior. The marketable shoots are more satisfactory than any other strain of Washington. The difference is noticeable from the start, even size of seed. Varieties recommended are then in this order: Mary Washington, Martha Washington, Reading Giant and Palmetto.

Asparagus should be planted in April as soon as the ground can be worked up and before growth starts much.

The Ideal Soil for Asparagus

The ideal soil for this crop, which is to occupy the soil for a long time, is a well drained, deep, fertile, sandy loam. Well drained, fertile, well supplied with organic matter, this lets in the heavier soils which will grow asparagus successfully. Some markets are supplied with "grass" from California and the South. The grower competing with this shipped-in produce likes to use as early a soil as possible for his bed. Grow a heavily manured and thoroly cultivated crop the year before the bed is to be set, or grow a green manure crop to plow under, thus adding humus material.

Mark the field very accurately when setting the roots. The rows of plants should be just as straight as possible to make cultivation easier in future years. There is no standard distance to set the plants. I believe I would make rows five feet apart and place plants fifteen inches apart in row. Many Connecticut growers set plants only nine inches apart in row, claiming that larger yields are secured with a more continuous row of roots, but it is conceded that plants set at this distance apart do not produce as long as plants set farther apart. Planting five feet and fifteen inches requires 4900 roots while four feet and two feet requires 5445 plants per acre.

To plant, open up a furrow about eight inches deep by passing back and forth with a plow. Set the plants in place, put a handful of loose top soil under the crown, spread the roots well and cover with about two inches of top soil. The furrow is not filled level until the end of the second year's growth.

Responds to Fertilizer

Asparagus responds to fertilizer. From 1200 to 1500 pounds of a 4-8-4 fertilizer, applied along and in the furrow, should be applied after planting. It may be advisable to add nitrate of soda in two applications one and two months after planting. This should be applied at the rate of 150 pounds per acre. Asparagus shoots grow from the root which in turn are large or small according to the amount of top growth. Top growth receives plant foods in solution from the soil, changes them into carbohydrates (starch and sugars). From the green top growth these carbohydrates are transferred to the large storage roots.

The principle of feeding or fertilizing asparagus is to grow a good top growth in order that each fall the roots go into winter well filled with stored plant food which enables the plant to send up good strong shoots in abundance until the end of the cutting season.

One-year-old roots should be secured by purchase or by growing the previous year. With a good variety, proper care and feeding, an average yield of 1500 two-and-one-half-pound bunches may be expected after the fourth year.—W. T. Tapley.

Massey-Harris
Mowers
Are Clean Cutters

IF you wish to do your cutting with only one horse, you'll find the Massey-Harris No. 11 Mower exactly fitted to your needs. It is light of draft yet cuts all kinds of hay as clean as any large machine.

Nos. 20 and 21 for Large Farms

If you use a team or a Fordson, then you need one of these larger Mowers. They are strongly built for hard service by an organization that has been making Mowers practically ever since scythes went out of fashion.

These Mowers are splendidly balanced and are free from side draft. Special construction permits the Cutter bar to follow rough ground readily. The cutting begins the instant the wheels start. Special Fordson Hitch for tractor work.

See the Massey-Harris dealer during "Better Farm Equipment Week," March 15-20.

Foundation Planting

(Continued from page 5)

about the house must necessarily be of a low-growing type, it is possible to avoid monotony by using a few taller shrubs at the corners. Familiar examples of plants with graceful, drooping growth suited for this purpose are Van Houtee's Spirea, and Drooping Golden Bell (Forsythia suspensa). The Lace Bush (Stephanandra flexuosa) is also well adapted for such locations, but it is not recommended for planting in exposed places. It invariably winterkills, altho it will grow again in the spring. The orange and scarlet coloring of its foliage in the fall is very lovely, and the more subdued bronzy-red hues of Van Houtee's Spirea are equally as charming.

In order that light and air may not be shut out from the cellar, only very low shrubs should be planted near these windows. Care should also be exercised when planting near the house windows to avoid placing shrubs where they will eventually shut out light, and the view as well. Plant these taller-growing shrubs in the spaces between the windows, and put the low growing shrubs, such as Deutzia, Barberry, etc., in front of the windows. A specimen Lilac, such as the white Madame Lemoine, or of the rose-colored Belle de Nancy, or one of the hybrid Mockoranges (Lemoine's Avalanche), could be planted against the house in such places.

Vines are indispensable around the porch. Flowering vines, such as the Virgin's Bower (Clematis paniculata), Silver Fleecevine (Polygonum baldschuanicum), Honeysuckle, Wistaria, and the Climbing Roses (Excelsa, Dorothy Perkins, Gardenia, etc.) are especially recommended.—Mary C. McGovern.

Altoona Carlot Receipts

RAILROAD shipments of fruits and vegetables to the Altoona market declined slightly during the year 1925, according to the Bureau of Markets of the Pennsylvania Department of Agriculture. During the year 2,212 cars arrived, 24 less than during 1924, but in most of the other cities of the state for which similar records were collected, larger percentages of decrease were found.

Potatoes led the list of commodities with 339 cars unloaded, 19 more than last year. Arrivals from Pennsylvania dropped from 66 cars to 47. This, of course, does not include the large volume of local potatoes shipped in by wagon and truck. New York and Maine, competitors of Pennsylvania as potato producers, supplied 97 and 35 cars, respectively, more than double the volume of 1924. However, receipts of early potatoes from Virginia, Maryland, and New Jersey showed decreases, largely the result of smaller production in those states.

Mixed produce ranked next in size of receipts, with 269 cars.

One of the most striking differences was shown in the receipts of apples, the total for which dropped from 163 cars to 107 cars. Washington, which furnished 44 cars to the Altoona market during 1924, supplied only 10 cars during the past year. New York continued to be the largest source of shipments, with 62 cars, 9 more than the previous year. Carload receipts from Pennsylvania were just one-half of the previous year, amounting to 13 cars, but these figures, of course, do not include locally-grown fruit transported by truck.

Decided increases were noted in the unloads of bananas, cantaloupes, grapefruit, grapes, oranges and watermelons.

Lettuce was the only one of the important vegetables to be received in larger amount, while cabbage, celery, sweet potatoes and tomatoes all showed declines.

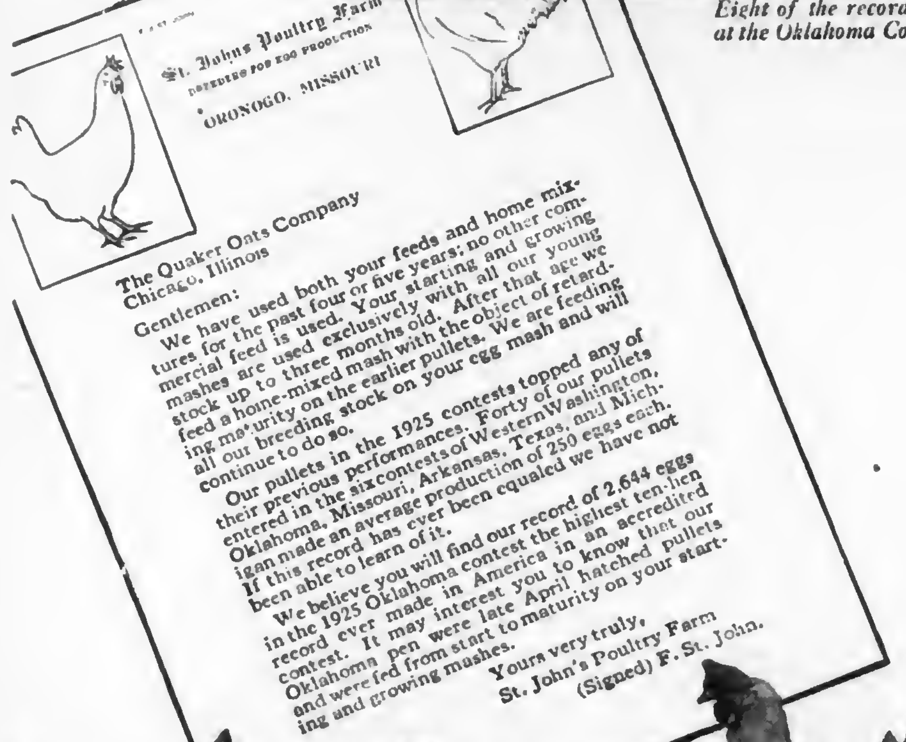
Eight of the record pen at the Oklahoma Contest



St. Johns Poultry Farm
BREEDERS FOR EGG PRODUCTION
ORONOGO, MISSOURI

The Quaker Oats Company
Chicago, Illinois

Gentlemen:

We have used both your feeds and home mixtures for the past four or five years; no other commercial feed is used. Your starting and growing mashes are used exclusively with all our young stock up to three months old. After that age we feed a home-mixed mash with the object of retarding maturity on the earlier pullets. We are feeding all our breeding stock on your egg mash and will continue to do so.

Our pullets in the 1925 contests topped any of their previous performances. Forty of our pullets entered in the six contests of Western Washington, Oklahoma, Missouri, Arkansas, Texas, and Michigan made an average production of 250 eggs each. If this record has ever been equaled we have not been able to learn of it.

We believe you will find our record of 2,644 eggs in the 1925 Oklahoma contest the highest ten-hen record ever made in America in an accredited contest. It may interest you to know that our Oklahoma pen were late April hatched pullets and were fed from start to maturity on your starting and growing mashes.

Yours very truly,
St. John's Poultry Farm
(Signed) F. St. John.

The record pen at the Western Washington Contest *A typical St. John's Bird*

Record Breakers raised on FUL-O-PEP CHICK STARTER

"From start to maturity on Ful-O-Pep Mashes," says Mr. St. John of his ten-hen pen which won the Oklahoma championship with a record production of 2,644 eggs.

Isn't that proof that Ful-O-Pep Chick Starter and Ful-O-Pep Growing Mash give birds a vigorous, profitable start in life?

Just look over this record of St. John's flocks for 1925:

Western Washington, 5 pullets	1,358 eggs
Oklahoma, 10 pullets	2,644 "
Missouri, 5 pullets	1,218 "
Arkansas, 5 pullets	1,253 "
Texas, 5 pullets	1,221 "
Michigan, 10 pullets	2,297 "

Total production, 9,991 eggs (average 249 31/40)

These records were made possible by the excellent health, laying capacity and vigor of these Ful-O-Pep raised birds.

Remember that Ful-O-Pep Chick Starter and Ful-O-Pep Growing Mash always have been wonderfully efficient mashes.

And, now they are better feeds than ever before because there has been added to them Cod Liver *Meal!* The meal has properties that enable chicks to reach maturity sound of frame, well-feathered, husky and ready for work or market.

Some good dealer near you sells the Ful-O-Pep line of feeds. He can supply you. Write for the new Ful-O-Pep poultry book. Tear off and mail the coupon now.

POULTRY

R. G. KIRBY
Staff Contributor and Adviser
Kirby Poultry Farm

Shall I Plaster It?

I am thinking of building a poultry house twenty by twenty feet this summer. Is it practical to plaster it? Would it be of any advantage to have the concrete foundation come up about twelve inches above the floor level to meet the studdings? How high is it best to have the house front and rear? Can bulletins be secured from the Department of Agriculture at Washington concerning poultry and poultry houses?—C. Y., Warren County, Pa.

It is not usually considered an advantage to plaster hen houses and very few are built in that manner. You can obtain bulletins on poultry house construction from the Poultry Department, State College, Pa. Farmer's Bulletin 1413 entitled, "Poultry House Construction," is for free distribution and can be secured by writing the Division of Publications, Washington, D. C.

You do not mention the type of house you will build. We have houses in which the cement walls extend six inches above the floor level and they have given satisfaction. Bolts are placed in the cement wall before it hardens and the two by six sills are bolted down to the wall to prevent the building from shifting in high winds. We have a shed roof house 4½ feet high in the rear and 8 feet high in front which has produced good results. The house is 18 feet deep. Our semi-monitor houses are 4½ feet high in the rear, 7 feet in front and 9 feet at the highest point of the roof.—R. G. Kirby.

Cooling Incubator Eggs

ONE of the debated questions in artificial incubation is the necessity of cooling the hatching eggs. The old hen leaves the nest and usually returns to cool eggs and yet produces fine plump chicks. It does not necessarily follow that the hen leaves the nest to cool the eggs. Maybe she is forced to leave the nest to obtain food and exercise.

The first four or five days I find the eggs become cool enough during the time required for turning. They contain little animal heat at that time. A general rule is to cool eggs about five minutes in a room where the temperature is sixty degrees. But as room temperatures vary it pays to cool them until the touching of several eggs to the closed eye proves that they are just cool. That is a sensitive point and quickly gives the incubator operator the probable temperature of the eggs. After a few tests it is possible to guess the temperature closely by touching the eggs with the hands.

Cooling the eggs may not be necessary to a good hatch but it does seem to give the eggs plenty of oxygen and helps to produce strong vigorous chicks. In cooling eggs it is risky to leave them out and go about other duties. If this is practiced some day you will wake up on a busy job and remember that the trays of eggs are still on top of the machines. The incubator will be cooled down and the eggs cold as stone.—R. G. Kirby.

Care of Day-Old Chicks

WHEN the boxes of baby chicks arrive do not leave them open for extensive observation on the part of the family and friends. The chicks may be chilled. They may be ravenously hungry and pick at each other's toes. If blood is drawn, some of the chicks may become cannibals and the toe pecking habit will be a trouble maker in the brooder house.

Examine the chicks in the presence of the postman or express agent and then keep the boxes closed until they reach the edge of the brooder deflector. This keeps the chicks quietly resting in the dark compartments of the boxes and they do not huddle or become chilled.

Do not feed the chicks in the boxes. They may eat soiled feed and this often causes digestive disorders. If white diarrhea should be present the danger of spreading the disease increases rapidly if the chicks are pecking at feed and droppings in the limited area of the chick box.

For a Few Days at Least

However, it pays to keep the chick boxes standing in the corner of the brooder house for a few days. If you have bad luck with a brooder fire and it goes out you may be able to prevent losses by quickly gathering up the chicks and placing them in the boxes until the fire is rekindled and the young birds can be returned to the brooder house floor.

Allowing brooder chicks to become very hungry is a common cause of toe pecking. Feed at regular hours and keep the starting mash before the chicks in hoppers and they are less apt to start the habit.—R. G. Kirby.

When Best to Hatch?

AS A general rule it pays to hatch the heavy breeds during March and April and the light breeds during April and early May. This gives the pullets a chance to mature and produce eggs when prices are highest and still avoid the moult which stops production.

But the rule is subject to variations because of the difference in breeds, strains and methods of feeding. All chicken statistics vary greatly depending on the skill of the poultrymen. This year a new factor has entered into the egg market. Winter eggs have been lower than usual. There is a chance that late summer and fall eggs will again be high. So some owners of light breeds are trying early hatching with the opportunity of selling a lot of late summer and fall eggs.

Early Hatched Light Breeds

These early hatched light breeds will produce broilers when the market is high. They will produce eggs when they are scarce. If they go into a fall or early winter moult and stop production they will receive a rest and be fairly good breeding stock next year with which to produce more early broilers and fall layers.

Late hatching has very little to recommend it. The broilers come on the market when prices are low because of the large output from farm flocks where summer hatching is carried on with hens and poultry is only a sideline. The late hatched pullets do not produce eggs until about January 1 when the price begins to drop rapidly. A week of early spring weather seems to do more for a chick than two or three weeks of hot summer weather. When the green feed is tender and the worms plentiful, the early hatched chicks are ready to make a rapid growth.—R. G. Kirby.

Have All the Same Age

HAVING all the chicks the same age simplifies the mixing of rations thruout the summer. Setting a hen every few days produces a lot of chicks of varying ages. Three or four weeks makes a lot of difference in the size of little chicks when they are ranging together. The larger chicks trample the smaller ones. Soon the little chicks are devitalized and do not receive their share of the feed. This results in culls.

When the chicks are of varying ages on the same range it pays to build slatted feeding coops in which the little chicks can eat unmolested by earlier hatched birds. But the better way is to have them all the same age. This can be done in several ways. Have an incubator large enough to hatch all the chicks at one time or buy day-old chicks. Save up the setting hens until you have ten or fifteen broody at the same time. Then place the eggs under them the same night. Test out the infertile eggs the same as in artificial incubation and combine the fertile eggs under the hens that seem to be the best prospects as mothers.

If Breed Shows Broodiness

If you have a small incubator and keep a breed that shows broodiness, it often pays to set the incubator and a few hens at the same time. All the chicks can be combined in the same brooder or small flocks of incubator hatched chicks can be divided among the hens for hen brooding.

Some poultrymen with a small incubator capacity, plan to fill their own machines and have a few hundred eggs custom hatched at the same time. Then their young stock growing on the range are all the same age.—R. G. Kirby.

The Eggs for Hatching

IT SELDOM pays to try to hatch eggs more than two weeks old and the fresher the eggs the greater the chances of obtaining a large per cent of vigorous chicks. Store the eggs in a room where the temperature will not be below forty-five degrees or above sixty-five degrees. As near fifty-five degrees as possible is best. Eggs will stand a temperature close to freezing for a few hours and produce good chicks but it is safest to gather the eggs often in cold weather.

On freezing days I gather hatching eggs five and six times each day and a large per cent of the eggs in the Barred Rock pens are taken from under the birds. Many of the White Leghorns are rather nervous and are frightened if an attempt is made to take eggs from under them.

Turned Eggs Meant More Chicks

I have tried saving hatching eggs for ten days without any turning and I have turned a similar number every day. The trays which later contained the turned eggs produced a few more chicks and in my opinion it is safest to turn the eggs every day if they are saved for more than three days before being placed in the incubator. A cabinet built like a home made oat sprouter makes a good storage place for hatching eggs. Small numbers can be placed in baskets and turned by moving one basket to another. Large numbers of eggs should be spread out on trays where they can be turned more rapidly.

The air in an egg will rise and the fluid contents settle when an egg remains in one position for many days. These abnormal shaped air cells will retard the proper development of the chicks and reduce the hatch.—R. G. Kirby.

By "looking ahead," Auguste Goffart, in 1874, began a development which ended in the modern silo. Today farmers are able to have green fodder the year around at low cost.

The one who looks ahead

FIRESTONE, by "looking ahead," designed and developed the Balloon Tire. Today practically every new car is being equipped with tires made by this low pressure principle, pioneered by Firestone.

The Balloon Tire has greatly increased the use of automobiles in the country the year around, by affording sure traction and greater comfort and safety on rough or slippery roads.

Gum-Dipping, the exclusive Firestone process, impregnates and insulates every fiber of every cord with rubber, building into the Full-Size Balloon longer service by strengthening the thin sidewalls to withstand the extra flexing strain.

This year buy tires by the name and reputation. Farmers everywhere should know that for twenty-five years the name Firestone on tires has meant Most Miles per Dollar. Trust the "one who looks ahead"—by seeing your nearest Firestone Dealer today.

If You Want Healthy Vigorous Chicks

Feed Globe Chick Starter

You start making or losing money on poultry just as soon as your chicks are hatched. You can *make* money and lots of it right from the start if you will feed your young chicks "The Globe Way"—the way that thousands of the most successful poultrymen have adopted and the way that brood after brood has been raised on our own experimental poultry farm.

Why take chances of *losing* money when you can follow "The Globe Way" and be assured of success?

Try the "Globe Way" this season and you will never attempt to raise chicks any other way or with any other feed.

Globe Chick Starter is a perfect chick feed—it is made from the highest quality ingredients obtainable—properly balanced in regard to animal and cereal Proteins, Vitamines and Minerals—exceedingly palatable and easily digested—the result of 23 years' experience in scientific development of a perfect feed for baby chicks. Your dealer can supply you.

FREE Baby Chick Folder

This valuable folder, "If they're Worth Hatching, they're Worth Saving" will show you how to avoid the customary chick losses—How to care properly for the chicks from shell to maturity. Just fill out and mail Coupon to us and we will send you this valuable folder free and postpaid.

Sheepman's and Cattleman's Knife. 3 blades—a large clip blade, a long, curved, correctly shaped surgical or docking blade, and a punch blade for drilling holes in leather and general repair jobs. Stag handle. Nickel Silver linings, bolsters and shield. Length, closed, 3⅞ inches. Price $2.50.

Pocket Knives for Farm Surgery

FOR farm surgery, altering, docking, marking, or dewlapping, you need a knife with a surgical blade that makes clean, quick-healing cuts.

Remington knives are scientifically designed for cattlemen, stockmen, farmers, ranchers, sheep and hog raisers. Each has a correctly shaped blade for veterinary surgery, and other blades for general use. Professional cutters endorse them.

Linings, bolsters, and shields are of nickel silver which will not rust or corrode and cause blood poisoning. Two popular patterns are illustrated. At your dealer's you will find many other styles, with different blade combinations and handles, at prices to suit every pocketbook.

Let Your Cows Pay for That New Silo

They'll do it, and thank you for the chance. Here's how. You can fill a Harder Silo with succulent silage for less than the cost of husking, hauling and stacking the dry fodder. And when you come to feed it, it will be worth twice as much, to say nothing of being easier to handle. At the end of the feeding season your cows will have paid for a handsome new Harder-Victor Front Silo.

Harder Easy-Payment Plan

Under this liberal new plan you can meet the payments out of the increase in your milk check and the saving in feed cost. You can't afford to go through another season without a silo when your cows will pay for the best silo ever put on a foundation.

Write for our free book, "Saving with Silos" and particulars of our easy-payment plan. Study the strong points of Harder construction. Learn how you can make bigger profits with a better silo.

Head of the Department of Dairy Husbandry, Pennsylvania State College

Detailed Directions for Feeding Calves

THE following is given in response to a reader's request for advice on calf feeding.

Let the calf stay with its dam three days. Then remove it from the dam and feed it eight to ten pounds of whole milk daily dividing it into three feeds for the first ten days after which the total amount of milk may be divided into two feeds daily rather than three. When it is two weeks old, you can begin putting in a little skimmilk or skimmilk substitute in the place of part of the whole milk. Make this change very gradually.

By the time the calf is four weeks old, it may be worked off entirely onto skimmilk or a skimmilk substitute. Start feeding it a little grain when it is about two weeks old by throwing a small handful of wheat bran or other grain into the pail when it is thru drinking its milk. It will soon learn to eat grain. A small amount of clover hay should also be supplied when the calf gets to be about two weeks old.

Skimmilk for Twelve Weeks

Keep on feeding skimmilk if you have it or a skimmilk substitute until the calf is at least twelve weeks of age. It will do better yet if it gets skimmilk or skimmilk substitute until it is twenty-four weeks old. Also gradually increase the allowance of grain until it gets about two to three pounds by the time it is twenty-four weeks of age.

A preparation which will serve nicely for a skimmilk substitute may be prepared as follows: Mix up equal parts by weight of hominy feed, red dog flour, linseed meal, and blood flour. Mix one pound of the calf meal preparation with a gallon of water at a temperature of 100 degrees F. and feed it the same as tho it were skimmilk. The calf meal gruel should be gradually introduced in the place of the whole milk making sure to see that only a small increase is made each time.

A grain mixture which has been used at the Pennsylvania State College to go with skimmilk or skimmilk substitute is composed of 100 lbs. of corn meal, 100 lbs. of ground oats, 100 lbs. of wheat bran, 50 lbs. of linseed oil meal and 8 lbs. of blood flour.

1. After ten days of age, a calf will do well if fed but twice per day. However, the hours of feeding should be regular and as nearly twelve hours apart as practical.

2. The temperature of milk as it is drawn from the cow is approximately 100 degrees F. Artificial feeding will maintain a uniform temperature of the liquid ration at all times and under all conditions, especially during the first eight or ten weeks of the life of the calf.

3. The digestive system of the calf is undeveloped and very delicate. This condition demands that careful attention be given to the amount of feed fed. The average calf has an appetite far in excess of its ability to assimilate. As a result, it is necessary to control the amount and kind of feed consumed. In other words, select the proper feed and do not overfeed.

Make Changes Gradually

4. Due to the sensitive condition of a young calf's digestive tract, it is necessary that all changes in amount and kind of feed fed be made gradually and regularly.

5. In order to be assured that each calf obtain the amount of feed specified, it is absolutely essential that they be fed in individual pails, rather than from a common trough.

6. After a calf is a few days of age, it is necessary that it be supplied with an abundance of good, pure water for drinking purposes.

7. After a calf begins to consume dry feeds, it is best to provide it with a small amount of salt each day.

8. The buckets in which the liquid rations are fed, as well as the trough used for the grain should be kept scrupulously clean, if digestive troubles are to be controlled.

9. The calf that is housed in a dry, airy stall, constructed of materials that are easily cleaned and located, and designed to admit an abundance of sunlight, has the most favorable environment for maximum development. Some of the most common and fatal diseases that attack young calves are caused to no small extent by requiring them to sleep upon a cold, damp floor. For best results they should be provided with an abundance of clean, dry straw for bedding, which must be changed frequently to keep the stall in good condition.

Roughage Very Necessary

10. The feeding of roughage, such as alfalfa or clover hay, is a splendid and necessary practice. If they prove to be too laxative, first substitute timothy hay or a good quality of oat straw during the first month or six weeks. A calf should begin to eat hay at ten days or two weeks of age.

11. The amount of liquid feed required by a young calf will depend largely upon its weight at birth. In general, calves vary in weight at birth from 40 to 115 pounds, and it is obvious that the same rule for feeding will not apply to all cases. One must exercise his own judgment in this matter to a certain extent, as the experienced feeder realizes the responsibility of the man in charge of the actual feeding operations.

Scours are Chronic Indigestion

12. Calf scours as they are commonly observed are simply chronic cases of indigestion. In treating this trouble, remove the cause, which may be overfeeding, feeding cold milk, feeding sour milk, or following improper sanitary precautions. Also reduce the ration at least one-half and immediately give the calf a tablespoonful of castor oil. If conditions do not improve at once (12 hours), obtain from your local drug store the following prescription: 1 ounce of bismuth subnitrate, ½ ounce of salol, 3 ounces of bicarbonate of soda.

When mixed together this appears as a white powder. Give one teaspoonful of this powder, mixed with one-half pint of milk, as a drench three or four times per day, until the calf has recovered. Guard the ration carefully after the attack of scours has subsided, to prevent a recurrence of the trouble."—A. A. Borland.

Cuts Down Plant Food Losses

There is real economy in a well built manure pit like this one on a well-known northeastern Ohio farm.

Memo: Get a can of Bag Balm

Next time you go to town, take this memo with you. Your can of Bag Balm will insure you against milk losses and annoyance due to sore teats, chaps, cuts, inflammation or injuries of any sort to the udder and teats of your cows. For caked bag, bunches, cow pox or any stoppage in the delicate tissues of the milk-giving organ the penetrating, healing power of Bag Balm is the ready answer.

Used by hundreds of thousands of farmers regularly for all kinds of animal sores. Big 10-ounce package, 60c at feed dealers, general stores, druggists. Order direct from us if you have trouble getting Bag Balm.

Free Trial of Proved Swedish Abortion Treatment

Famous Foreign Formula quickly relieves badly infested herds. Gives amazing results in cases believed hopeless.

Thousands of American Farmers say the Froberg Swedish Abortion Treatment has saved their herds from destruction. This remarkable treatment has been used for years in the big dairy country Sweden, and has cleaned up whole districts over there literally rotting with abortion. Frank Halfman, Crown Point, Ind., writes: "Two years ago, I lost every calf from my herd of forty cows. All remedies failed until I used yours. I have never lost a calf once."

C. C. C. (Cow, Calf, Control) is guaranteed to absolutely stop abortion or the treatment cost is refunded. Write today for full details explaining our free trial offer.

Simply send your name and address without further obligation on your part to Froberg Remedy Co., 16 Lincoln St., Valparaiso, Ind.

Penn State Dairy Show

THE Penn State Chapter of the American Dairy Science Association, which includes students enrolled in the dairy husbandry course at the Pennsylvania State College, will stage its annual Dairy Exposition on May 1st. A number of contests will be held according to the club president, A. M. Bready, in which both manufacturing and production students are showing a lively interest.

As a result of the support of the state dairy breed associations and the breed publications a number of prizes consisting of gold medals, subscriptions to breed papers and cash awards will be given to the winners in the various contests, which include a clean milk production contest, the judging of dairy products, the fitting and showing of dairy cattle, the judging of dairy cattle.

Plans Being Worked Out

Members of the dairy husbandry judging teams which competed at the 1925 National Dairy Show, under the supervision of a committee including J. S. Bryan, Perkasie; W. R. Fiedler, Scranton, and C. G. Gifford, Evans City, are working out plans for the events to be scheduled.

One of the most attractive features of the day's program will be the banquet in the evening at which the prizes will be awarded to the winners of the various contests. A number of men prominent in the dairy industry have already accepted an invitation to be present for the occasion.—A. L. B.

T. B. Eradication

THE tuberculosis eradication work during the first two months of 1926 has made progress at the same rate as during the record year of 1925. While heavy snows slowed up the work in a few counties, all the herds in twenty-eight townships, in ten counties, were tested on the area basis, according to the Pennsylvania Department of Agriculture. These include Chester, 4; York, 4; Lancaster, 1; Erie, 1; Tioga, 2; Greene, 1; Bradford, 1; Huntingdon, 11; Franklin, 1; Mifflin, 2.

During March work will be in progress in fourteen townships in six different counties, including Erie, 3; Forest, 3; Susquehanna, 3; Wayne, 1; Wyoming, 1; Somerset, 3.

Bring Summer Feeding into Your Winter Barn!

Blustery, cold days with the thermometer *way down* and feed prices *way up!* NOW is the time to buy a Unadilla and prepare against such a costly combination. The Unadilla makes and keeps a good, green, succulent, palatable silage that will take the place of grass—and put *profit* into your milk pail.

Its air-tight, frost repellant, storm-defying construction will keep your silage good to the last forkful.

No sticking or freezing of doors. The continuous opening at the level of the silage saves heavy, tiresome pitching. Simply *push* the silage out.

Write today for interesting Unadilla Catalog and learn the exclusive Unadilla features.

Our water tubs, storage tanks and vats are sturdily built and attractively priced.

Early cash orders subject to liberal discounts.

2 HOURS EXTRA When you have a De Laval Milker

IN a recent questionnaire received from 1160 De Laval Milker users in 47 states, this question was asked: "What saving in time and labor have you accomplished with the De Laval Milker?"

34.6 % said it saves 2.1 hours per day.
25.7 % said it saves entire time of one man.
14.3 % said it saves 50% in the time and labor of milking.
9.1 % said it saves entire time of two men.
1.2 % said it saves entire time of three men.
.94% [or only 11 out of a total of 1160] said it saves no time, and four of these eleven said it takes longer than by hand milking.

Why the "boot with the muscles" —gives extra wear

IT ISN'T heaviness that makes the powerful worker or the winning athlete — it's *muscular strength.* And it's the "muscles" of tough, live rubber that give to Top Notch Buddy Boots extra strength without adding weight.

These ribs or muscles are patented—an exclusive feature of Top Notch Buddy Boots. They protect the sides of the boot, strengthen them and prevent cracking.

The soles and heels are double-thick. The rubber-strip reinforcement next to the sole fortifies another vital point of wear. The trim-shaped leg prevents the foot from sliding up and down.

All materials that go into Top Notch Buddy Boots have special qualities for elasticity and toughness. We make each pair by hand from start to finish. The result is a boot of wonderful durability.

Rubber footwear for all the family

BOOTS, arctics, heavy and light rubbers—all styles and sizes for men, women and children. Made with unusual care to safeguard our 25 years' record for building distinctive, durable rubber footwear. Ask for Top Notch by name and look for the Top Notch Cross.

The best stores carry Top Notch Rubber Footwear or will get it at your request.

Alfalfa Hay for Sows

I have a number of brood sows that are due to farrow the latter part of March. I have been feeding them ear corn and a small amount of wheat middlings. I have been told that these sows might be fed some alfalfa hay to advantage. I have a good quality of hay on the farm. How can it be fed?—J. R. O., Chester County, Pa.

Ear corn and wheat middlings do not make the most satisfactory ration for brood sows. It can be very much improved by allowing the brood sows free access to alfalfa hay. The feeding of alfalfa hay will increase the amount of protein which the sows will receive. This is quite essential, especially during the latter part of the gestation period. The alfalfa hay should be placed in a rack in the yard where the sows can eat as much as they care for. They will probably eat the leaves and the fine stems, leaving the coarse stems. The racks should be refilled with fresh alfalfa whenever the supply becomes low.

The feeding of alfalfa hay will not only supply the necessary protein, but being a bulky feed will keep the digestive system of the sows in good condition. By placing the alfalfa hay in racks in the yard some distance from the sleeping quarters and feeding place they will be compelled to take exercise which is very essential for brood sows that are due to farrow in the spring.—W. H. Tomhave.

Livestock Price Trend

A DEFINITELY upward trend in prices of purebred livestock during the past year compared with the three preceding years is reported by the United States Department of Agriculture, as shown in preliminary tabulations of a nation-wide survey.

Reports on sale prices of purebred livestock have been obtained from approximately 15,000 breeders in all parts of the country. Detailed results of the survey will be released by the Department as rapidly as completed.

Separate reports will be issued on each of five breeds of hogs, three breeds of beef cattle, four breeds of dairy cattle, two breeds of dual-purpose cattle, and two breeds of sheep. Summary reports will cover cattle, hogs, and sheep.

Both the summary reports and the individual breed reports will be segregated on the basis of sex and age and will show average prices for each group. The reports will include both private and auction sales with separate totals and prices for each.

The Motor Truck a Factor

(Continued from page 3)

damp weather caused a very severe epidemic of late blight and rot. By the middle of September potato vines were either wholly or partly dead over most of the state. Growers knew the great danger of rot following late blight and were anxious to sell.

At the same time the exhaustion of the crops of the southern states and New Jersey forced the 4,000,000 of consumers in the great cities and many villages of up-state New York to turn to local supplies. Many growers were anxious to sell because of the danger of loss by rot if they stored; others were oppressed by debts from five hard years since the depression struck farm products in 1920. Prices were high and steadily rising, with the city and village markets without their usual supply from the south and ready to buy locally if they could. The second early crop states from New Jersey thru to Kansas were many thousand cars short of other years. The many manufacturing cities in New England, New York, Pennsylvania and the Middle West which were located in or near potato producing sections began to buy by means of trucks.

Northern Sections Ship Earlier

Those cities farther away from producing sections began to call on the northern tier of main crop states from Maine to Washington for their supplies at this time. These far northern sections began shipping weeks ahead of their normal dates, and cut heavily into their winter and spring stocks to fill the premature demand upon them.

The truckman filled the need of the hour for many cities. Potatoes too green and soft to bear the handling by rail could be loaded on a truck and delivered at the grocer's or the restaurant fit to use. By the last of September prices had begun to rise and kept rising thru October and into November. The truckman often made a handsome profit in the rise from the time he bought one week until the time he delivered the next. Farmers half way between Buffalo and Rochester, eighty miles apart, saw the trucks from each pass on the way to get potatoes. Trucks from Syracuse and Utica met the trucks going out from Binghamton. From Buffalo trucks went even as far as Potter County, Pennsylvania, over 100 miles away.

Steady Increase in Use

Ever since trucks have been invented there has been a steady increase in their use in marketing potatoes. We must expect that truck marketing will continue in the future, tho possibly it may fall off in 1926 with the probability of lower prices. The motor truck, if of any size, is a large investment and the cost per mile for interest, repairs, depreciation, tires, gas and oil is heavy. If the driver is a good driver, well paid, he is expensive. The cheap driver costs even more in operating costs. Insurance is a heavy item. Every mile traveled represents a considerable cost which must be paid by the load. Mile for mile and ton for ton the truck costs far more than the cost by railroad.

But the railroad freight is only one out of a number of costs between the farm and the city buyer. These are: (1) The farmer's cost of hauling his potatoes to the shipping station, in many cases ten miles or more. (2) The country shipper's cost of doing business, often with a warehouse and hired labor, buying from several growers before he has a car filled, perhaps with heavy railroad demurrage mounting up to $10 per car per day. (3) The railroad freight. (4) The city receiver, usually with a warehouse and heavy bills for rent and labor. (5) The trucking cost from the city receiver to the grocer, hotel or restaurant. (6) Bulk shipment of potatoes is being rapidly replaced by sack shipment; 150 pound sacks now cost about seventeen cents each and must be sold to the junkman for two cents at the other end. The truckman saves this cost by having his own sacks. The question of how far and how often the truck can market potatoes depends in any case on whether its one charge can be made cheaper than the sum of the five or six charges for railroad marketing.

Truck Here to Stay

The truck is here to stay. Even if potatoes should sell much lower next fall, a trade has been built up, city buyers have been educated to some of the advantages of truck marketing, and many truckmen have learned how to handle the business. Probably such long runs as were possible this year will not pay next, but as the trucking business is better developed its cost will be cut and its advantages developed.

It will be highly interesting to see how many growers will market in cities by truck next year. The grower is at an obvious disadvantage. The small and handy knockabout truck, so much used to haul milk to the creamery and for the many errands for the farm is too small to carry a heavy load over any distance cheaply. The driver costs as much for a forty-bushel load as for one twice as large. If a big truck is used only part of the time it is "eating its head off" with depreciation and interest charges.

Then, too, the grocer, hotel or restaurant prefers to buy where regular supplies can be depended on for the whole main crop season. If the grower is working on a large scale he will often prefer to sell in large quantities over a short period of time. If he sizes up the large crop to mean a failing market, he sells heavily in fall, and if he sizes up a short crop for a rising market he holds for higher prices. In either case he cannot supply the market regularly as well as the truckman who buys from many growers.

In many cases the truck buyer has a big advantage over the shipper by railroad. The latter is mixing together in each car the stock from a dozen growers. If even one has some rot, some frost, some scab, some undersized stock or some overgrown hollow stuff, that one load sets the price the shipper can get from city buyers. It is the hardest lesson for the grower to learn, but it is a cold and hard fact.

Quality Must Be Uniform

California and Washington ship their oranges, their eggs and their apples all over the United States at high prices. Every grocer has learned to know that he can expect uniformly high grade stuff, whether oranges, eggs or apples. As good business men, grocers are willing to pay hard cash for the privilege of dropping all worry about the quality of what they buy.

The country potato shipper by railroad cannot furnish this certainty. There is too much variation in the potato crops raised by different growers, and at most stations it is hard to separate the good and the poor.

The truck buyer can. He can go to twenty cellars, inspect the stock and buy only the best half dozen crops, those which will be uniformly high grade according to the standards of the highest class trade. Once he knows who these growers are, he can well afford to pay them a good premium above the car lot market for their stock, for he can get so much higher price himself. In this way the progressive and careful grower can get the premium for good potatoes he has so long deserved and found so hard to get in the past.

First Cost is Last Cost with Concrete

Twenty Sacks Will Do It!

—less than a ton of cement to take home, yet enough to build any of the following:

One hundred rot proof fence posts.

A sanitary feeding platform for sixty hogs.

One hundred and twenty feet of 24 by 4 in. concrete walk toward your barn.

A twenty-barrel watering tank with concrete platform around it.

A cooling tank for twenty cans of milk and a floor for the milk house.

Or any one of a dozen other expense proof improvements which will make your work easier and give you more profit from your farm.

Our free booklet "Permanent Repairs on the Farm" tells you how. Send for it today.

Does your house look a bit worn and shabby?

IF your farm house is beginning to have a discouraged, weather-beaten appearance, paint it this spring. Put on it an all-lead paint made of Dutch Boy pure white-lead and pure linseed oil.

A weather-worn surface may hide the beginning of decay. This all-lead paint, which has the weather-resisting qualities of the metal, saves the covered surface from the ravages of the weather.

It gives farm buildings the necessary protection to preserve them for years to come. Use it to keep buildings fresh and clean and thereby increase the permanent value of your entire property.

You can get this complete protection at a remarkably reasonable cost. Only 100 pounds of Dutch Boy white-lead are required to make seven gallons of pure lead paint, giving a tough, durable, elastic, waterproof coating that does not crack or scale.

"Decorating the Home" is a new free booklet illustrated in color which suggests decorative treatments for exteriors and interiors. It will be sent you, along with a booklet which gives complete directions for painting wood, plaster, metal and masonry, if you write to our nearest branch.

NATIONAL LEAD COMPANY
New York, 111 Broadway; Boston, 131 State Street; Buffalo, 116 Oak Street; Chicago, 900 West 18th Street; Cincinnati, 659 Freeman Avenue; Cleveland, 820 W. Co., 437 Chestnut Street.

The Dutch Boy trademark on every keg of Dutch Boy white-lead guarantees your getting lead paint of the highest quality. In addition to white-lead, there are also made under this trademark red-lead, solder, babbitt metals, and flatting oil for use with white-lead in painting interiors.

Dutch Boy White-Lead
Makes an All-lead Paint

"On 15 acres of corn, I lost but 3 or 4 hills"—

writes A. B. Wilmot, of E. Thetford, Vt. And it cost Mr. Wilmot only about $3.00 to save from 1-4 to 1-3 of his entire crop. Previously, the crows and other pests had fairly picnicked on his corn-fields. Hill after hill was entirely pulled up. Hill after hill he had to replant every season. This cost him not only money but it cost him a lot of his valuable time right at planting time. Then someone told him of a way to coat his seed corn in a mixture that no crows or any other pests would touch, after they once had a taste of it. This corn-saver was

Stanley's Crow Repellent

Mr. Wilmot sent for some. He mixed it with his seed corn. He did not have to wait for it to dry, but planted it at once. And it did not clog the planter. It did not injure the seed corn. It was not poisonous, for it would not kill birds or animals. But it did keep every crow, mole, squirrel and other pest off of his corn-field, after they got the first whiff of it. Now there are no more scare-crows in Mr. Wilmot's field. There's no more worry over not getting a full crop, so far as pests are concerned. And Mr. Wilmot is only one of hundreds who have written us that they would never plant a hill of corn again without coating their seed corn with Stanley's Crow Repellent. "Money Back" guarantee. Large can, enough for 2 bu. of seed corn (8 to 10 acres), $1.50. Half size, $1.00. If your hardware, drug or seed store doesn't have it in stock, order direct. Address, Cedar Hill Formulae Co., Box 500R, New Britain, Conn.

No. I'm not dead, but what is that stuff.
Let's get him out of this quick.

A Lesson in Raffia Work for Basket Enthusiasts

DEAR EDITOR:—May we have a raffia basket of some sort on our Home Page? Perhaps you could give us a nice sewing basket lesson.—Kathryn Gould, Pa.

* * *

DEAR EDITOR:—I enjoy making baskets with raffia, and I have often wondered why our Home Page never gives us raffia baskets. Will you some time print a way to speed up on working a raffia basket? I will appreciate it so much, and will be grateful for any new ideas in raffia.—Esther Hay, Pa.

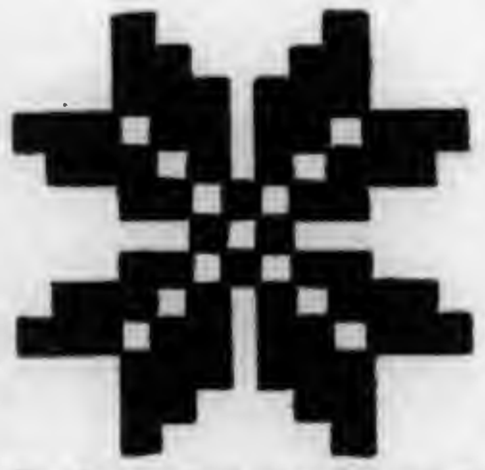
* * *

We shall aim to answer both these requests in one article, and perhaps to interest many new basket enthusiasts. Wouldn't it be exciting to fashion a basket in close imitation of one which won a blue ribbon prize at the Pan-American Exposition a few years ago? This is your opportunity, and it happens to be a sewing basket. It will work up reasonably fast, too, for we use large reed in the foundation.

Speed Depends Upon Materials

One word about quicker work. Rapid growth of the basket depends not so much on nimble fingers, as on the size of your building materials. One of the most charming baskets I have ever seen was raffia worked on rope, rope just like your wash-line. I have seen Indians making rope of long grasses for some of their prettiest creations. They often use willow, too.

There are four stitches commonly used: Lazy Squaw, Chain Stitch, Knot Stitch and Figure Eight. In Lazy Squaw you make a long stitch covering two reed rows, then wrap once, then another long stitch, then another wrap, and so continue, working always with the reed circling under the management of the left hand.



The design which is worked out on the sewing basket described in the accompanying article.

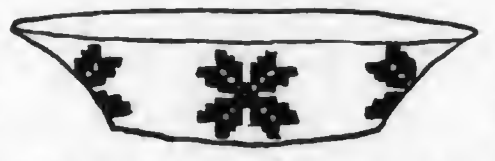
Chain Stitch is exactly like Lazy Squaw with this modification; instead of wrapping just once, you wrap enough to make the long stitches in line with each other. Split each long stitch by bringing your needle up thru the very center of the previous long stitch (that is the previous row).

Knot Stitch, too, has Lazy Squaw for its foundation, this variety being made by a sort of tie made with each long stitch. Just as you come up with a long stitch, bring your needle thru and lap over the long stitch.

Figure Eight is made like a figure eight. Think of it as a real "8" with reed passing thru both sections of the figure, your stitch coming up and then under, each row of reed standing out smoothly.

If you are a beginner and these instructions seem vague, I will gladly mail you a tiny sample demonstrating whichever stitch puzzles you. Kindly send a self-addressed stamped envelope with your request.

The prize basket pictured has a base five inches in diameter worked on No. 4 round reed. Select a smooth perfect strand, and with a sharp knife prepare one end by shaving four inches of it down to a gently tapering point. Soak in warm water. Select a narrow strand of natural color raffia, and while working keep it soft and moist by drawing it across a damp sponge or cloth. Thread raffia, fine end, in a blunt tapestry needle, and if your reed has become pliable, wrap that tapering end with raffia, far enough to bend it into a small circle. Continue circling 'round this tiny beginning, fastening rows of reed with the knot stitch. (This is to follow the sample; use other stitches if you prefer.) The entire base is made of natural color raffia, and it grows row after row as you keep stitching and turning.



The prize basket when completed

Keep measuring as you work and as soon as your base diameter approaches four and one-half inches we will make the final round with No. 6 round reed, the same to be used in the basket sides. Join this No. 6 to the No. 4 by carefully cutting the ends to a tapering shave, then hold firm, making a lap or splice of about two inches. Now start shaping upward, each row out a trifle farther than the preceding one. Work on the outside of the basket with the reed turned away from you and held in the left hand.

Now for the Design

Make three rounds of plain natural color, then introduce the design as pictured, four of those symbols being worked as you build. The contrasting color is rich golden brown. It is wise to use four needles now and keep one threaded for each design. In shaping it is a good idea to cut a piece of cardboard to set in the basket occasionally and judge how nearly you are approaching your ideal, your model. For this basket your cardboard should measure five inches across the bottom, ten and one-half inches across the top, and three and one-half inches high.

Now study the design for a moment. Mark your basket in fourths, to properly place the figures. Start the design on the fourth round by making just the two stitches of color with five stitches of natural separating them. On the next round, four colored stitches for each figure, placed as in the sketch. And so on carefully copying the design as pictured.

Two more rounds of work in natural color raffia, and we are ready to finish. Shave off one inch at the end of your work (which should fall above where you started the round leaving the bottom and beginning the sides) until it is nearly nothing. Stitch along this tiny strip until it is all covered. You will need about a yard of heavy handle reed No. 9, to make the finishing round. Soak this reed all night, and start working about two inches from the end. Use the golden brown raffia, and the same stitch used thruout, in joining this round to the basket. When finished this must be one perfect round, so great care is necessary in making the joint.

As soon as you can measure accurately where to cut the ends, prepare them as follows: cut one-half of each end away lengthwise, so that one will provide the upper half of the two-inch joint, while the other end furnishes the lower half.

Success and happiness be yours, for if you carry out these directions you have copied a beautiful basket made in the Philippine Islands, where basketry is an art. If you strike any snags, write me freely. If you are puzzled as to supplies, I will help anyone sending a self-addressed stamped envelope to Home Page Editor, Pennsylvania Farmer, 261 S. Third St., Phila., Pa.—Gertrude S. Stewart.

Shining Lights

DO NOT neglect your windows these March days, when you need the cheer and inspiration of shining glass. The task is not so laborious if your equipment is good. I prefer clean cloths and lots of soapy water, and the cloths must be of white percale, and hemmed, to shy clear of lint. An ice pick, nut pick, or even a hairpin will help remove dust from the corners.

Recently I was helping a neighbor wash windows and they did not clear up at all, so I hastened home and brought my own clean cloths and was soon proud of the quick and satisfying results.

While evenings wax long, are your lamps all trimmed and glistening? Use the same kind of clean hemmed cloths, and with suds aplenty, make quick work of this daily chore. And let's not forget the lanterns, too!—Claribel Maye, N. Y.

Bread Pudding

PLACE a slice of buttered bread in the pudding pan, sprinkle with sugar, a bit of nutmeg, and a handful of raisins. Add another layer like it, and so continue until your pan is full. Cover with sweet milk and bake in a slow oven.—Lake-Wolverton, N. J.

Editor's Note: This pudding is much improved by adding a pinch of salt, and a well beaten egg to the milk before pouring it over the bread.

Prize Winning Hints

WHEN I make my gingham aprons, I fell the seams neatly, and instead of hemming I face the edges with a pretty contrasting color. I make a pocket on one side using the original goods, and one on the other side matching the facing. Thus I have an apron with neither right nor wrong sides, but two sides. The same idea can be used with unbleached muslin and other materials.

My embroidered sheets and pillow cases became too worn for use, yet the hand-embroidered monograms were still good. I cut the monograms out in a circle and used them again by neatly featherstitching them on new material.—Jessie M. Keeley, Pa.

Do You Like "Gooey"?

A BOY came home from a school cafeteria and said he could not eat the things they served because everything had "gooey" on it. Being a boy he could not explain the looks or the composition of gooey, but it was something served with meat, baked apples, pudding, potatoes, slaw, tomatoes and many other foods.

His mother investigated the case and found that the meat loaf was served with a mixture of tomato thickened with chopped onion, carrot and various other vegetables cooked together. The baked apples had a thickening of flour, water, butter and sugar poured over them. The domestic science class that managed the cafeteria was strong on sauces, dressings and additions that did not suit the sturdy boys but the girls of the class reveled in salads topped with dressings, apples mixed with sugar and nuts with a sprinkling of cocoanut, or perhaps a bit of whipped cream.

Not Only in Class Rooms

Of course, cooking of this kind is not confined to the class learning to make dressings and sauces. One meets it everywhere these days. A plain baked apple in some homes is a rarity.

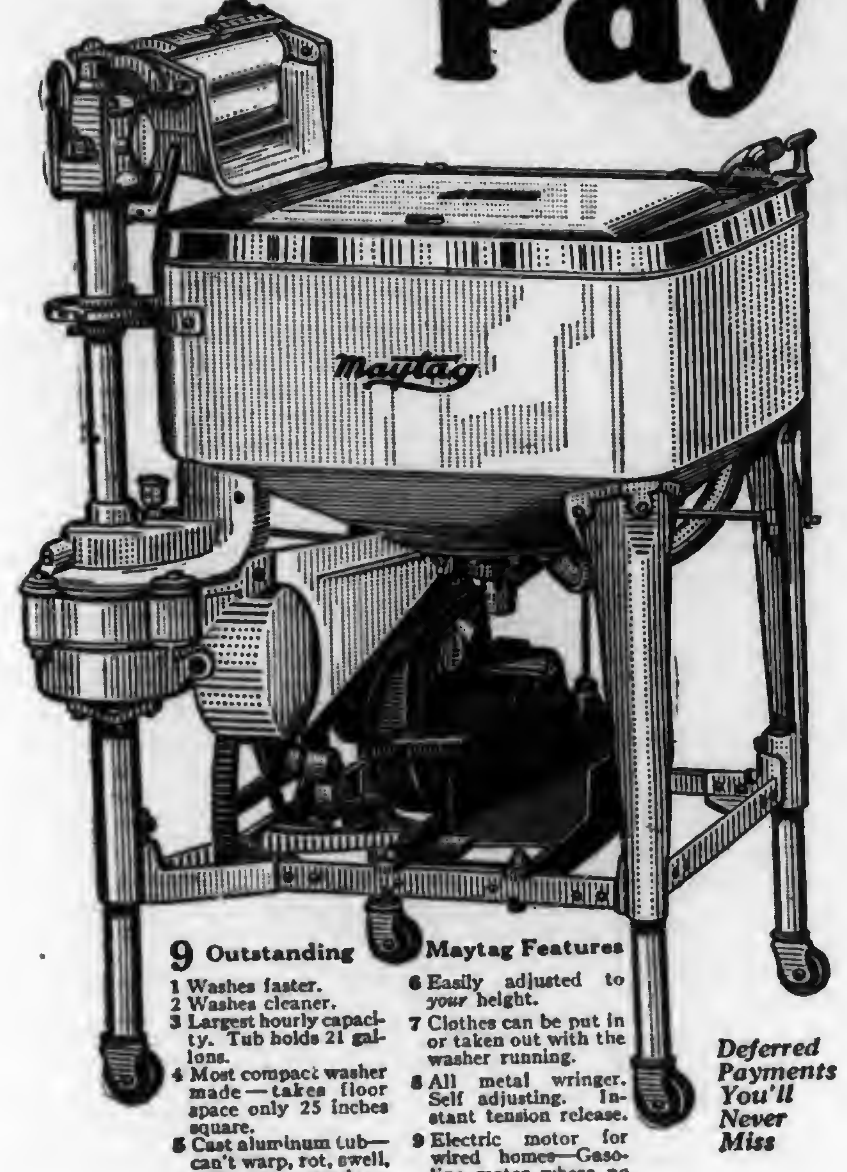
Is the country losing the taste for simple cookery? When one reads the names on bills of fare and sees what one gets in ordering it would seem to indicate that at present the popular demand is for mystifying dishes. Good old roast beef with simple gravy, plain bread without nuts or raisins or spice, mashed potato, plain vegetables and fruit in the natural state still look good to us, but we don't want to be known as hopelessly old fashioned. How is it? Are these mixtures good for the health? Are they worth spending hours getting them ready? Do you like "gooey"?—Hilda Richmond, Ohio.

An Afternoon Indoors

POSSIBLY nothing thrills a child's imagination as does some sort of a boat. A kindergarten teacher who was recently a guest in our home had a novel idea that has amused the children many times. She used egg shells and English walnut shells for making the fleet of boats that sailed in our bath tub for several days.

The end of a candle was melted and this tallow was poured, while hot, into the shells. Immediately into this hot tallow she stuck a tooth pick to which a sail made of a bright colored piece of silk or colored paper had been fastened.

The children can easily make these boats and sails themselves. If there are two children one may have a fleet of egg shell boats and the other the walnut shell boats. Each one may have his own color of sails.—May H. Mumaw.



Pay no money

till you WASH WITH IT

Ask any Maytag dealer to send you without cost or obligation, a Maytag Aluminum Multi-Motor Washer. Then gather the biggest washing you can find, and watch the Maytag wash a big tub of clothes in 3 to 7 minutes. Test it on everything—fine silks, laces and linen, on rag rugs, blankets, on grimy, greasy overalls and work-clothes. The new and different gyrafoam action of the Maytag washes them all clean, even collars, cuffs and wristbands, without hand-rubbing.

In-Built Gasoline Multi-Motor or Electric Motor

The In-Built Gasoline Maytag Multi-Motor is a powerful, smooth-running, dependable gasoline engine. Starts with a turn of the foot lever and does a big farm washing with a few cents worth of gasoline.

For homes with electricity, the Maytag is built with an electric motor

9 Outstanding Maytag Features

1 Washes faster.
2 Washes cleaner.
3 Largest hourly capacity. Tub holds 21 gallons.
4 Most compact washer made—takes floor space only 25 inches square.
5 Cast aluminum tub—can't warp, rot, swell, split nor corrode—cleans itself.
6 Easily adjusted to *your* height.
7 Clothes can be put in or taken out with the washer running.
8 All metal wringer. Self adjusting. Instant tension release.
9 Electric motor for wired homes—Gasoline motor where no electricity is available.

9 Reasons for World Leadership

Deferred Payments You'll Never Miss

FREE TRIAL for a Whole Week's Wash

In no other way can you fully appreciate the marvelous speed, the large capacity, the extreme handiness, simplicity and safety of the Maytag. You must actually use the all-metal, automatic-adjusting, instant tension-release wringer. You must see the cast-aluminum, self-cleaning tub that can't rust, rot, split, warp nor corrode. Observe *all* of the nine outstanding Maytag features. Arrange to do your next washing in a Maytag—no cost, no obligation.

Aluminum Washer

IF IT DOESN'T SELL ITSELF, DON'T KEEP IT

BOSS THERMO Electric and Gasoline Motor WASHERS

Bring City Service to Country Homes

The sensational success of the THERMO Electric Washer with its high temperature washing process has created a big demand from country homes for the new THERMO Gasoline Motor Washer. The same exclusive and highly efficient heat-retaining construction is used in this latest model. Ample power is supplied by a 4 cycle, silent, dependable gasoline motor built like an auto engine. So simple that a child can operate it. Costs only 3c per hour to run.

The Boss Washer line includes many different models in electric, gasoline motor, hand, water and belt power. These quality washers can be bought from your dealer at present low prices from $7.75 up. Only a few are shown in this ad. More than 1,000,000 in use.

For more than 36 years Boss Washers have eliminated the drudgery of wash day in thousands of homes. Many bought 20 years ago are still serving their original owners. Boss Washers are strongly made and wash beautifully. Unsurpassed for fast and thorough work. The THERMO models are the only insulated heat-retaining washers made. In coldest weather they keep the wash water hot throughout the biggest washing; and when sultry, summer makes washing by ordinary means a most disagreeable task, THERMO eliminates the hottest part—the boiling of clothes.

Guaranteed by the Pioneer washer manufacturers—makers since 1889 of the well-known and time-tried Boss Washers. If your dealer does not have them we will ship you direct.

FREE booklet upon request. Use the coupon today!

Coleman Quick-Lite Lamps and Lanterns
"The Sunshine of the Night"

1. Make and Burn Their Own Gas From Common Motor Gasoline.
2. Give 300 Candle Power of Brilliant Pure White Light. No Glare—No Flicker.
3. More Light Than 20 Old Style Oil Lamps or Lanterns.
4. Light With Common Matches—No Torch Needed.
5. No Wicks to Trim or Chimneys to Wash.
6. Can't Spill or Explode Even if Tipped Over.
7. Cost to Use Less Than 5c a Month.
8. Solidly Built of Heavily Nickeled Brass. Will Last a Life Time.
9. Lamp is Handsomely Designed — Equipped With Universal Shade Holder.
10. Lantern Has Mica Globe With Reflector—Can't Blow Out in Any Wind. Rain-Proof, Bug-Proof.
11. Sold by More Than 30,000 Dealers. If yours can't supply you write nearest factory branch. Address Dept. PA-21

The Arnold Plan
FOR STEADY INCOME

When you have invested your savings or surplus funds in Arnold 6½% First Mortgage Certificates, you may feel assured that you have exercised the highest degree of caution and may therefore be free from worry.

Every Arnold Certificate has back of it a number of First Mortgages held by the Merchants Bank & Trust Company of Washington, which acts as Trustee.

Arnold Certificates are further guaranteed as to both interest and principal by the issuing Company with Capital and Surplus of $1,250,000.

Issued in amounts of $100, $500 and $1,000, to run two to ten years. May be purchased direct without commission or brokerage charge. Monthly payments if desired.

FIRST MORTGAGE COLLATERAL 6% GOLD BONDS GUARANTEED BY THE NATIONAL SURETY CO. EMPIRE TRUST COMPANY, TRUSTEE

In addition to Arnold Guaranteed Certificates we now offer investors highly desirable First Mortgage Collateral 6% Gold Bonds as issued by the Federal Home Mortgage Co., and guaranteed as to both principal and interest by the National Surety Co., the world's largest surety company. Coupon form denominations $100, $500 and $1,000; maturities five to fifteen years. Price $100 to yield 6%.

Write today for Booklet No. 14

Thrift in the Linen Closet

A Pet Economy of Mine—Saving for Emergencies

ONE of my most motherly friends is of Swiss descent, and she has taught me so many housekeeping economies. One day we were reading a Home Page article on winter industries involving the using of old sheets. She then said, "Well, I have been in my own home for over thirty years, with at least three beds in constant use. Today I consider every sheet I have ever had very, very useful." This is her idea, and it has already served me well on several occasions.

Never entirely wear out a sheet. When your sheets begin to grow thin, use them only occasionally, and you will be spared many times either sudden expense or embarassment, perhaps both. Keep these worn sheets for the emergencies. Those days come to us all, when in August, one relay of guests follows another in rapid succession. Laundry work piles up when there are so many duties and pleasures all at once.

If There Is Sickness

Sometimes there is sickness in the house, then how fortunate you are if the supply of bed linen is not so limited. The sick bed should be freshened daily, which requires an unusual supply. Consider then, is it not wiser to lay aside the soft thin sheets for just such occasions, rather than wear them to the finish, winding them up in carpet rags or even into bands for sterilizing? One should certainly have jars of sterile bands on the shelf but the prepared ones cost far less than a sheet.

I have carried this pet economy even farther, and I fairly treasure soft old night garments, pillow cases, towels, and table linen. There are times when many careful housewives would give up some precious gem, if they had just one more clean tablecloth that moment. Why wear them entirely out? When their race is nearly run, put them in dust-proof cases and save for the emergency.—Gertrude S. Stewart, N. J.

Lovely Easter Baskets

EASTER baskets that are charming as gifts or for decorations are made from halves of egg shells. Two or three weeks before Easter, when the weekly baking is done, select eggs having pure white shells; be sure they are perfectly clean and cut them around the center, each half forming a cup. It is necessary to make the edges perfectly smooth instead of leaving them ragged and rough.

Out of a silkateen thread in lilac, crocus yellow or pale green, crochet a star-shaped net in long chain stitched loops to fit over the bottom and a quarter way up the sides of the shell. To each of the five corners attach a loop bringing the loops together at a point well above the basket and fasten them to a ring to be used if the Easter basket is to be suspended from a gas jet or curtain rod.

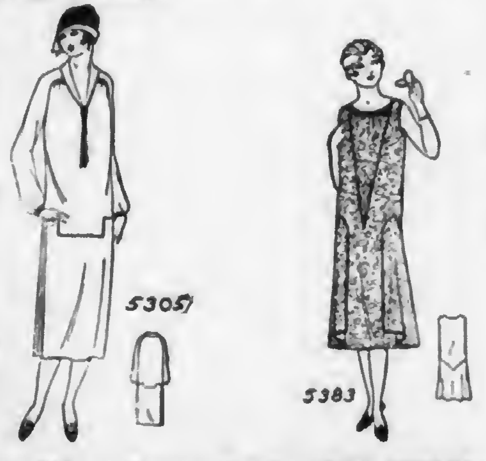
A week before Easter fill the egg basket with cotton batting (do not press it in tightly) moisten it well with warm water and in it sow a small teaspoonful of rape, flax or radish seed. Hang the basket where it will be warm and in the sunshine the greater part of the day and every twenty-four hours moisten the cotton lightly with a fine spray.

At Easter time there will be a beautiful crop of green in and around the edge of the egg shell.—Lalja M. Thornton, N. Y.

We All Want Something New

Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

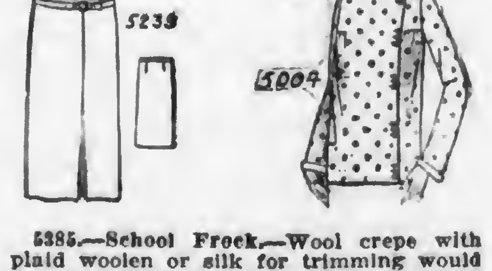
5305.—A Popular Model.—This is a good style for jersey or balbriggan, faille or wool rep. The shoulder portions are made in one with the sleeve. Seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size requires 3⅝ yards of 54-inch material. The width at the foot with plaits extended is 2½ yards. Pattern, 10 cents.



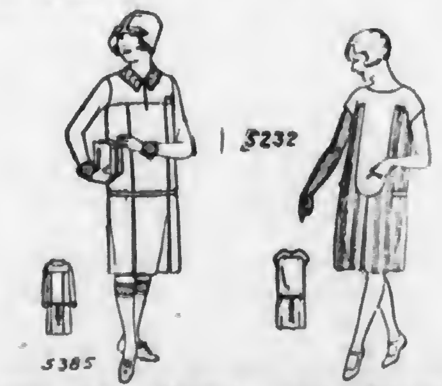
5383.—A Pretty Frock.—Metal brocade, lace, chiffon or taffeta could be used for this attractive style. It will also be pleasing in combinations of two materials. Three sizes: 16, 18 and 20 years. A 16-year size requires 3⅞ yards of 40-inch material. The width of the skirt at the lower edge is 1⅜ yard. Pattern, 10 cents.

5239.—Sports Skirt.—Kasha, taffeta, balbriggan or linen could be used for this design. The back is dart fitted, and the front has the popular plait fulness at the center. Seven sizes: 25, 27, 29, 31, 33, 35 and 37 inches waist measure, with corresponding hip measure, 35, 37, 39, 41, 43, 45 and 47 inches. A 29-inch size requires 1½ yard of 54-inch material. The width at the foot with plaits extended is 1¾ yard. Pattern, 10 cents.

5004.—A Smart Blouse.—This model is especially adapted to slender figures. The collar may be omitted and the neck edge cut round. Six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size requires 2⅝ yards of 40-inch material, with ¼ yard for collar and sleeve facings. Pattern, 10 cents.



5385.—School Frock.—Wool crepe with plaid woolen or silk for trimming would be suitable for this style. It is also good for linen, tub silk or cotton broad cloth. Four sizes: 8, 10, 12 and 14 years. A 10-year size requires 2½ yards of 40-inch material with ¼ yard of contrasting material for collar and cuff facings. Pattern, 10 cents.



5232.—For Mother's Girl.—Striped broadcloth is combined with plain broadcloth in this instance. The model is good also for flannel, printed fabrics and jersey weaves. Four sizes: 6, 8, 10 and 12 years. A 10-year size requires 1⅞ yard of striped material and ⅝ yard of plain material 36 inches wide, if made as illustrated. Pattern, 10 cents.

Send 10c in silver or stamps for our up-to-date spring and summer 1926 Book of Fashions.

RADIO DEPARTMENT

Conducted by

BRAINARD FOOTE

Several Factors Affect Radio Reception

NO DOUBT you've heard claims made as to a set's power in reception. The set "reaches from coast to coast with ease," or is "able to tune in any broadcasting station in the country" and so forth. You should realize that any statement as to the ability of a set to receive far distant stations is greatly dependent upon its location and surroundings.

The finest radio set in the world can do nothing worth talking about if it's connected to an indoor aerial in a steel building. Of course, engineers have taken loop radio sets in tunnels under rivers and have demonstrated reception of a sort, but no real reception from any distant or weak stations is possible under such adverse conditions.

Manufacturers of the most reliable receiving apparatus are careful to avoid exaggerated claims. When they do give actual receiving results they are certain to state the location and conditions under which the test was conducted. When the reception obtained by some fortunate listener is used to prove the operation qualities of a set, the manufacturer is careful to give the location, type of aerial and other necessary data.

It Isn't Just the Set

Therefore, in gauging your own expectations of radio set performance, do not get the idea, unfortunately so common, that the distance you can cover and the ease with which you can tune from one station to another, is entirely controlled by the make or type of set you purchase or construct. Under identical conditions, it is possible to compare radio sets equitably.

To give you a better idea of the impossibility of comparing radio sets as to their distance powers, it might be pointed out that the United States Bureau of Standards has so far refrained from attempting any such thing as a "standard radio receiver" altho they have wanted one for years. In other lines, there is a standard of excellence by which other things may be compared—for instance—a standard pound weight, a standard foot measure, a standard variable radio condenser, a standard radio coil and so forth.

In picking out the new radio set or radio part, the buyer who is guided chiefly by the money-back guarantee of the set maker that he will secure all sorts of long distance reception is hardly as wise as the man who selects his set more on the basis of reputation of the concern, reports of reliable friends or other disinterested sources, or asks an actual trial of the set in his own home and on his own aerial.

Summary of Influential Factors

The factors which may affect the results obtained with a radio installation may be summed up as follows: 1. Location; 2. Aerial; 3. Kind of set; 4. Kind of accessories; 5. Manner of installation; 6. Skill of the operator.

It is quite difficult to attach major importance to any one or two of these items. The location considers the surrounding country. If there are lots of steel buildings, street wires, traction lines, other aerials, telephone wires and so on quite near the aerial and as high or higher than the aerial, the location must be considered poor. A comparatively high spot in suburb or country, free from these obstructions and trees, is a very good location. A one-tube set in a good location will often reach farther out than would a similar set, having two stages of radio frequency amplification besides, in the poor spot.

Must Have Good Aerial

The aerial must be as good as possible if one wants the utmost. This subject has been covered repeatedly. The type of equipment is, of course, of great importance. A set using dry cell tubes will usually not receive quite as far nor deliver the same amount of volume as a similar set with storage battery tubes. A simple set without radio frequency will bring in distance only in a fairly good location, and if situated in a city or near one having a great many stations, it will be difficult to separate them or tune selectively because there aren't enough tuned circuits in the set.

With one or two radio frequency stages the distance qualities improve for poor locations and become very great in good locations. However, an inefficient set having two stages of radio frequency amplification is often less effective than a better-built set of only one radio frequency stage. Indeed, many a five-tube receiver of the very low-priced class has been remodeled into a really good four-tube set, eliminating one tuning control and getting better results at the same time. Listeners and prospective ones have more or less gotten the idea that a set is all right if it's a "five-tube" set, no matter how low its price! —B. F.

Have You Questions?

RADIO listeners who have problems in the operation of their sets are invited to write this department, care of Pennsylvania Farmer, for assistance. The question and answer man doesn't have an easy job! Perhaps the favorite query runs something like this: "I bought a Pickodyne De Luxe Special Five but cannot seem to get any distance. I use good tubes. Can you advise me what to do?" Sounds funny, but it's no exaggeration. Might as well call the doctor on the 'phone and say, "I'm sick; what's the matter with me?" When you write, try to give a complete list of the ailments of the set. Describe it in detail, with names of parts and a diagram, if you made it yourself, and state just how it acts in every respect.

While on this subject, it is just as well to mention that the speediest answer comes to him who includes the stamped, self-addressed envelope, preferably of business size. —B. F.

Variable Grid Leak

Do you advise a variable grid leak?—H. L.

Not unless you do not have radio frequency amplification in your set and are attempting to get extremely long distances on a regenerative receiver.

A variable grid leak is especially helpful if you use the UV-200 or C-300 type of soft tube as the detector. This type of tube is slightly more sensitive than the 201A type, but does not reproduce quite so clearly and is not recommended highly where one has radio frequency amplification.—B. F.

NEW IDEA SPREADER
An Invention ~ Not an Imitation

"Balloon Tires"—for Smoother Running and Lighter Draft!

NEW IDEA leads again—in improving spreader construction. Our new models are all equipped with "Balloon Tires"—extra wide, easy-running wheels with continuous cleats. This latest improvement makes it easy to handle the spreader on soft ground without cutting up the soil—prevents "skidding"—and insures smoother running—lighter draft—and longer life.

You want the utmost in spreader quality. To be sure of getting it, insist on the genuine New Idea. See your dealer—or write for full information.

The New Idea Spreader Co.
Coldwater, Ohio

The largest independent spreader factory in the world—not in any trust or combination.

Covered by Original Patents. Widely Imitated—Never Equalled

(14)

For silent operation

QUALITY of performance depends very much on the tubes. And the silent operation of a tube depends very much on the filament.

Probably one of the greatest developments in radio was the X-L filament evolved for RCA Radiotrons. A tube that needs much heat—much current—for its operation, tends to be noisy. But a Radiotron UV-201-A or UV-199, with its X-L filament, needs little current and operates silently.

To be sure of the last word in research and in careful manufacture, for finest performance, be careful to get genuine RCA Radiotrons.

RADIOTRON UV-199 is the standard tube for dry battery sets.

RADIOTRON UX-199 is *exactly* like it, but has the new standard base.

OUR YOUNG PEOPLE'S FORUM!

From Forum Friends

Dear Cousin Ruth:—I have one sister. Her name is Ruth. She is married and has three children and lives about five miles from Trenton, N. J. We went to visit her and on our way down we stopped in Philadelphia and looked thru the Wanamaker store and were in the old State House, too. Then on our way home we stopped at the zoo in Philadelphia and saw all kinds of animals. We went by automobile and came by Camden, N. J., and crossed on the ferry boat to Philadelphia. I stood on the front of the boat and looked at the water.

We have lots of snow now. I like to go sledding. I take my sled and slide down the hills on my way to and from school.—Dorothy M. Watson, nine (X), Cumberland County, Pa.

Arthur, Wayne and Dora Habacker, Lancaster County, Pa.

Dear Cousin Ruth:—We like to watch the birds these snowy days. Their feeding place is just outside of one of our windows. We have as many as twelve red birds, sometimes, and lots of English sparrows and song sparrows, flickers, snow birds, one dove, one little wren, and one robin but we think it got too cold for the robin as he has gone and the little wren, too. There are three or four more different kinds of birds here that we do not know the name of.

We put out a basket of walnuts one morning and watched a red squirrel carry them away. He certainly was busy for an hour or so. He buried every one of them in the snow. — Naomi Myrtle Johnston, eleven (X), Washington County, Pa.

Dear Cousin Ruth and Forum Friends:—My daddy has a radio and we can get sixty stations. Cousin Ruth, do you have a radio? I think they are fine. The "Blue Ribbon Quartette" and the "Landay Revelers" are the best, I think. Did you ever hear them?—Grace Kern, ten, Lancaster County, Pa.

Dear Cousin Ruth and Forum Friends: — My daddy has a radio and my girl friend comes up almost every night with her parents to listen to it. Cousin Ruth, do you go sledding? I do, and I enjoy it very much. I do not go skating because I am not old enough. — Margaret Stroman, Lancaster County, Pa.

Dear Cousin Ruth:—We keep an inn here in Cedarville. It is called Brass Kettle Inn. Probably you have heard of it.

I am going skating this afternoon with some girl friends.—Mildred Quadling, eleven, Cumberland County, N. J.

Dear Cousin Ruth and Forum Friends:—I received a membership pin and am very proud of it. Don't be surprised if a lot from our school write.

We're having jolly times at school now sliding down the hill. It's right by the schoolhouse, and, Cousin Ruth, I believe you'd call me a reckless driver. There are several stumps where we ride. I believe I'd steer for the stumps but I haven't tried it yet. I wish you were here, you'd have the time of your life that you'd never forget. Our school went on a sleigh ride one or two weeks ago. We had lots of fun. I've been having a cold and have to stay home from school today.—Mildred M. Hartman, ten (X), Columbia County, Pa.

Dear Cousin Ruth and Forum Friends:—We had our cows tested for tuberculosis, but they all passed.

In the summertime I take music lessons. I also play the cornet. Cousin Ruth, can you play the piano, or any other musical instrument?

I go to Fawn Grove School. My teacher is my mother. I am in the eighth grade and I have seven classmates.

We have a dog. She is an Eskimo Spitz. Her name is Toots. She is white all over. We love her very much. She can do lots of tricks.—Mary Brown, (12), York County, Pa.

Junior Project Winners

Note: Last week stories of four vocational school project winners were printed. This week the other two silver medal winners will tell you about their interesting and successful projects.

COUSIN RUTH.

I AM nine years old and live on a farm one mile west of Carlisle. Last spring Mr. Park, our vocational supervisor, gave me four quarts of Lancaster County Sure Crop corn to plant. My father gave me a piece of ground to plant it on.

We first manured the ground the fall before then plowed early in the spring and cultivated well before we planted. After the corn was up we first harrowed, then cultivated the corn three times and kept the weeds pulled out. The average yield was 104 bushels to the acre.

LESTER SHUGHART

Grahams School, Cumberland County, Pa.

Last year I won the silver medal at Harrisburg and have won seven ribbons at different shows and I won the silver medal this year at Harrisburg. We picked the ten nicest ears for exhibition.

I have a pony, I call him Rocksie and he likes to eat the corn.—R. Lester Shughart, Grahams Vocational School, Cumberland County, Pa.

EARLY in the spring of 1925, as a result of project work started in Sturgeon School, my father and I had an understanding that I was to take full charge of the garden in which I took a real interest.

Our garden consists of one and one-half acres of land situated near Noblestown, South Fayette Township, Allegheny County, Pennsylvania. I began my work in the month of April by making a hot-bed for pepper and tomato plants, and by doing some spading for the things that should be planted early, such as lettuce, radishes and onions.

A little later, I had the remainder of the ground plowed. After that all work was done by hand, and then I kept on planting.

As soon as the plants appeared, the weeds were there, too. Then my real work began, because destroying weeds is the most essential thing in growing vegetables.

The bugs and worms also started work on the cabbage and cucumber plants, but they were killed by the use of powder.

From this time on everything went along fine. In the fall I entered some of my vegetables at the Sturgeon School exhibit and won a prize.

The most seeding was done in May and June, the most hoeing in the latter part of June and July, but I still continued hoeing in the month of August.

HERBERT KRESS,

Sturgeon School, Allegheny County, Pa.

My first tomatoes were ready for market on the sixth of August, and as they were the first to be offered for sale in the neighborhood, I had no trouble in disposing of them at a nearby grocery store, which gladly bought all of my products as they were "A No. 1."

On January 28, 1926, Mr. John F. Howe, county supervisor of the agricultural department of the Allegheny County schools, came to our school and presented me with a beautiful medal as winner of the junior truck contest.

This was indeed a great surprise to me, as even my teacher, Mrs. Julia Birmingham, did not know such a prize was offered. I had not worked with a prize in view, but with the idea of carrying out a definite project.

My success has been very pleasing to my parents and friends, but much more gratifying to me is the feeling that I have done something really worth while—that I stuck to my job until finished.

I have been doing this sort of work ever since I could lift a hoe, and find it a source of real pleasure. I have been benefited both mentally and physically, besides making a clear profit of $279.51.

Last, but not least, the lessons of patience and perseverance I have learned will enable me to do better gardening in the near future.—Herbert Kress, Sturgeon Vocational School, Allegheny County, Pa.

OUR LITTLE FOLKS' PUZZLE CORNER

DEAR LITTLE FOLKS:—Probably we're all more or less alike and when the longer days make us know that spring is at hand we begin to think about some of the many beautiful and interesting things there are in this world that we should like to see. If you ever do get to see much of this old world you'll need to know something about the word of nine leters in this week's puzzle. The way to find the long word is to try out the shorter words which are defined below and fill in the letters in the spaces above the corresponding numbers. For instance, I know you all know "what a hen lays," so you might begin by putting "E" in the space above "2," "G" above "1" and "G" above "4." I mustn't tell you any more for that would spoil your fun in finding the word you will need to know when you start out to see the world. When you have the letters which spell this word, send the answer to me on a POSTCARD so that it reaches me by March 20th. BE SURE TO SAY HOW OLD YOU ARE. The ten children sending in the correct answer, whose cards are the best in grammar, spelling, punctuation, penmanship and general appearance will each be awarded a set of pictures.

The Honor Prizes, bright and shiny pencils with a supply of leads, go to those Little Folks who send in correct, excellent answers to ten puzzles for ten straight weeks without missing,—one each week. Please remember that in order to win an Honor Prize your answers must be absolutely correct each week. Mistakes in spelling, punctuation, and failure to mention your age every time are only a few of the many errors that are made weekly.

Address all replies to the PUZZLE EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

The answer to the puzzle published in the February 20 issue of Pennsylvania Farmer is: GEORGE WASHINGTON.

The puzzle prize winners are: Hannah Braxton, age 11, Trenton, N. J.; Eva Bubb, age 11, Bastress, Pa.; Olive Belle Cronk, age 10, Stevensville, Pa.; Geraldine Hall, age 10, Wellsboro, Pa.; Warren R. Hammer, age 10, Reynolds Dale, Pa.; J. Stewart Heller, age 10, Aspers, Pa.; Harry Kelso, age 8, Newville, Pa.; Geneva Manges, age 10, Reynolds Dale, Pa.; Marie K. Stern, age 8, Elizabethtown, Pa.; S. Lon Weidner, age 12, Gardners, Pa.

What a hen lays (2, 1, 4)
A rabbit (8, 6, 5, 2)
A kind of fruit (7, 2, 6, 5)
First name of a famous President of the U. S. (4, 2, 3, 5, 1, 2)
Has twelve months (9, 2, 6, 5)
A quiet color (4, 5, 6, 9)
A brave man (8, 2, 5, 3)
Grows in the vineyard (1, 5, 6, 7, 2)
A swine (8, 3, 1)
Heavy cord (5, 3, 7, 2)
A musical instrument (8, 6, 5, 7)

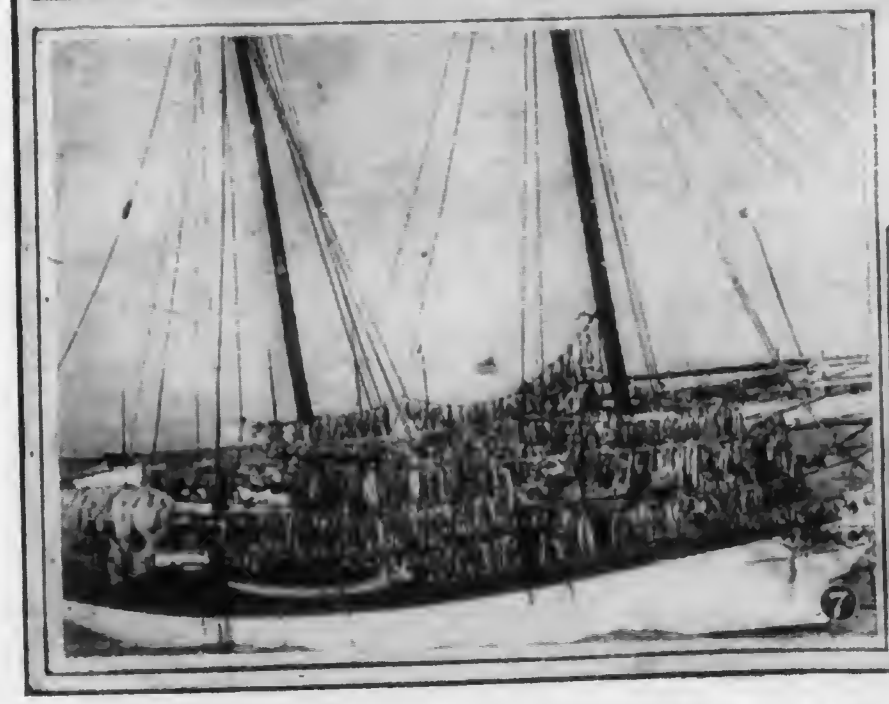
PASSING EVENTS IN PICTURES



(Copyright by Underwood & Underwood)

1.—In this house in Chicago, Eugene Field, the beloved children's poet, died in 1895. Recently it was torn down and relics of the poet's past scattered far and wide.

2.—This novel toy band consists of Massachusetts settlement children, who play nothing but classical music on their five and ten cent instruments which include drums, tambourines, triangles, etc.

3.—One of America's foremost riding families was among the exhibitors at this winter's Los Angeles Horse Show.

4.—Nearly one hundred were killed or injured when a gigantic snowslide swept down from the mountains and smothered this large mining camp in Utah, the largest open copper mine in the world.

5.—Along the Louisiana gulf coast where birds flock undisturbed during the winter months.

6.—Miss Elizabeth Wrenn, one of Washington's most popular debs of this season.

7.—One of the many boats drying thousands of fish in the sun ready for market.

8.—Niagara Falls frozen over. At night many electric floodlights illuminate the falls.

ICE-BOUND HEARTS

By James Oliver Curwood

HOW THE STORY STARTED

AT POINT FULLERTON, 1000 miles north of civilization, Sergeant William MacVeigh concluded his semi-annual report to the commissioner of the Royal Northwest Mounted Police. "I have made every effort to run down Scottie Deane, the murderer. I have not given up hope of finding him, but I believe that he has gone from my territory. . . ." On his bunk in a corner of the little cabin lay his comrade, Private Pelletier, sick, almost to madness after nine months of loneliness—without a sight of other white men or women.

Half an hour later MacVeigh set out for Fort Churchill, 450 miles across the ice to deliver the report, get medicines and letters for Pelletier from the girl back home. While in Churchill a half-breed brought word he'd seen a white man and woman ten miles south of the Maguse River. A white woman in this region was unusual, her reason for being there so puzzling, that MacVeigh decided to hunt for them.

Suddenly out of the silent loneliness that night came the sound of sledge runners and then into sight a human figure, three dogs and a toboggan. Billy strode forward with a loud halloo. A white face stared at him—the face of a woman. She was alone. In a long, rough box she was taking her husband, who had died three days before, back to her people 200 miles away. Billy promised to see her safely to her destination, the Little Seal. Later, around the fire which he had built in a growth of spruce, he told her of Pelletier sick at Point Fullerton, of their loneliness, of his own longing for the sight of a woman, and of the girl who had failed him and married another fellow back home. "I'd like to let you know—some way—what you've done for me. You—and this."

(Continued from last week)

HE HAD unfolded the buckskin and gave it to her. In it were the big blue petals and dried stem of a blue flower.

"A blue flower!" she said.

"Yes. You know what it means. The Indians call it I-o-waka, or something like that, because they believe that it is the flower-spirit of the pruest and most beautiful thing in the world. I have called it—woman."

He laughed, and there was a joyous sort of note in the laugh.

"You may think me a little mad," he said, "but do you care if I tell you about that blue flower?"

The woman nodded. There was a little quiver at her throat which Billy did not see.

"I was away up on the Great Bear," he said, "and for ten days and ten nights I was in camp—alone—laid up with a sprained ankle. It was a wild and gloomy place, shut in by barren ridge-mountains, with stunted black spruce all about, and those spruce were haunted by owls that made my blood run cold nights. The second day I found company. It was a blue flower. It grew close to my tent, as high as my knee, and during the day I used to spread out my blanket close to it, and lie there and smoke. And the blue flower would wave on its slender stem, an' bob at me, an' talk in sign language that I imagined I understood.

"Sometimes it was so funny and vivacious that I laughed, and then it seemed to be inviting me to a dance. And at other times it was just beautiful and still, and seemed listening to what the forest was saying—and once or twice—I thought—it might be praying. Loneliness makes a fellow foolish, you know. With the going of the sun my blue flower would always fold its petals and go to sleep like a little child tired out by the day's play, and after that I would feel terribly lonely.

"BUT it was always awake again when I rolled out in the morning. The time came when I was well enough to leave. On the ninth night I watched my blue flower go to sleep for the last time. Then I packed. The sun was up when I went away the next morning, and from a little distance I turned and looked back. I suppose I was foolish and weak for a man, but I felt like crying. Blue flower had taught me many things I had not known before. It had made me think. And when I looked back it was in a pool of sunlight, waving at me!

"It seemed to me that it was calling—calling me back—and I ran to it—and picked it from the stem—and it has been with me ever since that hour. It has been my Bible an' my comrade an' I've known it was the spirit of the purest and the most beautiful thing in the world—a woman. I—" His voice broke a little. "I—I may be foolish, but I'd like to have you take it, an' keep it—always—for me."

He could see now the quiver of her lips as she looked across at him.

"Yes, I will take it," she said. "I will take it, and keep it—always."

"I've been keeping it—for a woman—somewhere," he said. "Foolish idea, wasn't it? And I've been telling you all this, when I wanted to hear what happened back there, and what you are going to do when you reach your people. Do you mind—telling me?"

"He died—that's all," she replied. "I promised to take him back—to my people. And when I get there—I don't know—what I shall—do—"

She caught her breath. A low sob broke from her lips.

"You don't know—what you will do—"

Billy's voice sounded strange, even to himself. He rose to his feet, and looked down into her upturned face, his hands clenched, his body trembling with the fight he was making. Words came to his lips, and were forced back again — words which almost won in their struggle to tell her again that she had come to him from out of the barren like an angel; that within the short space since their meeting he had lived a lifetime, and that he loved her as no man had ever loved a woman before. Her blue eyes looked at him questioningly as he stood above her.

And then he saw the thing which for a moment he had forgotten—the long, rough box at the woman's back. His fingers dug deeper into his palms, and with a gasping breath he turned away.

A hundred paces back in the spruce, he had found a bare rock with a red bakneesh vine growing over it. With his knife he cut off an armful, and when he returned with it into the light of the fire, the bakneesh glowed like a mass of crimson flowers. The woman had risen to her feet, and looked at him speechlessly as he scattered the vine over the box. He turned to her, and said softly:

"In honor of the dead!"

The color had faded from her face, but her eyes shone like stars. Billy advanced toward her, with his hands reaching out. But suddenly he stopped and stood listening. After a moment he turned and asked again:

"What was that?"

"I heard the dogs and the wind," she replied.

"It's something cracking in my head, I guess," said MacVeigh. "It sounded like—"

He passed a hand over his forehead, and looked at the dogs huddled in deep sleep beside the sledge. The woman did not see the shiver that passed through him. He laughed cheerfully, and seized his ax.

"NOW for the camp," he announced. "We're going to get the storm within an hour."

On the box the woman carried a small tent, and he pitched it close to the fire, filling the interior two feet deep with cedar and balsam boughs. His own silk service-tent he put up back in the deeper shadows of the spruce. When he had finished he looked questioningly at the woman, and then at the box.

"If there is room—I would like it in there—with me," she said, and while she stood with her face to the fire, he dragged the box into the tent. Then he piled fresh fuel upon the fire, and came to bid her good night. Her face was pale and haggard now, but she smiled at him, and to MacVeigh she was the most beautiful thing in the world. Within himself he felt that he had known her for years and years, and he took her hands and looked down into her blue eyes, and said almost in a whisper:

"Will you forgive me if I'm doing wrong? You don't know how lonesome I've been—and how lonesome I am—and what it means to me to look once more into a woman's face. I don't want to hurt you, and I'd—I'd—" his voice broke a little—"I'd give him back life if I could, just because I've seen you, and know you, and—and love you."

She started, and drew a quick sharp breath that came almost in a low cry.

"Forgive me, little girl," he went on. "I may be a little mad. I guess I am. But I'd die for you, and I'm going to see you safely down to your people—and—and — I wonder — I wonder—if you'd kiss me good night—"

Her eyes never left his face. They were dazzlingly blue in the firelight. Slowly she drew her hands away from him, still looking straight into his eyes, and then she placed them against each of his arms, and lifted her face to him. Reverently he bent and kissed her.

"God bless you!" he whispered.

For hours after that he sat beside the fire. The wind came up stronger across the barren; the storm broke fresh from the north; the spruce and the balsam wailed over his head, and he could hear the moaning sweep of the blizzard out in the open spaces. But the sounds came to him now like a new kind of music, and his heart throbbed and his soul was warm with joy as he looked at the little tent wherein there lay sleeping the woman whom he loved.

He still felt the warmth of her lips; he saw again and again the blue softness that had come for an instant into her eyes, and he thanked God for the wonderful happiness that had come to him. For the sweetness of the woman's lips and the greater sweetness of her blue eyes told him what life held for him now.

A day's journey to the south was an Indian camp. He would take her there, and would hire runners to carry Pelletier's medicines and his letters. Then he would go on—with the woman—and he laughed softly and joyously at the glorious news which he would take back to Pelletier a little later. For the kiss burned on his lips, the blue eyes smiled at him still from out of the firelight gloom, and he knew nothing but hope.

It was late—almost midnight—when he went to bed. With the storm wailing and twisting more fiercely about him, he fell asleep. And it was late when he awoke. The forest was filled with a moaning sound. The fire was low. Beyond it the flap of the woman's tent was still down, and he put on fresh fuel quietly, so that he would not awaken her. He looked at his watch, and found that he had been sleeping for nearly seven hours. Then he returned to his tent to get the things for breakfast. Half a dozen paces from the door-flap he stopped in sudden astonishment.

HANGING to his tent, in the form of a great wreath, was the red bakneesh which he had cut the night before, and over it, scrawled in charcoal on the silk, there stared at him the crudely written words:

"In honor of the living."

With a low cry, he sprang back toward the other tent; and then, as sudden as his movement, there flashed upon him the significance of the bakneesh wreath. The woman was saying to him what she had not spoken in words. She had come out in the night, while he was asleep, and had hung the wreath where he would see it in the morning.

The blood rushed warm and joyous thru his body, and with something which was not a laugh, but which was an exultant breath from the soul itself, he straightened himself and his hand fell in its old trick to his revolver holster. It was empty.

He dragged out his blankets, but the weapon was not between them. He looked into the corner where he had placed his rifle; that, too, was gone. His face grew tense and white as he walked slowly beyond the fire to the woman's tent. With his ear at the flap he listened. There was no sound within—no sound of movement, of life, of a sleeper's breath; and, like one who feared to reveal a terrible picture, he drew back the flap. The balsam bed which he had made for the woman was empty, and across it had been drawn the big rough box. He stepped inside. The box was open—and empty, except for a mass of worn and hard-packed balsam boughs in the bottom. In another instant the truth burst in all its force upon MacVeigh. The box had held life, and the woman—

Something on the side of the box caught his eyes. It was a folded bit of paper, pinned where he must see it. He tore it off, and staggered with it back into the light of day. A low, hard cry came from his lips as he read what the woman had written to him:

> May God bless you for being good to me. In the storm we have gone—my husband and I. Word came to us that you were on our trail, and we saw your fire from out on the barren. My husband made the box for me, to keep me from cold and storm. When we saw you, we changed places, and so you met me with my dead. He could have killed you—a dozen times, but you were good to me, and so you live. Some day may God give you a good woman who will love you as I love him. He killed a man, but killing is not always murder. We have taken your weapons, and the storm will cover our trail. But you would not follow. I know that. For you know what it means to love a woman, and so you know what life means to a woman when she loves a man.
>
> Mrs. Isobel Deane.

Like one dazed by a blow, Billy read once more the words which Isobel Deane had left for him. He made no sound after that first cry that had broken from his lips, but stood looking into the crackling flames of the fire until a sudden lash of the wind whipped the note from between his fingers and sent it scurrying away in a white volley of fine snow.

The loss of the note awoke him to action. He started to pursue the bit of paper, then stopped and laughed. It was a short, mirthless laugh—the kind of laugh with which a strong man covers pain. He returned to the tent again and looked in. He flung back the tent-flaps so that the light could enter and he could see into the box. A few hours before that box had hidden Scottie Deane, the murderer. And she was his wife!

He turned back to the fire, and he saw again the red bakneesh hanging over his tent-flap and the words she had scrawled with the end of a charred stick, "In honor of the living." That meant him. Something thick and uncomfortable rose in his throat, and a blur that was not caused by snow or wind filled his eyes. She had made a magnificent fight. And she had won. And it suddenly occurred to him that what she had said in the note was true, and that Scottie Deane could easily have killed him.

The next moment he wondered why he had not done that. Deane had taken a big chance in allowing him to live. They had only a few hours' start of him, and their trail could not be entirely obliterated by the storm. Deane would be hampered in his flight by the presence of his wife. He could still follow and overtake them. They had taken his weapons—but this would not be the first time that he had gone after his man without weapons.

Swiftly the reaction worked in him. He ran beyond the fire, and circled quickly until he came upon the trail of the outgoing sledge. It was still quite distinct. Deeper in the forest it could be easily followed. Something fluttered at his feet. It was Isobel Deane's note.

He picked it up, and again his eyes fell upon those last words that she had written: "But you would not follow. I know that. For you know what it means to love a woman, and so you know what life means to a woman when she loves a man."

That was why Scottie Deane had not killed him. It was because of the woman—and she had faith in him. This time he folded the note and placed it in his pocket, where the blue flower had been. Then he went slowly back to the fire.

"I told you I'd give him back his life—if I could," he said. "And I guess I'm going to keep my word!" He fell into his old habit of talking to himself—a habit that comes easily to one in the big open spaces—and he laughed as he stood before the fire and loaded his pipe. "If it wasn't for her," he added, thinking of Scottie Deane; "Gawd—if it wasn't for her!"

(To be continued next week)

"How old is your cow?"
"Two years."
"How can you tell?"
"By her horns."
"Oh, yes, I see. It only has two."

News and Notes

PHILADELPHIA recently suffered a water shortage which was caused by too much water. Part of the city's supply comes from the Schuylkill River. The large amount of mud in the water, caused by a flood, clogged the filters faster than they could be cleaned, and let only a small amount of purified water go thru.

* * *

When a thirty-three-mile canal is completed across the state of New Jersey there will be an inland waterway, about 1000 miles long, extending from Boston, Massachusetts, to Beaufort, North Carolina.

* * *

A large New York engraving company prints paper money for the United States government and for forty-one foreign countries. Each piece of paper money, stamp and bond is counted thirty-seven times during the process of manufacture to insure against loss due to the carelessness or dishonesty of employes.

* * *

About 1000 motor trucks, most of them of five tons capacity, and 10,000 men were employed in clearing the streets of Philadelphia after a recent snow storm. Besides these scores of snowplows and electric sweepers were used to keep the trolley tracks open. This one storm cost the city a quarter of a million dollars.

* * *

The number of horses and mules in the United States more than two years old decreased about six per cent from 1920 to 1925. BUT, the number of colts under two years of age decreased fifty-one per cent, according to the United States Department of Agriculture.

* * *

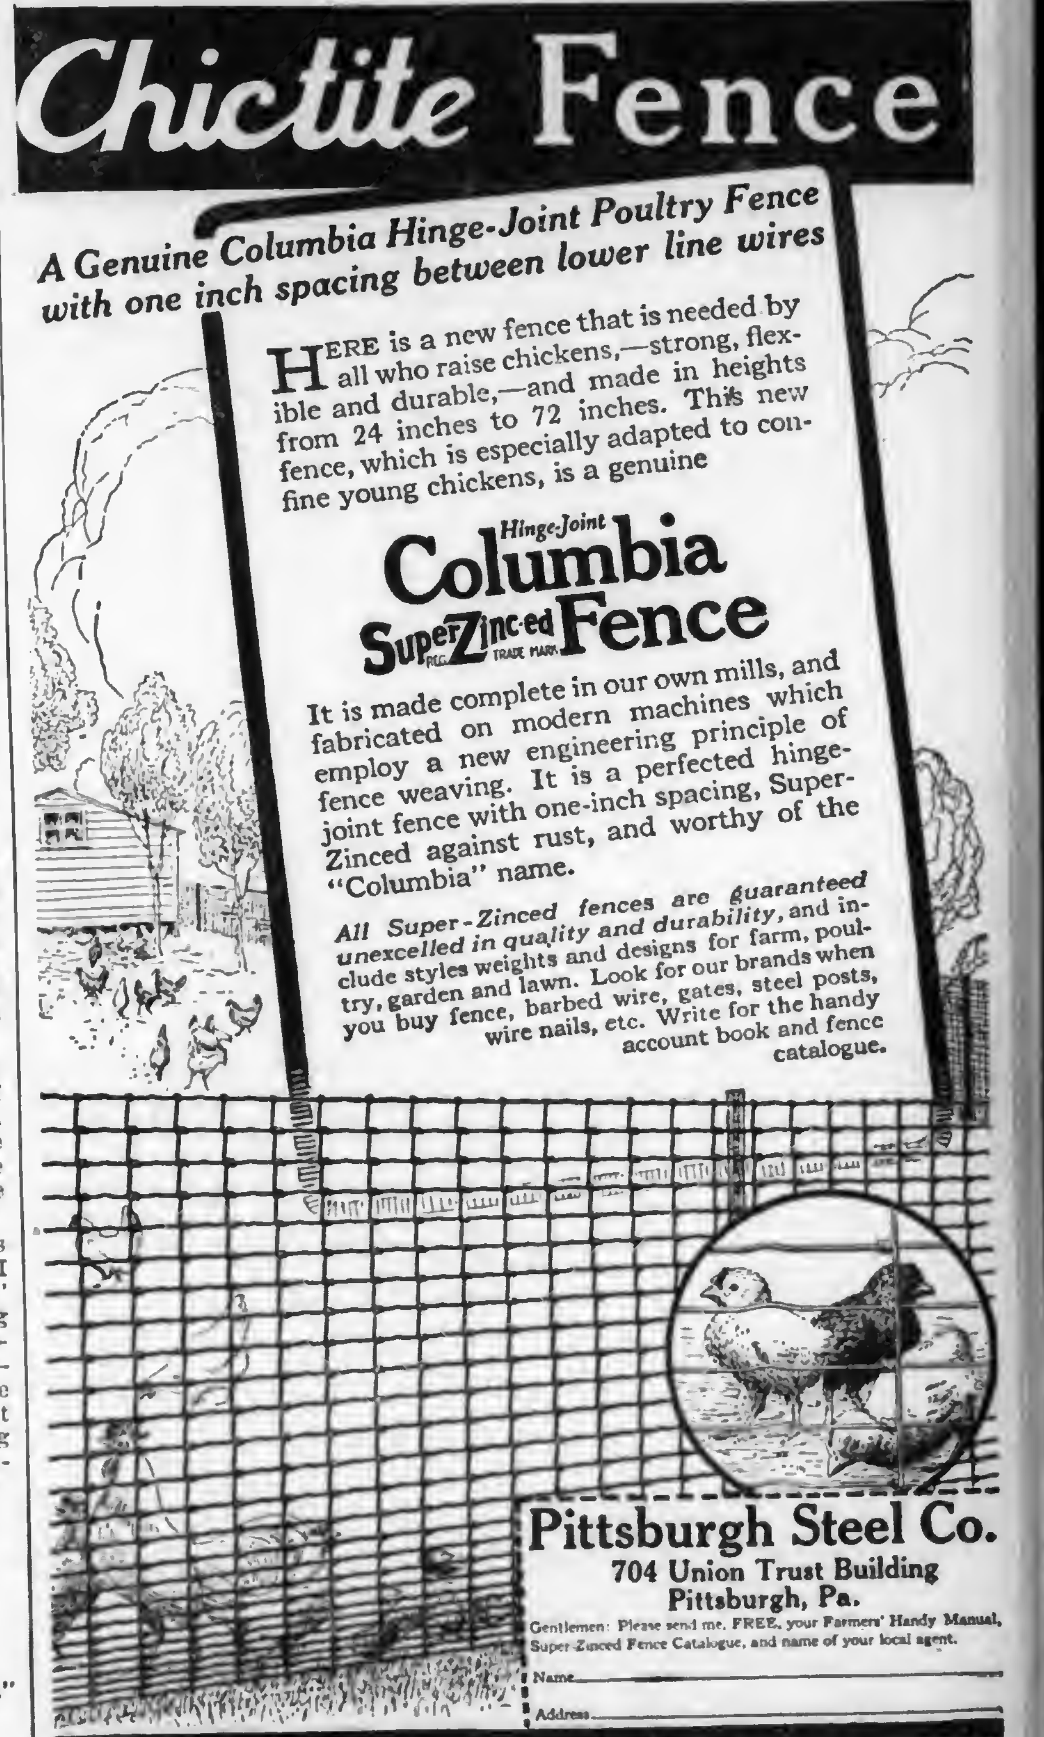
"Plant a barn for your grandson," is the advice of the New York State College of Agriculture. An acre and a half of white pine planted fifty years ago would now have enough timber to build a good barn.

* * *

Children are being killed on the streets of Philadelphia at the rate of 240 a year by automobiles, motor trucks and trolley cars. Most of these accidents are due to the fact that children are allowed to play on the sidewalks and in the streets.

* * *

At a recent ball given in honor of a rich man's debutante daughter in a large city hotel, the ballroom was decorated with large numbers of orange trees and branches of palms which had been sent from Florida for the occasion. Monkeys chattered in the trees, according to the newspaper reports, and hundreds of birds fluttered about, tied by silken cords to the trees so they couldn't fly too far. "Supper was served at 1 A. M. to 1200 guests."



Chictite Fence

A Genuine Columbia Hinge-Joint Poultry Fence with one inch spacing between lower line wires

HERE is a new fence that is needed by all who raise chickens,—strong, flexible and durable,—and made in heights from 24 inches to 72 inches. This new fence, which is especially adapted to confine young chickens, is a genuine

Hinge-Joint Columbia Super-Zinc-ed Fence

It is made complete in our own mills, and fabricated on modern machines which employ a new engineering principle of fence weaving. It is a perfected hinge-joint fence with one-inch spacing, Super-Zinced against rust, and worthy of the "Columbia" name.

All Super-Zinced fences are guaranteed unexcelled in quality and durability, and include styles weights and designs for farm, poultry, garden and lawn. Look for our brands when you buy fence, barbed wire, gates, steel posts, wire nails, etc. Write for the handy account book and fence catalogue.

Trouble getting help?

GETTING help at harvest time is a problem for every farm. That is one reason why the demand for electricity on farms has grown so much.

In Red Wing, Minn., W. A. Cady can harvest his corn much earlier than his neighbors, because he cures it electrically. He has equipment which reduces the handling of grain before it is ready to use as feed, from five operations to one. He has electric milkers, cream separators, pumping and heating equipment and other productive and labor-saving devices.

Experiments in seventeen states are helping to develop machinery which will make electricity profitable to the farmer as well as making life pleasanter for him and his family.

Groups of farmers who are ready to buy the necessary appliances will always find their light and power company ready to cooperate with them in any movement for farm electrification that is economically sound.

The Committee on Relation of Electricity to Agriculture is composed of economists and engineers representing the U. S. Depts. of Agriculture, Commerce and the Interior, Amer. Farm Bureau Federation, National Grange, Amer. Society of Agricultural Engineers, Individual Plant Manufacturers, General Federation of Women's Clubs, American Home Economics Ass'n., National Ass'n. of Farm Equipment Manufacturers, and the National Electric Light Association.

The Most Intelligent Animal

(Continued from page 3)

passed and there she slept. She always sang sweetly as dusk settled down, and she was alone in her strange quarters. One evening as she passed the sitting room door going to "bed," mother said gently, but firmly: "Humpty, you had better go into the henhouse."

Humpty stopped, turned her head and gazed intently at the speaker, then she uttered such a strange little note as tho asking if she really ought.

"Yes," mother repeated, "go to the henhouse, Humpty."

After a minute Humpty turned and went to the henhouse, flew on the roost and never again slept under the house. — A Pennsylvania Reader.

A Member of the Family

THE most intelligent farm animal I ever knew was a bird dog, white with tan spots. He came to our house when he was a pup. We named him Don, fed him, gave him a blanket to sleep on and he never left us. He would go with neighbors who went hunting, as far as our line fence, then come home. No coaxing could get him any farther.

My husband was drawn on a jury and had to be away from home nearly a week. One afternoon Don, the children and I were in the living room. Don jumped up, looked out of the window, then ran to the kitchen door, the children after him.

When I got to the kitchen my husband had our littlest girl in his arms, and was kissing her; then our next girl had to hug and kiss her dad, and then our son.

Don must have thought it his turn then for he tried to kiss my husband, but he said, "Down, Don." The poor dog looked as tho he had been slapped. I said, "Oh, Will, Don wanted to kiss you." He said, "Don, did you want to kiss me?" Don jumped up, put his fore paws on Will's shoulders and licked his cheek, then got down and capered around the room just like the children did. I think he thought he was one of our children.

When his master took a load of truck to Scranton, Don would go with him as far as the bridge, wait until he had crossed, then come home and wait until 6 P. M. Then he would go down to the bridge, meet his master, get on the wagon and ride to the barn.—M. P. K., Lackawanna County, Pa.

Likes to Swim

Princess, owned by Ada P. Gehman of Lehigh County, enjoys swimming and likes to have her picture taken.

Billy Fought for His Rights

FOR an animal of no "breed" our cat, Billy, was a wise cat, probably because he was a kitten when Wm. J. Bryan first ran for the Presidency and was named for him, but went by the name of "Billy." He lived to be nineteen years old and then we thought best to carefully kill him as he looked moth eaten and life was no more a frisky thing.

However, during all these years he was very wise and unusual. In summer time we could scarcely coax him into the house and in winter time we could hardly keep him out; but of all wise things, he knew the chair that belonged to my father and to him. The minute father got off the chair the cat was on, and when he saw my father coming he would at once jump off the chair and curl up at the foot of the rocker. Woe to any others who ventured to sit in that chair. Billy would pull on their clothes, jump on their lap and start to scratching and put up a real fight, even to members of the family, until they got up. But the minute my father came, Billy at once realized that he had first right, but Billy and only Billy had second right. —M. M. R., Bucks County, Pa.

A Gander Led the Blind

THIS true little tale may convince people that at least some farm animals and fowls do think.

About eight years ago, while I was still at home on the farm, my father who was growing blind from cataracts on his eyes, bought a pair of young geese.

As the gander was white, he grew very beautiful. We all would have loved him for a pet, but he became very cross and would not let anyone pet him except my father, of whom he was very fond.

Altho my father was almost blind, he still insisted on doing his own work about the barn, for he loved the animals. Usually one of the family led him to the barn, but when no one happened to be with him, the gander would come running to the gate, wait for my father to pet him and then walk ahead of him to the barn.

On account of his being white and also making a noise as ganders do, he became a very good guide. No one ever taught this gander the trick of leading my father to the barn, but he seemed to think it out for himself.—Mrs. Pearle Moore, Clarion County, Pa.

Duck Reunion—Invalid Jim

I WENT to the corn barn, at feeding time one evening. My old mother duck was making a big ado. She was shut in while her six ducklings were shut out. Thinking something had happened the ducklings, I hurried out to see if they were about. The mother duck was in a hurry, too. If I ever saw a happy reunion it was when those ducklings came around a corner and saw their mother. They rushed together, and that old duck gave each of her babes as affectionate a kiss as ever a mother did, neither missing one nor giving any one a second kiss, bowed and chatted all around and started off looking as happy as could be.

We had a sick horse, so sick he could not get up without help. We treated him and helped him up a long time. Finally we found he had learned to like the excitement of being helped up. If he tripped on a bar, or any place in any way, he would roll over, look around, as much as to say, "Here, I am down, ready to be helped up." At last Daddy tried the whip and found that Jim could easily help himself up, if he thought he must. We did not have to lift him any more.—A. S., Lancaster County, Pa.

Contest Editor's Note:—More of these interesting letters about farm animals will be published in future issues, together with other letters from preceding weekly contests.

Doctor Lipman's Weekly Talk on Soil Fertility Problems

Spring versus Fall Seeding of Forage Crops

Please suggest how I can get a good stand of hay on a field which now has a cover crop of rye. I prefer to make the seeding this spring. Is poultry manure a good fertilizer for grape vines?—D. M., Kent County, Delaware.

IT IS doubtful whether you could depend on securing a good catch of timothy and clover if you seeded down this spring. The rainfall conditions are too uncertain to justify the undertaking. This is said in spite of the fact that not infrequently a successful stand of grass is obtained from spring seeding. If, however, you wish to try it, it might be well to sow the timothy and clover with a nurse crop of oats or barley, using five to six pecks of oats or barley to give you a fairly thin stand but enough to afford the young grass seed some protection.

It would be wiser to plow the rye in April, or, if you are very short of forage, to cut it early in May and feed it green, and then plow the land and fit it for corn, using, as you suggest, about 500 pounds of a 3-8-5. By growing an early maturing variety of corn, or by growing silage corn, you would clear the ground sufficiently early in your locality to permit fall seeding.

Apply Lime First

Prior to seeding down, it would be desirable to make an application of lime. If it is more convenient the lime may be applied this spring for the corn, even tho ordinarily liming does not benefit the corn crop directly. Now and then, especially in the case of heavy land well supplied with humus, an application of lime would exert a marked benefit to the corn since the soil would be made more friable and open and more nitrogen made available. The plan of manuring the grass in the fall or winter is to be commended.

Different crops or combinations of crops may be suggested for early hay. Oats and Canada field peas, sown at the rate of one and one-half bushels per acre, might answer your purpose. If you do not care to go to the expense of buying peas for seed, oats alone might do and if cut early should make a good hay. Barley and vetch is now and then recommended for the purpose. Where oats alone are sown, it would be desirable to apply nitrate of soda or sulphate of ammonia to make sure that a rank growth is obtained. From 100 to 125 pounds of nitrate of soda or 80 to 100 pounds of sulphate of ammonia per acre may be used for the purpose. Barnyard millet may also produce a good hay crop on fertile land or land that is well manured.

Excessive quantities of hen manure, or of any other manure rich in ammonia, will, it is true, cause rank growth of vegetation, grape vines included. Such excessive applications of ammonia fertilizers will naturally, interfere with seed or fruit formation. On the other hand, small quantities of hen manure should help the grapes rather than hinder them. Since hen manure is not a balanced fertilizer, it would be well to mix some acid phosphate with it. It might be well, also, to broadcast the fertilizer between the rows except where very small quantities are used. In that case it may be applied around the vines.—J. G. Lipman.

When to Apply Manure

I am a Snyder County farmer, farming in rotation, corn, oats, wheat and grass. On which of these crops should I put my maure and when, before or after plowing? What analysis of fertilizer is advised on each of these crops for best results and building up soil? It is flint soil. —C. A. A., Snyder County, Pa.

It has been repeatedly shown that in a rotation like yours manure could be utilized to best advantage when applied either before seeding down to wheat and grass or after the sod is plowed and the ground fitted for corn. Everything considered, you would make no mistake in applying the manure for corn.

A good application of commercial fertilizer should be made for the wheat and grass in order to assure you both a good wheat crop and a good hay crop.—J. G. Lipman.

Apple Vending Machine

VENDING machines for chewing gum, candy and peanuts are common but out in the Northwest they are developing a machine to sell apples. Well known popular varieties of apples will be used and the machines placed in public places such as railroad stations.

Apple men are enthusiastic over this proposed outlet for their products and are anxiously awaiting the results of this experiment.—W. R. Whitacre.

He Runs Away from Work

Frank and the children of Clayton Landis of Bush Mill Farm, Dauphin County, Pa., which is owned by Hiram E. Bishop. The boys say that Frank eats as much hay as an elephant. He is lazy, too, and doesn't care who knows it.

Good Fences make good neighbors!

THERE'LL be no trouble with your stock getting into your neighbor's field or your neighbor's stock injuring your crops if your farm is fenced with LEADCLAD.

LEADCLAD Fence, once up, is up for good.

LEADCLAD wire is protected with a jacket of pure lead, seven times heavier than the coating of zinc on ordinary fence. Heat, frost or dampness have no effect on lead. Rust can't get through. The small illustrations at the side show how the pure lead jacket protects LEADCLAD Fence. It doesn't crack, chip or peel off.

Some of your neighbors may be using LEADCLAD; thousands of farmers are. Mr. Vankirk is one who knows what LEADCLAD means to his pocketbook—read what he says—

Leadclad Wire Co.

Sirs:—I was among the first in this section to use your Leadclad fence. I put it up on my farm about four years ago and it still is free of rust and seems as good as when put up.

I believe it will last at least twice as long as galvanized fencing. I don't hesitate to recommend it to farmers as the best and most economical fence on the market.

Leroy W. Vankirk,
622 N. Main St.,
Washington, Pa.

Take your knife and shave a piece of LEADCLAD wire. Note how thick the pure lead jacket is. You can't scrape all the lead off, even with a sharp knife. Bend, twist and hammer a piece. Note that it can be completely flattened without chipping, cracking or peeling the protecting lead jacket.

Our big catalog shows all styles of LEADCLAD for farm, poultry and lawn use.

LEADCLAD Fence is priced Factory to You, Freight Paid. Write today for catalog, prices and our 5% Club Offer.

BLACK HAWK PLANTER

Earns Its Cost in One Season

Pulverizer

Cultivator

A hill of corn skipped here and there—or the wrong number of kernels in the hills may easily cost you more than the price of a planter.

Your soil, your fertilizer, your cultivating and harvesting cost just as much for the short hills as they do for the full hills.

The good old Black Hawk always plants the hill—it never misses.

The "Edge Drop" always puts the right number of kernels in each hill.

Black Hawk was the first planter to give the farmer these features and the name "Black Hawk" is still the best guarantee of a full crop.

"Good Equipment Makes a Good Farmer Better"

The Ohio Cultivator Company, Bellevue, Ohio

A New White Diarrhea Tablet

Diarrhea among small chicks has become so prevalent that it has engaged the attention of our foremost men of science.

At the instance of Dr. Hess & Clark a group of veterinarians and chemists have made diarrhea in chicks a subject of scientific research.

These men have evolved an entirely new tablet for White Diarrhea—in fact, any form of diarrhea affecting poultry.

Dr. Hess & Clark are now manufacturing this new diarrhea tablet and placing it on the market this season for the first.

You will want this new tablet, which is the last word in medical science for White Diarrhea, either as a preventive or as a remedy.

You can secure this tablet from any Dr. Hess & Clark dealer. Ask for

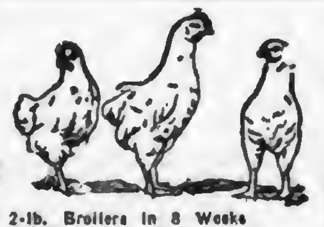
Dr. Hess
WHITE DIARRHEA TABLETS

Then follow these simple directions:

Crush and dissolve just 4 tablets in each gallon of drinking water (one tablet to a quart). Stir once thoroughly, then let your chicks run to it; they will doctor themselves.

Make a fresh solution each day.

Our guarantee covers this tablet absolutely. DR. HESS & CLARK, Inc.



Cycle Coal Brooders

Grow 2-lb. Broilers in 8 Weeks
Reduce Chick Losses — Save Labor
INCREASE PROFITS

With this simple, easy way of brooding chicks you can make more money from your chickens. Just the right conditions are provided to promote rapid healthy development. Automatic regulation of temperature needs only one adjustment during a whole season. Plentiful supply of pure fresh air that raises healthy chicks. Requires attention only twice daily. Cycle Brooders are made of gray iron castings that last.

Large size, 52-inch canopy, $17.75.

Large stock ready for immediate shipment. Catalog of complete line of poultry equipment sent free.

TELL the advertiser you saw adv. in Pennsylvania Farmer.

What I Would Do with $1000

"MAYBE PRINCE CHARMING WILL COME ALONG"

SHOULD Fate hand me out $1000, you'd have to give me a while to "come back to earth!" Then when I had gathered my senses together, and realized that it was really "mine, all mine," I dare say the uses for it would enter my mind so thick and fast, I'd have to stop and "budget" it, or I would find I had thought up ten thousand dollars' worth, instead of one!

Without a second thought I would know that the first $50 of it would be sent to pay the balance due on a typewriter, which I am buying on the installment plan.

Secondly, should I hear my brothers say, "My word, that $200 note is due at the bank," I would feel so big and it would give me so much pleasure to say, "Here, boys, I'm rich, don't renew it."

Would Share with Children

Then, as I am terribly fond of children, I would gather the poor little youngsters of the neighborhood around me and say, "What do you want more than anything else in the world?" Providing their wants are within reason, I would be so happy to fulfill their small desires.

At that point I'd have to stop and figure out, "Now have I enough left to buy a little flivver and tour the United States?" If so, "By George," that's what I'd do! At least that's what I think I'd do.

But woman's mind, you know, is subject to change without notice. Maybe, if I actually found that $1000 in my hand, I'd rush right up to my bedroom, rip open the mattress, sew it in, and then dream pretty dreams on it, "Maybe Prince Charming will come along some day, poor, but honest, and oh, I'm so glad I saved this thousand—the first payment on our little love nest."—A. H. S., Gloucester County, N. J.

"ALL WORK AND NO PLAY—"

IF I HAD one thousand dollars to do with as I liked I would put part of it out at interest. Then I would like to take out insurance for my little girl. The balance I would put in the bank to use as I wanted.

I am a farmer's wife and it would be my aim to make life on the farm just as easy and pleasant as possible.

I would have as many modern conveniences in house and barn as possible so husband and I would have time to enjoy life and be pals to our children.

I would like a musical instrument or two as I think a home is not complete without music of some kind.

If I had a phonograph I would like a few sacred songs, also some sermons and bible readings to help us in our quiet hour.

And a Few Good Magazines

I would take a few good papers and magazines. Among them would be "Pennsylvania Farmer," as I think it is a very helpful and interesting paper.

I would give to church, Sunday school and any organization that would furnish our boys and girls good, wholesome recreation and keep them happy and contented.

"All work and no play makes Jack a dull boy." That applies to fathers and mothers as well.

I would endeavor to make home life on the farm so pleasant that my children would love God's great outdoors and would never want to leave the farm.

Last, but not least, I would give my children a good education and a course in agriculture, poultry raising, domestic science, etc., if they so desired.

If one could accomplish all this with the help of one thousand dollars I think the money would be well spent.—A Farmer's Wife, Potter County, Pa.

SATURDAY NIGHT—AND NO BATHROOM

HOW would I spend $1000 if I had that amount and there were no strings attached to it? What strings would have to be loosened if the average farmer (myself included) could spend this amount freely?—Debts paid or know how they were going to be paid—Taxes for the year paid in full (including dog tax)—A little more than his share of the preacher's salary, and that old doctor bill.

This sum of money would put into the farm home a permanent supply of water and a bathroom, two things that would contribute much to the comfort of the home.

Regardless of what our wives would think, we men would like to give them the luxuries of the city home,—or shall we say the necessary equipment of the farm home.

Most of our farms have near the house a more or less uncertain supply of water, a spring that will go dry, a well whose pump will be out of order. Our wives always hold us men responsible when the pump is out of order or the spring is dry.

Were You Ever the Man?

Did you ever come in at night thinking you were thru and be met at the door with an empty pail, a woman's hand holding it out, and the sweetest voice saying thru a crack in the kitchen door, "A pail of water, please."

A bathroom! Just a place for the wife and the girls to fix-up in. Men never use such a room nor do they have any need for it. (Don't they, tho!)

Each Saturday evening on the Ellenhurst Farm the good wife brings in a small tub and after supper the stove is covered with kettles and pans of water. Usually the baby (one year old) gets in the empty tub, clothes and all on.

"Now, children, who will be the first? Papa will undress Martha and Miriam (one and two years old) and will wash the boys, David and Paul, and Mamma will wash the five girls." We have lots of fun, the oldest being eleven years old, but wouldn't a bathroom help!—L. C. T., Lycoming County, Pa.

A DREAM OF FOURTEEN YEARS

IN ANSWER to your question as to what I would do with $1000 if I had it, I would surely make some of my dreams come true.

I have been married fourteen years and have four children now. I was brought to live with my husband's parents. If I had $1000 or even less, I surely would have a little home of my own, with a garden and nice blue and white kitchen, with things as I have planned so many times for a real home to be mistress of.—Elsie Brown, Jefferson County, Pa.

An Oregon man was trying to sell a horse. The animal was wind-broken but sleek. The owner trotted him around for inspection and bringing him back to the prospect he stroked the horse's back and remarked, "Hasn't he a lovely coat?"

The prospect removed his pipe from his mouth and said, as he looked at the heaving flanks of the animal, "Yeah, his coat's all right, but I don't like his pants."—Med. Standard.

White Diarrhea

Remarkable Experience of Mrs. C. M. Bradshaw in Preventing White Diarrhea

The following letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Bradshaw tell of her experience in her own words:

"Dear Sir: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort I sent to the **Walker Remedy Co., Dept. 510, Waterloo, Iowa,** for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Cause of White Diarrhea

White Diarrhea (Coccidiosis) is caused by a protozoal organism of microscopic size which multiplies with great rapidity in the intestines of diseased birds and enormous numbers are discharged with the droppings. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that saves nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shenandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send WALKO White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for package of Walko (or $1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

Walker Remedy Co., Dept. 510 Waterloo, Iowa

Spend Wisely!

Don't put your hard earned money into a sprayer until you have learned all about the honestly built "Friend".

Single unit motor-pump; straight gear transmission, no belts, no chains; low down; short turn; large wheels—easy draft; adjust packing while pumping at high pressure are just a few of the many practical features that you'll appreciate. We make hand sprayers too.

The Voice of the People

"For Land Control"

EDITOR of Pensylvania Farmer:—One might think that your editorial "For Land Control"—and the many other similar editorials and articles being published in this country, that not only was serious consideration being given to the land question in Great Britain, but that a great leader of one of the great political parties over there was finding it profitable to advocate a radical solution. The question has reached a point in which all the political parties there, Tory, Liberal, Labor and Socialist, have given various views and issued "manifestos," but all of them offer solutions, somewhat different in detail, decidedly of a socialistic trend.

Even the Labor Party, that has had in its rank and file many of those who have made a life-long study of the problem, seems, like the Liberal Party of Lloyd-George, to see its significance and the absolute necessity of a solution, but all they have to offer is a plan of purchase which will merely mean the buying back, from what they all agree are the fradulent, even unlawful, possessors of Britain's land, by its rightful, and, according to Britain's fundamental law, its real owners—all the people. Apparently Lloyd-George, believing that some radical-appearing solution would be a vote getter, has in speeches and pen flourishes, employed such slogans as "God made the land and gave it to His children."

Remedy Will Appeal to Landlords

In a party like the Liberal Party, which includes in its membership many great owners of English soil, such words from its leaders might serve to "split the party wide open"—as we say in America. But we must remember that while he publicly gives out these great truths to get the support of rightful heirs who are now landless, his remedy will appeal to the landlords in that they will still be able to collect the rent of Britain, not any longer as landlords but as bond lords.

The C. L. P. declares that if the land of England is a national asset incapable of rightfully being classed as private property, in fact, is not so recognized in fundamental English law, and, that the obligation of service must be re-asserted, then there is only one thing to do. Make the rent of this national asset flow into the public treasuries of the nation—thus restoring to the people their rightful heritage.—Oliver McKnight, Centreville, Md.

Examinations for Farmers

TO THE EDITOR:—I should like to know the feeling and views of yourself of the rich man who migrates outside of most of our large cities, builds up his country estate and —? What affect would it have on conditions of the farms if there were no rented farms?

Shouldn't a farmer pass certain state examinations before being allowed to undertake to handle farm land? Would we have any over-production then?—W. W., Penneylvania.

Field Day Announced

THE annual Farmer's Field Day will be held Friday, June 18, at the Pennsylvania State College, according to an announcement made by T. I. Mairs, director of correspondence courses in agriculture and home economics, who is making arrangements for the meeting.

This is one day later than originally planned due to an extra day being added to the program for Young Farmers' Week.—A. L. B.

Does the Work of 10 Men!

Saws Wood Fast

This one-profit WITTE Log Saw uses Kerosene, Gas-Oil, Distillate or Gasoline and will cut from 10 to 25 cords of wood a day. Easy to operate and move. New device makes easy starting in any temperature. Trouble-proof. Fells trees and saws them into blocks—runs other farm machinery. Fast money maker and big labor saver. Completely equipped with WICO Magneto, speed and power regulator, throttling governor and 2 fly wheels.

Change to Tree Saw in 3 Minutes Ten seconds to clamp on tree. Saws them down level to the ground.

"Felled fifty 18-inch trees in less than 5 hours." Earl McBurney, Iowa.

30 Days' FREE TRIAL—Lifetime Guarantee Sold direct from factory to you. An all-purpose outfit for any farm use. Engine can be attached to pumps, grinders, etc.

Free—Write today for my new Free Book and Low Easy Payment Prices. No obligation. Or if interested, ask for our Engine, 3-in-1 Saw Rig or Pump catalogs.

Sheep Raisers Get This Book

Make More Money on your Wool

You should have this book on profitable "Breeds of Sheep for the Farm." It shows sheep raisers how to improve their flocks so they will produce more and higher grade wool.

Pay With Names

Simply give us the names and addresses of five or more farmers who raise sheep and the number of sheep in their flocks. We will then mail you this book free of charge, postage paid.

Our business was established in 1864 and we are one of the largest raw wool concerns. We pay highest prices for wool as we sell direct to woolen mills. Check mailed same day your shipment is received. We charge no commission.

Freed from Rupture

By a New Invention Test It Free

A new invention, so small that it cannot be detected beneath the closest fitting clothes, has been perfected; it retains rupture safely and heals the rupture.

Dancers, athletes, sportsmen, society women and people who do hard, tiring work have been healed in this new way. It is so comfortable that regardless of the position you assume, it does not hamper the body movement. Constructed of sanitary, non-irritating materials and assures absolute freedom from skin irritations. Send for Free Trial Offer, sent in plain, sealed envelope.

Standard middlings	30.50
Soft winter wheat middlings	31.20
Flour middlings	34.50
Red dog flour	38.50
White hominy	32.00
Gluten feed	39.20
36 per cent cottonseed meal	37.25
41 per cent cottonseed meal	39.25
43 per cent cottonseed meal	41.25
34 per cent linseed meal	48.70

For Baltimore, Cumberland and Williamsport rate points, subtract 20c per ton (for cottonseed meal 40c per ton); for New York, Newark rate points, add 40c per ton (for cottonseed meal 60c per ton); for Woodbury, Bridgeton rate points, add $1.00 per ton; for Freehold, Toms River, Cape May rate points, add $1.40 per ton.

Feed Market Situation

LOWER grain prices and a continued small demand caused continued weakness in the feed market during the week ending March 4th. Wintry weather prevailed over the northern part of the consuming territory but this failed to stimulate demand materially and prices of all feeds have continued on a downward trend. Wheat feeds have probably shown the greatest weakness with bran prices about $1 lower than last week. Middlings and other heavy wheat feeds have continued very weak but prices have not declined more than for bran. Plentiful supplies of both bran and middlings are being offered in all the markets.

Offerings of linseed meal are becoming heavier as mills have caught up on their orders and prices declined about $1 per ton during the week. Export demand is also limited and notwithstanding the lower prices about 17,000 tons less linseed meal and cake were exported from July to January, inclusive, than for the same period last year.

Cottonseed meal prices were unchanged but the market became slightly firmer, particularly in the Southwest. Some of the larger mills have finished their year's crushing and have closed down. Stocks are much larger than last year, however, and exports have also been much smaller than last year.

Production of corn feeds continues heavy. The larger manufacturers held their prices firm but some of the smaller plants were offering gluten feed below the quotations of the larger mills. The lower prices, however, have not greatly increased the demand altho stocks have not accumulated to any great extent. Hominy feeds continue weak with demand dull. Offerings exceeded demand in most markets and large buyers were bidding $1@2 below current prices.

Philadelphia Markets

THE Philadelphia potato market was slow and draggy during the week ending March 6, and prices declined, according to the Pennsylvania and Federal Bureau of Markets. The market on Pennsylvania round whites opened at $6.75 to $6.85 per 150-pound sack and closed at $6.50. The first car of barreled stock from Florida appeared this week and met a fair demand.

Apples were very dull and trading was unusually slow. Strawberry supplies were lighter toward the close of the week and prices held firm, with a fairly active demand. Supplies of new cabbage were moderate and prices declined. Spinach strengthened somewhat and prices were higher. Onions were very dull with a slow movement. Pennsylvania mushrooms have been generally moderate in supply but receipts today were heavier and prices declined on all but extra fancy stock.—W. R. Whitacre.

County News and Comment

Berks County, Pa.—Weather conditions very changeable last month. A few blizzards when traffic was tied up for a few days. Fifteen days good sleighing during month. Berks County Pomona will meet at Kutztown on March 6 with Mr. Gordon from State College in charge of the afternoon program. General theme of the program will be baby chicks and will be demonstrated by Kutztown talent exclusively. Farm sales well attended and fair prices were realized. Cows bring as high as $168 apiece. The county purchasing committee met and purchased fertilizers and seeds for the different Granges of the county. It is bought in bulk lots on a large scale which brings down the price. Most of wheat was sold at $1.85 some weeks ago. Now selling at $1.60. No potatoes being loaded at present. The last price was $2.50 f. o. b. Indications are that one carload of certified seed potatoes will again be bought for planting and distributed to the different localities of the county. The slogan "back to the farm" is practiced more than ever as farms will be tilled this year that have been idle for years. A few farms were sold recently for more than owners paid a few years ago. A few cars of hard coal have been received by dealers in last few days. Firewood still in great demand and deliveries made daily. Plenty of good ear corn in cribs but no market for it. Prices: wheat, $1.60; ear corn, 70c; oats, 50c; milk, 4 per cent, $2.35; eggs, 30c. Chickens at public sales bring 33c a lb.—W. N. M., March 3.

Carroll County, Md.—Week of February 7 to 13 we had heaviest snowfall of season. After snowstorm wind started blowing and soon a number of roads were blocked. Past week was warmer and rain fell which hastened melting of the snow. Streams are overflowing their banks due to the thaw. Due to bad weather during February so far not much outdoor work is being accomplished. The main work on good days is woodcutting and hauling manure. Season of sales of farm equipment has started. Number of public auctions to be held is less than usual. A new law is being enforced this year. All bed clothing offered at public sale must be sterilized and properly tagged by health officer before it can be sold. Wheat and barley looking good, especially wheat. Growing grain has had snow protection a good portion of winter. Hogs are scarce and high and corn is cheap, therefore not much corn crop has been marketed so far. Prices, wheat, $1.71 bu.; corn, $3.50 bbl.; eggs, 28c; old hens, 27c.—H. I. R., Feb. 22.

Clearfield County, Pa.—Real winter prevails. Clearfield County is now, after much confusion, promised the construction of an original primary road from our county seat to the southwestern part of the county. Marketing quiet just now with a little inquiry for table potatoes at about $2.50 per bushel. Not yet much rush searching for seed tubers. A spirit of caution seems hovering about. Apples in fair demand at $1@1.50; cabbage, 4c; turnips not much in demand and selling at $1; butter, 50@60c; eggs, 35@45c; local dealers are paying 4@8c for hides; baled hay, $22@28; straw, $14@16.—D. H. W., February 3.

Columbia County, Pa.—Despite the fact that the coon did not see his shadow, we have had an abundance of winter and a twenty-four-inch snow that has prevented any traveling of cars, except on state highways where the roads were opened by snow plows. Poultrymen ordering chicks and setting incubators. Market prices: wheat, $1.70; potatoes, $2.65; butter, 50c; eggs, 30c; chickens, 32c.—J. H. L., Feb. 26.

Cumberland County, Pa. — February was a very severe winter month with lots of snow and drifted roads. Not a very good month for getting any farm work done. Roads still full of snow and not much sign of spring. Conditions of winter wheat not as favorable as a year ago and a smaller crop is predicted. Acreage of other farm crops to be planted about as usual. Paul L. Edinger, Cumberland County Farm Agent, is planning corn variety introduction clubs and baby beef clubs among the boys and girls of the county. He expects to get a carload of calves to be distributed among the members of the beef club. Not many farms have changed hands this last year. Prices ranging from $75 to $175 per acre for good limestone land. Potatoes scarce at $2.25; wheat, $1.80; corn, 85c; oats, 65c; beef, by the quarter, 13c; poultry, 30c; eggs, 32c; butter, 55c.—A. L. B., Feb. 27.

Jefferson County, Pa.—From the first of February there has been a succession of snow falls. There has been good sledding and quite a lot of hauling done preparatory to spring work. Farmers are selecting and buying grass seed and ordering fertilizers for spring seeding. Stock looking well, plenty of rough feed. Hay and straw slow sale. Mill feed high in price. Most farmers getting their own grain ground into feed. Potatoes pretty well shipped out, local prices $2.25 to $2.50 per bushel. Boys and girls potato clubs will use potatoes from last year's crop for this year's planting instead of Michigan certified seed. Several hundred bushels of certified seed will be used also. Union Vocational School held a short course in farm dairying in connection with their other work this winter. Beechwoods Vocational School is conducting a farm course in cooperative marketing and care and management of livestock and soils.—F. A. M., Feb. 25.

Lackawanna County, Pa.—February gave us old fashioned winter weather. It commenced to snow the third and continued twenty-four hours, an average of eighteen to twenty-four inches on the level. Traffic held up, dozens of schools closed, no deliveries of mail or milk. Temperature dropped to twelve below zero. Ice about all cut and packed. Everybody looking toward spring. Strike settled and business in full swing again. Lackawanna County Pomona Grange met with South Abington Grange on February 16th. Four counties represented and a good attendance. Wood saws are busy getting summer supply of wood ready. Potatoes retailing for 83c per peck; eggs, 50c; butter, 48@50c; lard, 17c.—E. A. K., March 1.

Monmouth County, N. J.—February closed milder than it began. Very little farm work done. Snow in the early part of month tied up traffic for three days until roads were opened. Snow later in the month was even more severe, some roads being blocked to a depth of from five to seven feet. This gave some farmers an opportunity to make a little pocket money. Considerable wooding has been done this winter since coal has been scarce and high. Weather the past winter has prevented much orchard pruning on many days so that if most of the orchards are to be thoroly pruned some will need to be done as late as April. Egg production still low, ranging in many flocks less than thirty per cent. A few hatches have been brought off. Shortage of coal has delayed ordering of chicks especially where only small orders are placed. Dairying is taking a foremost position in the county, a county dairy association having been recently formed. The principal project fostered by the organization is a cow testing association which began work March 1st. There is some interest in raising calves as well as general all-around better dairy management.—E. D., March 2.

Northumberland County, Pa.—February has had real winter without any breakups. Deep snow of the third still covers the fields with a heavy blanket. Many country roads are yet unopened for traffic. Farm sales are much fewer than for several years past, while prices are higher. Hired help somewhat more plentiful than last year altho wages run as high as $50 per month, board and washing included. Prices: potatoes, $2.25; corn, 70c; oats, 37c; wheat, $1.72; pork, 18c; poultry, 27c; eggs, 32c; butter, 52c; milk, $2.20 for 3 per cent.—W. C. G., Feb. 25.

Sullivan County, Pa.—The winter has been very changeable. We have had much snow during February and part of January. Farmers who had small log jobs have them completed or nearly so. Ice harvesting also completed. The six-month tie-up of the anthracite industry and consequent scarcity of fuel, helped farmers to realize on woodlots that had not been in use for several years. Prices offered in this vicinity: potatoes, $2.50; eggs, 40c; butter, 48c; hay, $18; oats, 60c; buckwheat, 86c; corn, $2.25 cwt.—M. G., March 2.

Warren County, Pa.—Still lots of snow everywhere and many places along the river thruout the county threatened with worst flood in years. An ice gorge formed above Kinzua in the winter and has not yet moved but should the snow go off by the sun and wind, as it looks as tho it might today, instead of rains, the threatened flood may be averted. The glass works at Sheffield, Pa., are being rebuilt, having burned the early part of February. A more extensive plant being built which will be an improvement to Sheffield. The furniture plant now about a year old is flourishing rapidly. Farmers have not been able to do much except get wood. Potatoes about the same, $3; poultry, 35c; eggs, 39c; butter, 45c.—H. C. J., March 1.

York County, Pa.—February a wintry month. We had two big snowstorms during the month that drifted badly in some sections. The State Highway Department had a big job on hand to keep the main highways open. The county Agricultural Extension Association had planned a series of farmer's institutes for the month but a number of them had to be postponed on account of impassable roads. T. B. testing on the area plan has been almost completed in four townships. Still two more townships signed up that will be tested this spring and it is expected that one or two other townships will be able to get the necessary ninety per cent of herd owners signed up in the near future. The receipts so far have been about twenty-five per cent reactors. There are quite a few public sales of farm stock and implements being held in county. Prices received vary a good deal with the quality of goods sold. For instance, at a recent sale one horse sold for a little over $150 and another for $1.50. Hogs and shoats scarce and high in price. Butchers offering $14.50 live weight for fat hogs and pigs at weaning time are selling for $5@7 apiece. Wheat, $1.68 bu.; corn, 76c bu.; oats, 42c; butter, 40@50c; eggs, 24@30c; milk, $2.75 for 4 per cent test; potatoes, $2.50.—W. K., Feb. 24.

Look back . . .
then ahead

LOOK back a few years at a typical corn state . . Indiana.

In 1920 her farmers used less than 3½ thousand tons of potash . . but in 1924 they used more than 8½ thousand tons of actual potash in their fertilizers.

Indiana is progressive. Her increasing use of potash is due to progressive farming methods . . more intensive cropping . . proper maintenance of soil fertility.

Look ahead . . are you maintaining the fertility of your soil? Are you keeping in line with other progressive farmers?

Do your small grains lodge . . do you fail to get a clover . . is your corn chaffy? If so, the percentage of potash in your fertilizer could be profitably increased.

Give more attention to the productivity of your soil . . a slight increase in your use of potash may mean a big increase in your profit.

In 1920

Indiana farmers used 25,129.73 tons of available phosphoric acid and 3,462.31 tons of actual potash. This averages 7.3 tons of phosphoric acid to every ton of potash. The chart above shows the comparison.

In 1924

Farmers in the same State used 29,379.70 tons of available phosphoric acid and 8,788.50 tons of actual potash. Note how potash increased—one ton to every 3.3 tons of phosphoric acid—the use of potash was more than doubled.

Please send me a free copy of the useful booklet "Hints For Profitable Corn Growing" which you have prepared for corn growers.

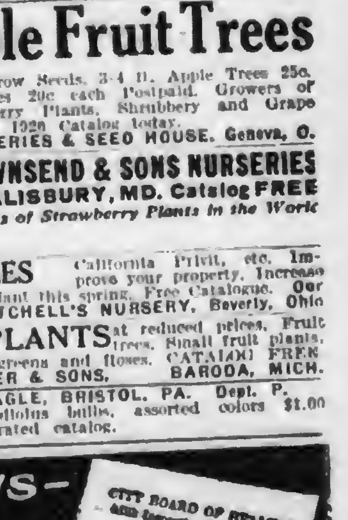
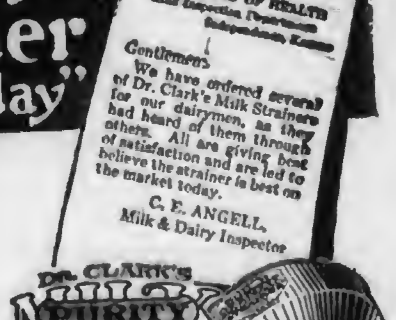
Dairy Inspector Says—
"Purity Strainer
Is Best On Market Today"



CITY BOARD OF HEALTH
AND Inspection Department
Independence, Kansas

Gentlemen:
We have ordered several of Dr. Clark's Milk Strainers for our dairymen, as they had heard of them through others. All are giving best of satisfaction and are led to believe the strainer is best on the market today.
C. E. ANGELL,
Milk & Dairy Inspector

Dr. Clark's Purity Strainer is endorsed by thousands of users as the best for removing all dirt and sediment from milk. It is the only strainer on the market guaranteed to remove ALL the dirt,—or your money back. Thousands in use by dairies, creameries, condensaries and farmers everywhere. Simple to use and easy to clean. Makes possible top notch prices for clean milk. Grade "A" tests are common with users of Purity Strainers.



Made in two sizes—10 quart and 18 quart. Ask your dealer. If he can't supply you, write direct for descriptive folder and prices, giving your dealer's name.

Purity Cotton Discs are made in any size from 5½ in. to 7 in. diameter, for all makes of strainers or filters. Send for trial order.

HILLPOT Quality BABY CHICKS

Their Quality Means Your Profit!

When I specify quality as the first thing my chicks must have, it is because I know only a quality chick can pay the real profits you should get from every chick investment.

You can see that quality in every sturdy, vigorous Hillpot Chick.

It means Ease of Raising, Early Maturity, Heavy Laying, Winter Eggs—PROFITS.

You are not taking my word for this. These results have been secured by hundreds of my customers who re-order from me year after year, because my Hillpot Quality Chicks are paying—have always paid—them profits.

Send for my '26 Chick Book. Tells all about my profit strains of
Leghorns, Reds, Rocks, Wyandottes
Since old customers take so much of my production it will pay you to ACT PROMPTLY.
SAFE DELIVERY OF FULL COUNT GUARANTEED
W. F. HILLPOT, Box 28, Frenchtown, N. J.

LAWRENCE P. UHL

THE OLDEST AND LARGEST INDIVIDUALLY OWNED AND OPERATED HATCHERY IN OHIO.

I am a PIONEER in the Baby Chick business. For 20 odd years I have been producing high class Baby Chicks which have gone out to thousands of Poultry people of America and proven highly satisfactory. For years previous to 1919, (when he retired), I was associated with M. Uhl, New Washington, Ohio, who was Father and originator of the Baby Chick business in Ohio making the first shipment of Baby Chicks 25 or more years ago. Since 1919 my output has been entirely taken by dealers who supplied a long line of year after year customers. I have decided to give the GENERAL PUBLIC an opportunity to buy my high class Chicks direct, from the Hatchery here at New Washington and I am in a position to furnish these excellent Chicks in almost any quantity and on short notice at the following prices:

For quick action, you can order, from this advertisement in perfect safety. Reference: Farmers State Bank. Duns or Bradstreet. Or get our free Catalog and further details as to prices on Chicks. Write your exact wants at once if you cannot make up your order from this price list. I want your business this season and you may rest assured that we will take care of you RIGHT.

100% Live Delivery Postpaid. Prices on	50	100	500

AMERICAN SHEET AND TIN PLATE COMPANY, Pittsburgh, Pa.

Prices and Prospects

LOWER retail prices for eggs in New York created a good demand during the early part of the week ending March 3, but toward the close the market weakened. The quality of much of the nearby stock is not so good as the best stock is going to the incubators.

The Philadelphia market has been unsettled and prices declined. The better grades met a good outlet at the lower prices. Egg receipts in Philadelphia during this period totaled 33,227 cases, of which number Pennsylvania furnished 2809.

The live poultry market in New York was irregular. Fowl were firm toward the close of the week and chickens were also in demand. Broilers were scarce while ducks and geese sold well. Live poultry was firm and stronger in Philadelphia toward the close of the week and buyers were absorbing the limited supplies of good stock.

Wheat prices declined during the week ending February 27, as a result of weakness in the foreign markets and reports of the favorable winter wheat crop in the United States. The corn market held firm with light offerings. Poor roads restricted the movement in some sections and favorable prices for livestock are keeping more corn on the farm. Oats market was firm while the rye future market declined.

Hay Offerings Light

Offerings of desirable grades of hay were light on the markets during the week but receipts of ordinary hay were plentiful and prices were forced down. Mild weather has curtailed farm feeding and made more hay available for market. Timothy averaged weaker. Low grades were almost unsalable at Pittsburgh and an oversupply of ordinary hay at Cincinnati forced prices downward. The best grades held steady at Boston but dealers were shading prices on ordinary hay.

Trading on the Boston wool market continued quiet thru the week ending March 2nd. Domestic fleece wools have been very quiet in all lines. The market has been slow with a weaker tendency.

The potato markets were generally dull during the week ending March 3 and supplies were more than ample for the demand. Prices on Pennsylvania round whites declined in practically all of the eastern markets. This stock sold at $6.25 per 150-pound sack, on Wednesday and similar stock brought $6.25 to $6.50 in Pittsburgh.

Bucks County Potatoes High

Altho the majority of the Pennsylvania potatoes have declined in Philadelphia there have been small lots of fancy Bucks County stock that have sold as high as $5.00 per 100-pound sack. During February 488 cars of potatoes were unloaded in Philadelphia. There were 239 of these that came from Maine, 153 from Pennsylvania and 57 from New York. The total potato shipments from the leading late producing states up to March 1 totaled about 128,000 cars, compared with 130,344 for the same period last year.

The apple markets have been generally slow and dull. Supplies in Philadelphia have been liberal and there has been considerable overripe and poor stock on the market. Fancy fruit has met a fair demand at good prices but the poorer stock sold at very low figures.

With many of the apples in storage not keeping as well as expected there has been a tendency to move the questionable stock and keep the best fruit for later markets. Some take a pessimistic view of the apple situation since storage holdings are much heavier than last year. Most dealers, however, are still hopeful concerning spring prices and feel that the market will improve.—W. R. Whitacre.

CIDER Sells Undergrades —At Big Profits—

THE wise orchardist of today depends as much on his cider production for profits as upon his grade A fruit. Cider—pure, sweet and sparkling—is now in great and growing demand, and offers the sure way to a PROFIT-MARKET for undergrade apples.

Mount Gilead HYDRAULIC CIDER PRESSES

Have led the field in cider making for more than fifty years. Ruggedly built for years of dependable service, they press the greatest possible amount of juice from your fruit and assure you thoroughly efficient, trouble-free operation—always. They range in capacity from 80 bushels of apples per day to the largest custom sizes that press 1,500 bushels per day, and include roadside, orchard and custom presses.

The Mount Gilead Process

Is a recently developed Process for refining and bottling all kinds of fruit juices. It produces a pure, delicious juice that remains sweet indefinitely without the use of any preservatives or other adulterants.

Write us today for our interesting book "A Golden Harvest from Undergrade Apples." Contains complete descriptions of Mount Gilead Hydraulic Cider Presses and the Mount Gilead Process.

THE HYDRAULIC PRESS MFG. CO.

Veterinary

Conducted by Dr. J. F. Shigley

Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We invite readers to make use of this service. Clippings from the column when properly preserved and classified, make one of the most valuable medical symposiums a farmer-stockman can obtain.

COW IS STIFF.—I bought a cow last April, four years old with calf by side, and drove her about six miles. She was very wild and ran most of the way. Right afterwards she seemed to get stiff in all four legs. She would not lie down in the barn. I thought she would get better when out in pasture but she is getting worse. She is losing the power of her hindquarters and hock is swollen.—J. H. B., Seelyville, Pa. While it may be true the running of the cow at the time of purchase may enter into this case, it seems rather certain that there is a question of ration involved. Quite likely this animal does not have a completely balanced ration, especially as she is a high producer. As a means of treatment would advise you to give cod liver oil in two-ounce doses until at least a quart is given. Provide plenty of good clean clover or alfalfa hay and give the animal free access to a mixture of four parts bone meal to one part salt.

COW SEEMS STIFF.—A quite large cow, which I own, became stiff in her back before freshening last April and is still so. She has been and is normal in every other respect. This may have been caused from being caught out in cold showers, as near as I can guess. Sometime last summer or early fall you named a remedy to some one whose cow seemed exactly like mine. Neglecting to put this issue of Pennsylvania Farmer up, I lost it. I shall appreciate it, if you can help restore the cow to normal.—J. W. F., Hadley, Pa. This condition may be a permanent one and not respond to treatment. One might use one dram doses of potassium iodide daily in the grain for two weeks. This ration should be well balanced and sufficient to take care of the physical condition of the animal for milk production. Alfalfa hay might well be a part of the diet. Frequently this trouble will not respond to treatment.

COWS FAIL TO BREED.—I have two cows that lost their calves. I had a doctor take the calf of one, it was dead. Now, can I get these cows to breed again? They come in heat about every three weeks and act crazy. The first calf came in October, the other in December. These cows got hurt; they didn't calve from abortion.—R. W. C., Chambersburg, Pa. The changes that have occurred in these animals that involve the reproductive tract can only be determined by an examination by a veterinarian having experience in treating the reproductive organs. There is no stock food or tonic that would aid you except as it relates to the maintainence of the herd in the best physical condition. Would advise a physical examination of these cows.

KNUCKLING.—Will you please advise me what to do for one of my horses which is starting to knuckle behind. He stands knuckling in the stable but does not seem to do it when he is out working.—J. E. K., Harrisburg, Pa. This condition is usually seen in aged horses, in horses in poor physical condition or in horses that have worked hard. There is apparently no cure. Sometimes the use of a bandage, bathing with warm water, or the use of a liniment, may help.

CRIBBING.—I have a mare coming nine years old in spring. Late last summer she began to crib. Could there be something wrong with her teeth that would cause it. She is in good flesh and seems well.—G. W. B., Canton, Pa. Cribbing in horses is a habit usually developed during idleness. While her teeth may be examined, it is doubtful that this has anything to do with the case. Regularity of exercise and a well balanced diet may relieve the tendency to crib but there is no specific cure.

Our Readers' Classified Advertising Department

A market place to buy or sell at little expense. Over 90,000 farm families read Pennsylvania Farmer every week. Rate 6 cents a word each for one, two or three consecutive weekly insertions; 5 cents a word each for four or more insertions. Count each number and initial and send cash with order. Orders, discontinuances or changes of copy must reach us by Wednesday of week preceding date of issue. All advertisements set in uniform style, no display type or illustrations. Poultry advertising may run here, but if displayed or illustrations used must run in display advertising columns at commercial advertising rate (55 cents per agate line). Livestock advertising not accepted in this department. Minimum, ten words.

DOGS

ENGLISH SHEPHERD PUPS

Intelligence unsurpassed, with life, grit, courage. Natural heel drivers. Guaranteed. W. W. NORTON, Ogdensburg, N. Y.

PEDIGREED COLLIE PUPS—The handsome and intelligent kind. Also, Fox Terriers. LONDON KENNELS, Box No. 37, Grove City, Pa.

FINE Shepherd watch dog, $17; female Black and White cow dog, $15. Pups $5. Beagles, trained $15. GOLDSBORO GOATERY, MOHNTON, PA.

Our Baltimore House

Do Your Shopping In This Big Baltimore House

If this big Baltimore House of Ward's were just around the corner from your home—where would you do your shopping?

Yet that is almost true. Your Catalogue enables you to visit, to see every room in this big building, to note the price of every piece of merchandise, to shop at will for everything you need.

Do you really *use* your Catalogue? Study each page just as you would visit each merchandise room in this big building.

$50 Can Be Your Saving This Season

Just consider that $60,000,000 in cash was used in buying the merchandise for your Catalogue. Think of this vast buying power at work for you—to make low prices for you, not only on tires, or furniture, or clothes, but on almost *everything* you buy.

Every time you look at your Catalogue, remember that you and 8,000,000 other customers made this all possible. That together you have given us the buying power to secure these low prices for you. Such is the advantage of your cooperative buying, all together, through Montgomery Ward & Co.

"Ward Quality" Assures Lasting Satisfaction

We try to buy only goods of standard quality. We make low prices by big buying for cash. We do not cut quality. We never sacrifice your satisfaction or the wear any article will give in order to quote a low price.

It is easy to make a low price by sacrificing quality. It takes millions in cash, and a complete buying organization to visit every market in America and Europe, to enable us to quote these low prices—*and maintain Ward Quality.*

These are the facts to consider when you look through your Catalogue. These are the reasons why you should turn to your Catalogue for everything you need to buy. The Catalogue brings you the opportunity for saving. This big, convenient Baltimore House is ready to serve you quickly. There is a saving this season of at least $50 in cash for you—if you use your Catalogue—and send all your orders to Ward's.

Your orders are shipped within 24 hours

Your orders will be shipped within 24 hours. That saves time. Our big Baltimore House is near to you. Your letter reaches us quicker. Your goods go to you quicker. It is quicker and cheaper, and more satisfactory to send all your orders to Ward's.

AMCO

THIS announcement is of vital interest to every man who feeds livestock.

As AMCO FEED MIXING SERVICE, the American Milling Company offers to contract direct with community groups of farmers to purchase and mix for them College Feed Conference Board feeds; *except* where contracts are already in existence with state-wide agencies and in the territory served by the Cooperative G. L. F. Exchange. (This Cooperative leases a plant from the American Milling Company and will pool its buying with Amco Feed Mixing Service.)

This plan makes immediately available to the smallest feeder in the smallest community feeds mixed according to the standards set by the Colleges of Agriculture.

Cost of ingredients for these feeds will reflect the enormous joint purchasing power of the American Milling Company and the G. L. F. Exchange; mixing costs will be based on the volume operation of the *largest and most efficient* feed mixing plant in the world. Order-getting costs, already established at a low figure, will automatically reduce as volume grows.

Under the terms of the contract which is offered, monthly prices will be announced on the twenty-fifth of each month for the succeeding month's delivery. These prices will not exceed the market cost of ingredients on the date issued, plus the mixing and order-getting costs, and will be as much below market as large volume and skillful buying can make them.

The Adams County Baby Beef Club

What Was Back of the Fine Showing Made by These Boys and Girls at Harrisburg

By R. E. UNDERWOOD,
County Agent, Adams County, Pennsylvania

THE Adams County Baby Beef Club was organized in March and April, 1925, as a project of the Adams County Agricultural Extension Association. Community leaders in every one of the thirteen communities helped in interesting those boys and girls of their community who would feed a Hereford calf in this club.

We had three objects in starting this club, namely:

1. To demonstrate the value of purebred Hereford steer calves as economical beef machines.

2. To demonstrate principles of good management in feeding and to impart a fair knowledge of the principles underlying baby beef production and of the challenge it offers for progress and improvement.

3. To develop in Adams County more square miles of happiness by the development of the hands to be helpful, skillful and useful; of the head for the power to think, plan and reason; of the health in order to be able to enjoy life, resist disease and make for efficiency; and of the heart, to become more helpful, kind, sympathetic and true.

This project was started at the time of planning the year's program of work in each community. Our goal for enrollment was set at fifty members. Any farm boy or girl eleven to twenty years of age could become a member by signing a regular form card and turning it in to the county agent. With the good work of the project leaders we had forty-three boys and eleven girls signed up by April 15th.

Original Plan Changed

Our original plan had been to buy calves weighing around 400 to 450 pounds, and costing approximately $48 per head, from Hereford herds in Pennsylvania, but with fifty-four boys and girls signed up and enrolled and waiting to get started by May 1st, we were forced to go to a bigger source of supply.

Katharine Durboraw (left), who won the Pennsylvania Farmer cup, and her sister. The photograph was taken in August.

Consequently P. T. Brown, then beef cattle specialist at the Pennsylvania State College, learned that calves of the weight and quality demanded could be purchased in Kansas City. Mr. Brown went to Kansas City and bought eighty calves, which were selected out of a bunch of 400 just unloaded from the range.

These calves cost at Kansas City around $9.00 per 100 pounds, their average weight on May 7, 1925, being 496 pounds.

The calves arrived at Gettysburg May 13 and after a fill of hay and water were weighed individually and numbered. Each boy and girl drew lots for the order of drawing, and then drew for his or her Hereford calf, and paid for same. The commission fee, vaccination for shipping fever, two feeds, and freight were prorated over the entire weight of all the calves.

Bought by Carload and Reduced Expenses

Twenty-six of the eighty calves were bought for a local stock dealer. Having bought eighty, making two minimum carloads, the expenses from Kansas City to Gettysburg were reduced about $2.67 per head. The initial cost of the calves at Gettysburg with around thirty pounds shrinkage per calf, was $10.70 per 100 pounds. On May 14, fifty-four boys and girls took their calves home and the first lesson learned was that the calves were both strong and wild.

Most club members pastured their calves from May until August, with a gradual increase in grain, but several started to stall feed immediately. Those who took advantage of pasture up until fly time, probably made more economical gains, and had their calves "cooled out" and thriving when time came for confining and getting on full feed. On pasture the general ration fed was: corn, one-third; oats, one-third; bran and oil meal, one-third. This was changed gradually after August 1 to corn, one-half; oats, one-quarter; and bran, oil meal and cottonseed, one-quarter. The boys and girls were instructed on varieties of feed and balanced rations, but each club member studied the appetite and likes and dislikes of his pet for different combinations of feed and fed accordingly.

Very few calves were forced off feed, and attention to little details and enthusiasm carried forty-nine out of the fifty-four to the round-up at the State Farm Products Show at Harrisburg, after a 250-day feeding period, weighing an average of 903 pounds, or an average gain of 435 pounds per calf.

One feature of the educational work that has been the basic object of having such a club, has been the instilling into the boys and girls, their parents, and community leaders that purebred Hereford calves as baby beef sell well; are much more economical feeders and have a greater ability to turn pasture and other feed into beef.

The saying that the proof of the pudding lies in the eating was well substantiated when at the auction at Harrisburg, packers and local butchers bid these calves in at an average of $13.48 per 100 pounds for forty-nine head.

This made it possible for every one but two club members at the round-up to make a profit above feed cost, regardless of prize money awarded. Briefly summarized the results are as follows:

Avge. weight at start, May 14, 1925....	478 lbs.
Avge. weight at round-up, Jan. 22, 1926	903 lbs.
Days fed	251
Average total gain	435 lbs.
Average daily gain	1.72 lb.
Average total feed cost..............	$44.73
Average purchase price of steer....... or $10.20 per 100 lbs. at Gettysburg.	$50.26
Average cost of feed and steer	$94.99
Average selling price of steer......... or $13.48 per 100 lbs.	$121.72
Return above purchase price and feed cost.	$26.73

In addition to this each calf was insured for the entire feeding period with the Hartford Livestock Insurance Company at a cost of $4.00 per $50, the value placed on each calf.

In most cases when boys and girls did not have money of their own to put into a calf, local bankers loaned them the money at the regular rate of interest with approved security.

Including halters at $2.50 each, freight to Harrisburg, sale charge of $1.00 per head, and insurance, the miscellaneous expenses to the extent of $10 each would decrease the average return above cost to $16.72.

Besides caring for the board and lodging of the club at Harrisburg the State Show Committee provided $300 in money for prizes. The American Hereford Breeders' Association contributed $100 and $80 was given by eleven banks in Adams County.

The $500 prize money was awarded as follows: $50 first prize, $40, $30, $25, $20, $15, $10, next fifteen places $10 each, last twenty-seven places $5 each. Basis of award was as follows: Fifty per cent on individual merit—animals were scored according to the position they placed in the ring; forty per cent on daily gain; ten per cent on records kept.

Average Daily Gain for Club

The average daily gain for the entire club was 1.72 pounds per day, the rate of daily gain changed the results somewhat. In one particular instance the calf of Donald Curns, which made a daily gain of 2.44 pounds per day brought this calf from sixteenth place to ninth place.

In addition to this a silver cup for the boy or girl best fitting and showing his or her animal was given by Pennsylvania Farmer. A silver cup for the greatest daily gain was given by the Gettysburg Times and News Publishing Company, and a silver cup given by the Gettysburg Rotary Club for the best calf shown by a boy or girl within the group sponsored by them.

Assisted by the beef cattle specialist, Mr. Brown, Mr. Vail, from the Pennsylvania State College, and Mr. Barnhart, assistant state club leader, visited each member of the club several times during this feeding period, and gave technical help.

A Chance Given to Visit Others

In addition the club was divided into three groups and on three successive Saturdays in September tours were made by each group. In this way an opportunity was given for beef club members to see what each calf was doing and to get acquainted with the other boys and girls. It also gave parents, sponsors and local leaders a chance to see that sometimes the grass grows greenest across the fence. And we know the change of pasture was beneficial to all who took part in many of these phases of the baby beef project.

In May a judging contest was held for members of the club and the winners represented the county in the inter-county general livestock judging contest, during Young Farmers' Week at State College. The team won fourth place in this contest and we can say the members acquitted themselves nobly.

The beef club work has resulted in the strengthening of agricultural extension work in the county. The enthusiasm of sponsors, business men, community leaders and parents, bids fair to help make for a better understanding between farmers and business men.

Carbon trouble in your Ford can be a rarity!

DID you ever stop to think that there are little bonfires of fuel and oil in your engine when it is operating? Drop by drop the lubricating oil is thrust up by the rings. It may encounter a heat of 2000° F. to 3000° F. in the combustion chambers.

Naturally, each bonfire leaves a little carbon. But if your engine is operating properly and the oil is *suitable*, the carbon will blow out the exhaust pipe.

To minimize carbon in your Ford or Fordson engine, four factors are important:

1. Avoid too rich a mixture of gasoline or kerosene.
2. Avoid unnecessary idling.
3. Avoid carrying the oil at a level higher than the upper pet-cock.
4. Use only an oil of the highest quality whose body and character are scientifically correct for the Ford or Fordson engine.

An economical demonstration—

Mobiloil "E" is the Vacuum Oil Company's specialized oil for Ford engines. Their oil for Fordsons is Mobiloil "BB" in summer, and "A" in winter.

For economy's sake, why not try a crankcase of the correct grades of Mobiloil in your Ford and Fordson? A week's use of Mobiloil will show you how it conserves power and adds to smooth running. And as the weeks become months, your new freedom from carbon will prove a big comfort to your pocketbook.

Vacuum Oil Company, branches in principal cities. Address: New York, Chicago, Kansas City or Minneapolis.

NESHAMINY GARDENS

Where an Editor Works and Thinks

By R. P. KESTER

THE number of letters received asking for advice indicates that there are a great number of people uncertain as to what they should do to better their condition. Advice is a dangerous thing to hand out to a stranger,—dangerous for both the giver and the receiver. Usually, the people who most need advice don't ask for it and will not follow it when offered. However, there are many men and women who long for a farm and life in the country, but whose family demands are so insistent that they hesitate to make the move fearing that they may lose what they have and also the position which is furnishing them a living now.

✚ ✚ ✚

THE following letter is typical of those received from the class mentioned:

"I am a reader of the good Pennsylvania Farmer and would like to get some advice from you. I am forty-four years of age and have nine children ranging from three to twenty years old. I would like to buy a farm, or a few acres and a store. Would you please tell me what would be the best and where? Would it be best to go on a big farm, or get a small farm to run in connection with other business? I was born and raised on a farm until I was twenty-five years of age and now would like to go back, and so would my children. Let me know if I have enough money to start in either of the lines mentioned. Would it be best close to town with a small acreage, or back farther with a larger acreage? Which state would be the best?—An Allegheny Countian.

✚ ✚ ✚

HERE is a man with many advantages in his favor for making a success of some branch of farming. First, he has the age which should make him cautious and thoughtful. The fact that he is raising so large a family shows that he is industrious and frugal. The children, if they prove to have a liking for farming, would be of incalculable assistance in conducting a farm. He has an inclination for the work, knowing what it is like, and also has enough money to make a start, if wisely used. Now for the specific questions.

One piece of advice it is usually safe to give is, Don't go into storekeeping. The writer does not say what he has been doing for the last twenty years, but keep this fact in mind: Statistics show that ninety-five per cent of beginners in storekeeping fail within ten years. Another safe "don't" is, Don't try to ride two horses at once. Any line of farm work, to be successful, requires all the time, brains and energy the average man possesses.

I do not believe it would be necessary for the inquirer to go far from home to find a suitable place. The vicinity of Pittsburgh has many examples of successful farming in all branches. The immense consuming population of that district makes a good market for all kinds of farm products,—dairy, poultry, fruit, truck garden, etc. The first consideration should be good, hard roads. Given these it does not much matter in these days whether a farm is three or thirty miles or even more from a city. It takes several years to start a fruit farm, unless truck, small fruits or poultry, or all three, are raised until the trees come into bearing. If grain farming and stock raising or dairying are engaged in, go still farther from the city where land is cheaper. But see the roads.

Keep a part of the $3000 for stock and implements and pay the balance on the purchase price. A satisfactory loan can usually be secured on a likely farm if part of the price is paid.

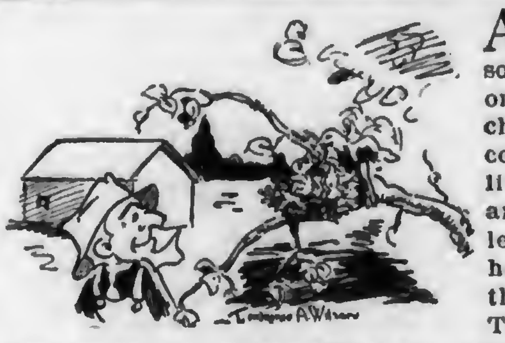
I know one man with a large family who quit the railroad shops ten or twelve years ago and started strawberry growing and truck raising in Mifflin County. This man has made a notable success and is a leader among Pennsylvania growers today, altho he knew little or nothing about such work when he began. He had the determination to succeed and the willingness to study and work, and also the loyal support of his wife and children. The personal fitness of the people who make the attempt is after all the deciding factor in such cases. If the Allegheny County man and his family have the qualities of the Mifflin County example I will say, "go ahead." But mind that "if."

✚ ✚ ✚

WE ARE just now trying to get all the information possible on the question of dusting vs. spraying to control melon diseases. Has anyone tried it out fully, and was it a success? If dust will control melon blight and insects it will be a boon to melon growers because spraying is something of a difficult job after the vines cover the ground. Any information will be gratefully received but we are going to try it out anyway.

THE CHEERFUL PLOWMAN

Misplaced Credit



A PAIR of birds—it matters not the color, size, or kind—last season built a little home, as nice as one could find, and there in my old cherry tree they lived as cozy as could be! They hatched a nest of little birds, a male quartet, I know, and under their parental care these learned to chirp and grow; a fairer home I've never seen than that thatched cottage done in green! They ate my cherries by the score, they helped themselves with zest,—without good food there is no home in either house or nest—but tho my cherries were their fare I gladly left them living there.

"I may have here a just complaint," I told myself of course, "I might be justified indeed in using brutal force, but be their actions right or wrong I'll trust for pay some day in song!" I left them there to eat and grow, to live their happy life, and tho I knew my normal rights I made no fuss or strife,—but picture my chagrin one day to find they all had flown away! Imagine how I felt to learn they all had moved along and had not proffered me as pay a single note of song; I gave them credit day by day; they left by night and didn't pay!

"Next year," I thought, "two honest birds may seek my cherry tree, two birds who pay their honest debts may ask some aid of me, but with this lesson in my mind dare I be sure, dare I be kind? If those two birds had tried to pay who nested here this year then I might help another pair without a tinge of fear, but as a sane and careful man dare I resume this credit plan?"—J. Edw. Tufft.

Guard Against Fires

A NEIGHBOR'S house recently burned and with it a small child. The cause was the boiling over and exploding of a pail of oil drawn from a tractor and set on the stove to warm.

Since the fire I have found that many people are in the habit of doing this to make the starting of cars or tractors easier. It is a dangerous practice and should not be done. Many fires are bound to happen if all precaution is used and it surely pays to take every precaution.

Farm people should have fire escapes on their houses so that people who are on the second floor and are unable to use the stairs will have another way to get out. Even when fire companies from nearby cities respond they are usually useless as there is no water.

House Burned in Fifteen Minutes

This house was a large house finished on the outside but having temporary paper partitions. The whole house burned to the ground in fifteen minutes.

A friend's house burned last fall. This was a well made house built years ago of great beams and lathe and plaster. The cause was unknown but in a half hour, from the time it was discovered, it was in ashes. It burned in the daytime, no one being in the house but the housewife and she barely escaped, her hair being singed. If it had occurred in the night, the chances are they would all have been burned.

When I was younger I laughed at those who were afraid of fire. Now it frightens me to see people who are unafraid of fire. Better be laughed at for being afraid than sorry because you have been careless.—Mrs. E. M. C.

Be Sure of the Seed

ENOUGH tests have now been made by the seed laboratory at the New York Experiment Station at Geneva to show that the stocks of seed corn need special attention this season if corn growers are to escape serious losses from the use of poor seed, declares the state seed analyst. Germination tests have been made which give results varying all the way from 100 per cent germination down to 0. Some lots of seed corn which were selected after freezing weather set in last fall, even where fire dried, are giving low tests. Seed corn gathered after freezing is not safe to use unless single ear tests are made to weed out the dead ears.

Some lots of 1924 seed corn show better germination than many 1925 lots. Since it is usually the more careful farmers who send samples for testing this early in the season, it is believed that the situation will be found to be rather serious as the season advances.

There is no reason for New York corn growers to become unduly excited or to pay exorbitant prices for seed corn, it is said, but they are urged to ascertain at once the condition of their seed corn.

A Promise Fulfilled

To carry through one of the greatest expansion programs in automobile history, Dodge Brothers, Inc. invested more than $10,000,000 in new buildings and advanced new equipment.

Remarkable new mechanical processes were perfected, making it possible, in many instances, for one machine to do the work formerly done by six, eight and ten machines—and do it better.

Making it possible, too, for one man more quickly and accurately to do the work of many. And clearing large areas of factory space for greater output.

Tremendous increases in production have followed. Vast economies have followed. Finer precision in craftsmanship has followed. Vital improvements in Dodge Brothers Motor Car have followed—and, as promised, astonishingly low new prices made possible by these gigantic developments.

Your share in this great investment is the money you save by purchasing, *at the lowest price*, the finest vehicle ever produced by Dodge Brothers.

OUR JOB is to serve our readers. Whenever you are puzzled write to us and we will help you if we can.

"Some men never find the key to success, because they don't look in the right place—inside their own minds."

Work Horses Wisely

A WORD of caution concerning horses is usually not out of place as the time for starting farm work approaches. Every year many horses are incapacitated for several days or weeks by overwork during the first warm days of spring. Idleness during the winter months makes the muscles soft and unable to withstand continued effort such as the rush of work often suggests to the driver. Shoulders are galled and bruised, often requiring months to heal. Overheated horses are allowed to drink too freely of cold water, causing "founder" which often has permanent and sometimes fatal results.

The Increase in Farms

WHEN noting the increase in the number of farms in the northeastern states it should be borne in mind that a different basis for counting was used in the 1925 census than was used in the census of 1920. Last year all tracts containing three acres, and on which $250 worth of products were raised were listed as farms. The number of such places has been increasing rapidly during the past five years. The desire to get out of the congested cities has been met by the automobile and the building of good roads, so that thousands now live on little "farms," raise some fruit, poultry and vegetables and travel back and forth to work in the cities. In the strict sense of the word no increase in the number of farms has occurred, but the listing of the small home tracts as such has made an apparent increase.

The Cause of High Taxes

AT LAST we have found out why rural taxes are higher than they were a few years ago. A writer from a strictly rural community tells us that before prohibition went into effect they had always had a saloon opposite the store at the cross roads. That saloon paid an annual tax of one hundred dollars! Since it was put out of business the taxes on the farms of that neighborhood have been increased fifty per cent. Of course we do not know, since he did not explain, how many dollars the people of the neighborhood spent at the saloon in order to get back one hundred dollars. We make a conservative guess that it was about ten to one.

The Holstein-Friesian Case

A FEW weeks ago some Pennsylvania cattle whose owners had listed them with the recently organized Holstein-Friesian Registry Association were condemned as tubercular. Immediately the State Secretary of Agriculture was called upon to decide whether these cattle were really "registered," in the sense meant by the law that provides a higher indemnity for registered than for unregistered animals.

When the law used the word "registered," did it mean only those animals registered in the old-established herd associations which existed when the law was passed?

Secretary of Agriculture Willits called a hearing to get all the facts before making his decision. The officers and lawyers of the new and the old Holstein associations argued for and against the recognition of the new registry organization which was set up in Harrisburg a few months ago.

The new association maintained that the Secretary of Agriculture was bound by the law to authorize the payment of the higher indemnity for condemned animals registered in any registry association where reasonable precautions were taken against fraud,—even if only a half dozen farmers got together and called themselves a registry association and "registered" those of their animals whose ancestry could properly be traced back to the old herdbooks of the old parent organization.

The old Holstein-Friesian Association of America held that the formation of even one additional registry organization would open the way to fraud and confusion. It maintained that, even tho the new body based its registry on the records in the old herdbooks, —which it does,—it could not protect itself against fraud without the unpublished records and the long experience of the old association.

The Secretary of Agriculture is concerned only in knowing whether the records published by the inexperienced Harrisburg body are to be relied upon. However, thousands of breeders wish that he could take into consideration several other factors,—the endless confusion and fraud that can be brought upon farmers by the existence of two registry associations within the same breed; the opening of the way for the establishment of a dozen, or a hundred, divisions in the ranks of Holstein breeders. It is an unpleasant picture.

The Farmer in Congress

THE New York Journal of Commerce, after saying that farmers are having a greater influence upon official Washington just now than anybody else, closes an editorial in these words:

"The pity of it all is that despite this tender solicitation expressed for the farmer, not one constructive move has been seriously initiated at the national capital in behalf of the rural districts devoted to agriculture. Not even the self-styled representatives of the agricultural industry themselves are now any more able than they have been all along to come to any substantial agreement among themselves as to just what ought to be done. Similarly discouraging is the fact that so long as excessive tariff policies, ridiculous immigration restrictions and the like are insisted upon not only will little be done to aid the farmer but, in fact, little can be done that would be of very great advantage to him. The essential truth of this statement is so obvious that it is indeed difficult to understand why the farmer himself has not long ago arrived at the conclusion that he has very few real friends at Washington and proceeded to do a little housecleaning at election time. The whole situation would be more encouraging if there were any indications that he had such plans for this autumn."

Honesty in Advertising

WE HAVE been struck in comparing modern catalogs of all kinds of goods with those of a generation ago, as we remember them. The old-time use of extravagant language is seldom seen. The leading firms in every line, while using their strongest arguments, make an effort to convince by stating the simple truth in the simplest manner. Nursery and seed catalogs which used to say of every variety that it was the "best grown," now try to give the facts as they really show up in the field and garden. However, it is still possible to be misled as there are enough unscrupulous people in the world to keep going some of the old-time practices in spite of protective laws and the general upward trend in business morals. Pennsylvania Farmer takes pride in the success of its efforts to keep the latter kind out of its columns.

A Great Secret

THE plot thickens!

Men are scurrying here and there, entering secret rooms, avoiding reporters, making cryptic remarks.

A handful of secretive gentlemen may gather today in Philadelphia; tomorrow it may be Atlantic City; the next day Tampa, Florida; then, again, it may be in Washington. Strange rumors fill the air one hour, only to be denied the next.

Somebody tells someone something somewhere and it is pronounced later to have been pure speculation. The public stands back,—waiting, waiting with hushed breath, until the oracles have spoken. The public is interested, even concerned, because its future welfare depends upon what these furtive men decide it shall receive. The public is anxious, yea willing, to assist in the great work at hand. But it is not asked,—not even considered.

What is the awful secret which these industrious, secretive men are trying to unravel? Why, the half dozen patriots (?) are simply trying to decide who shall be the next governor of Pennsylvania.

The Big Corn Crop

THE corn crop of 1925 was the biggest on record and its over-size was responsible for much anxiety and loss in the corn growing states and also for much political agitation in Congress. So unusual was and is the situation, and the causes which produce it, that we wonder whether it is really worth while to get excited to the point of treating it as a permanent menace to the prosperity of agriculture.

The Federal-State Crop Reporting Service finds the largest amount of corn on farms on March first on record. Forty-six per cent, or 33,337,000 bushels, of the Pennsylvania corn crop was still on farms as against about half that much on the same date last year. In the United States 45.5 per cent, or 1,318,793,000 bushels, was in the farm cribs on March first, which is almost twice as much as remained in 1925. There is little doubt that this situation will tend greatly to reduce the acreage planted this spring, and it is unlikely that the unusually favorable season we had a year ago will be repeated this year. The favorable season of 1925 made the percentage of merchantable corn the highest on record.

Washington Letter

NEW PRICE-FIXING SCHEME.—E. T. Meredith, of Iowa, proposes that on December 1 of each year, a federal board shall fix prices at which the nation will bid for certain staple farm products for the following year. With the price fixed in December, Mr. Meredith figures that the farmer would have ample time to decide what products would give him the largest return under the price fixed by the government.

DICKINSON BILL SCRAPPED.—Hearings on proposed farm relief legislation before the House Agriculture committee have held the center of interest on Capitol Hill during the past week. Spokesmen for the joint legislative committee of the American Council of Agriculture and the Corn Belt committee were given several days in which to present their case.

They came first with a blanket endorsement of the principles of the Dickinson surplus disposal bill, but differed among themselves as to details. They did not get far, however, with the House committee. The Corn Belt spokesmen were given to understand that further efforts would be useless until they were able to present a practical workable plan in detail.

Later after a conference they decided to scrap the Dickinson bill, and came back with a new proposal. It provides for the creation of a Federal Farm board, equipped with a revolving fund of $250,000,000, provided by the government, to cooperate with existing farm organizations in the disposal of the crop surplus, and contemplates the collection of an equalization fee upon the commodities as a means of stablizing prices.

UNABLE TO AGREE ON DETAILS.—Under the Dickinson bill the equalization fee would have been levied on the producers to provide a fund to offset losses in handling exports of crop surpluses. The new scheme proposes that the fund be raised thru a levy at the point of processing the raw material. The equalization tax would be collected from the manufacturer, processor or exporter, but deducted by them from the price paid the farmer.

As with the Dickinson bill the Corn Belt spokesmen are agreed on this new plan in principle, but there is still some difference of opinion as to details.

FEARS GREAT OVERPRODUCTION.—William Hirth of Missouri, representing the Corn Belt farmers, was asked by Congressman John C. Ketcham, of Michigan, if the bill such as he suggested, would not offset all of the effects of years of education looking toward orderly marketing. "In other words wouldn't it destroy all incentive to cooperation among the producers?" Mr. Ketcham feared that with the assurance that the Federal government was pledged to maintain "fair prices" for farm products farmers thruout the country would go wild in overproduction.

WANTED: A LEADER—Representatives of the National Grange, American Farm Bureau Federation and other national farm organizations have not been heard as yet. Dr. T. C. Atkeson, of the National Grange, looks upon most of these farm relief panaceas as unsound in principle with no chance of being enacted into law.

It is already plainly evident that the main trouble with the movement for farm relief is a surplus of leaders and a shortage of intelligent, forceful leadership. One spokesman armed with authority to speak for the farmers and with a comprehensive program, backed by facts and sound conclusions, would accomplish more effective results at a congressional hearing than a dozen men each determined to emphasize his own particular views.—E. E. Reynolds.

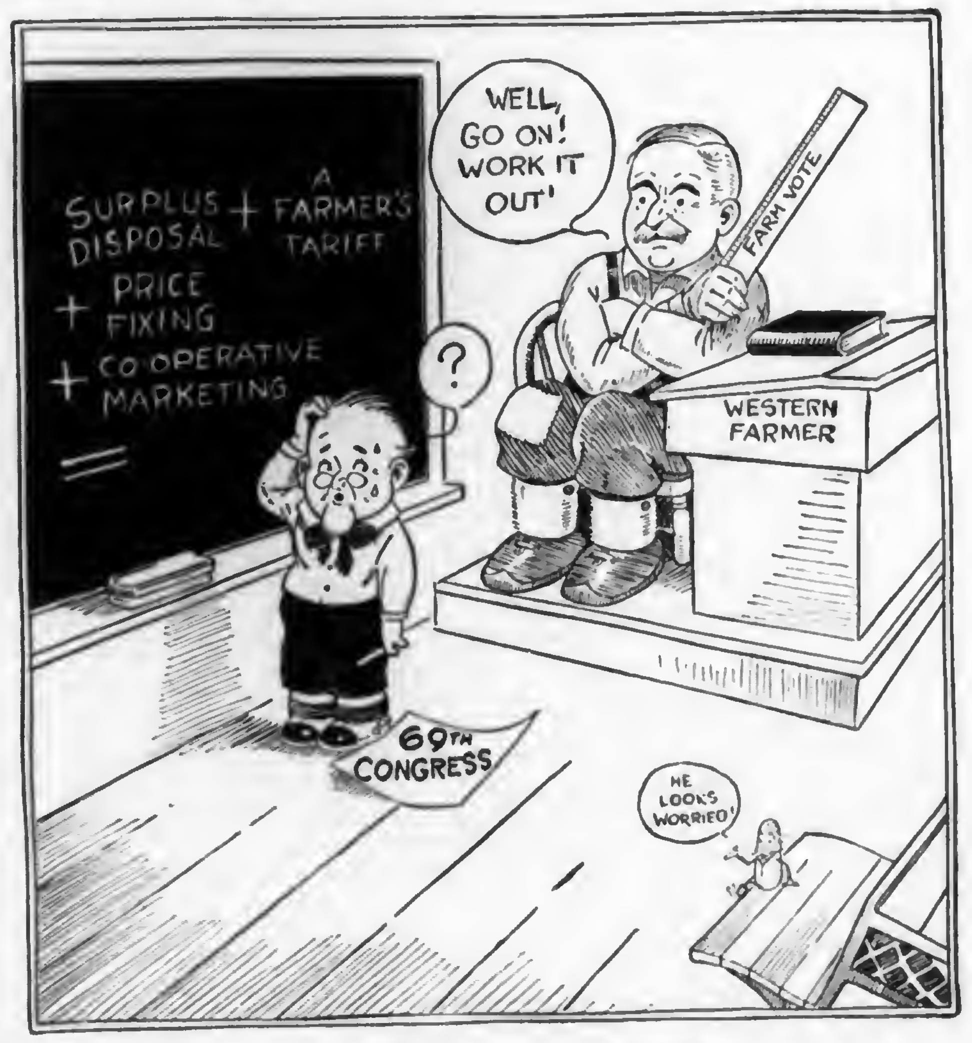
Harrisburg Letter

INTENTIONS ON CROPS.—Probably the most comprehensive inquiry ever undertaken to find out what the farmers of Pennsylvania are going to plant is now being worked out by the statistical end of the State Department of Agriculture and inside of a fortnight it is hoped to give a pretty fair statement of intentions. The figures are, of course, assembled by districts. It is also expected to show in a short time the actual conditions in regard to acreage under cultivation and the winter wheat.

RURAL RENTS.—First studies from the investigations conducted by the Department of Agriculture into what was last year termed "rural finance" or where the farmer's dollar goes, are about to be issued. One of the subjects receiving attention is rents.

AFTER TAX COSTS AGAIN.—Fighting for the reduction of costs of tax is to be resumed this spring with the idea of getting thru a bill next winter. One of the plans most generally favored aims at uniformity in methods which it is expected will bring down the costs, declared in some communities to be beyond all reason and to be a contributing factor to lack of local improvements and adequate lighting as well as poorly maintained boro streets and township roads.

LITTLE CHANCE OF RAISE.—Judging from what is being said about the State Capitol these days there is little chance of any increase in the amount of state money allotted for county share-and-share-alike road improvement or for township purposes being allowed by the next two legislatures in any event. Practically all of the proceeds of state road bond sales will be used up this year, leaving the financing of the 1927-28 program to be handled out of current revenue. The next time a road bond issue can go before the people will be 1928, when there will be so many other bond issue problems that no one can foretell what will happen.



SURPLUS DISPOSAL + A FARMER'S TARIFF + PRICE FIXING + CO-OPERATIVE MARKETING =

HE LOOKS WORRIED!

Worse than a crossword puzzle

DOG LAW APPEAL.—Notice that an appeal is to be taken to the Supreme Court to test right of owner of a dog, having taken out a license, to allow the animal to go without a collar containing the tag even tho on farm premises, has been given to the state's legal department. The case may go to the court when it sits here in May. Enforcement of the dog license law has been attended by numerous suits to compel compliance, but this is the first appeal on a matter of practice following licensing to come up.

TRUCKS USED MORE AND MORE.—In communities known for years as railroad centers, such as Harrisburg and Allentown, there are decreases noted in receipts of carlots of certain classes of farm-grown produce and corresponding increases in the number of truck loads of the same commodities furnished. Some of these involve long hauls. Local business seems to be monopolized by gasoline-driven vehicles. They are even invading the grain carrying.

BROWN-TAILED MOTH FOUND.—State nursery stock inspection authorities have acted very promptly to halt any danger of introduction of the brown-tailed moth and other pests into Pennsylvania as the result of discovery of infested trees from France. Just one nest was found, but the caterpillars were very much alive. The state inspection has been put on the alert ever since and it is believed there is no further danger.

MORE CORN HELD.—Detailed reports of the Federal-State Crop Report Service indicate over 33,000,000 bushels of corn are held on farms where grown as of March 1 and over 19,000,000 bushels of oats. The figures are considerably above the average and far beyond those for the same date in 1925.—Hamilton, Harrisburg.

New Jersey Letter

NORTH JERSEY CONFERENCE.—The regional conference of northern New Jersey County Boards of Agriculture, originally announced for Somerville on March 29, will be held at the Elks Club in Somerville on March 27th. The gathering, which is under the leadership of the New Jersey State Federation of County Boards, will open with a luncheon at 1:00 P. M. The gathering follows a conference of the southern counties in early March and is a part of the state program for discussion of the membership problem on a county quota basis. All of the presidents and executive committee members of the northern New Jersey County Boards have been invited.

ACTIVE GRANGE SEASON.—Winter meetings of subordinate and Pomona Granges have been well attended for the most part this winter. Many of the Granges have presented plays or minstrels, and other entertainment features have done much to strengthen the attendance and interest. Many candidates have been initiated during the season and total Grange membership in New Jersey is now placed at well over 20,000. Mercer County Pomona at its early March meeting objected to a state gas tax, except where a refund would be provided for gasoline used in trucks and stationary engines and if part of the money received from the gas tax be used on township roads. Practically all of the farm organizations have gone on record in favor of such a tax.

SHORTENED ROUTE TO CANHOUSES.—Monmouth County tomato growers around Freehold will be able to load their cars at C. R. R. of N. J. stations this season and have them switched directly at Freehold to the P. R. for direct transportation to the canneries at Camden. The new arrangement follows a recent conference of H. E. Taylor, secretary of the New Jersey Federation with railroad officials at Philadelphia. The new ruling saves at least a full day's run between loading points and the canhouses.

COMMITTEE ON CENTRALIZATION.—Following a conference of the committees representing twelve farmer organizations in New Jersey on March 4, a Ways and Means Committee was appointed to work out details for bringing together all farmer organizations of the state and to present a practical plan for final consideration by the various associations, at an early date. This committee is composed of J. W. Miller, New Jersey Alfalfa Association, chairman; Senator David H. Agans, Master of the New Jersey State Grange; H. B. Hancock, president of the New Jersey Federation of County Boards of Agriculture; John Hankinson, New Jersey State Horticultural Society and New Jersey State Swine Growers; Richard D. Barclay, president of the New Jersey Beekeepers' Association, and J. I. Lyle, president of the New Jersey State Poultry Association.—B.

New York Letter

RURAL HEALTH LEGISLATION.—The rural people of this state were given a hearing this week on a bill proposing to create within the State Department of Health a deputy commission of rural health. The bill is a worthy one, not too radical or drastic, and carries an appropriation of but $10,000. There are eight or nine urban divisions in the department, with no one held responsible for rural work. Consequently rural health has been sadly neglected and when queries or calls for help come in from rural sections there is no one whose special duty it is to see to them. All this would be changed under provisions of the bill. Nursing service in rural sections is deplorably poor, as well as that of physicians. There are less than 20,000 nurses in the state, with a population of 11,000,000. In some rural counties there is but one to 4943 persons. Many of the counties have no county hospital.

RURAL SCHOOL BILL.—Last year there was no public hearing on proposed rural school legislation. This year on March 16 rural people will be given a chance to express themselves on the matter of taking away the right of the State Education Department to enforce consolidation. Certain persons have kept a lobby at Albany and have demanded the withdrawal of that right and have secured the assent of many, on first thoughts. But as a matter of fact the department has very rarely used this right, and then with reluctance. Since the revision of the education law last year the commissioner of education has been petitioned to use this right as often as he has not to. As usual there is a "nigger in the woodpile." This time it is in the fact that in a few rural districts of the state there are wealthy corporation holdings of such amounts that they pay the district tax in full or nearly so. Those residents who have been favored all these years by having their school supported for them would like to preserve this to themselves for all time, instead of sharing it with others. Under the new centralized school provisions, which does not force consolidation but leaves it to the vote of the people concerned, such favored districts would lose their special advantages if centralized. Practically every farm organization stands for leaving the education law in this respect as it stands.—M. C. Feint.

Garden and Truck Crops

Beets and Carrots

I live in South Jersey and have not yet grown early bunch beets or carrots. This spring I want to grow both. Can you tell me how early to plant seeds and what varieties to use for early bunching?—G. A. L., Gloucester County, N. J.

Beets and carrots belong to that group of cool season crops that quickly reach edible maturity. That is to say the seed can be planted in the open ground just as soon as the ground can be worked. This would be about a week or ten days after seeding spinach or early wrinkled peas. Each locality will have certain soil and climatical conditions which will vary the date but it probably would be from March 20 to April 15th.

Start in Hotbeds or Greenhouses

Beets can be started in hotbeds or greenhouses and transplanted. They should be ready for bunching about one week earlier than those seeded in the open ground. Transplanted beets are usually not as smooth appearing as there is liable to be more of the fine hairy roots growing down the side of the main root. Carrots cannot be transplanted under field conditions.

These root crops, especially beets are well adapted to frame culture. The Norfolk, Virginia, trucking section has many small farms growing vegetables intensively, using frames during the early part of the season. Hotbeds for the production of early bunch beets and carrots can be started the middle of February and should be ready for seeding March 1st. Seed is sown thinly in rows six inches apart. These crops in hotbeds should be all cleaned out by June 10, allowing the frames to be used for cucumbers or eggplant.

Chantenay Carrot Good for Bunching

A good strain of Chantenay carrot cannot be beaten for bunching. This is of the stump rooted type from five to six inches long and two to four inches thick at shoulder. Chantenay has a brilliant orange color, flesh fine texture, rather small core and will produce roots with good smooth exterior. For both yield and quality use Chantenay.

Other varieties are Coreless, a very high quality root, perhaps one week earlier than Chantenay, four to six inches long, one and one-half to two inches thick, very little taper thruout its length and one of the Short Hornstrains. Scarlet Horn and French Forcing are the two varieties of these early small sized carrots. They are especially popular for very early bunching but the roots are so small that they will not compete with either Chantenay or Coreless in yield.

Crosby's Egyptian is an extra early deep red beet. The root has a medium sized top and is, therefore, well adapted for bunching. It requires about forty-seven days to maturity. Purchase a good strain of this variety and you will be satisfied to use it thruout the season for your bunched beets. Other varieties for later planting are Early Wonder and Detroit Dark Red.

Bunching Vegetables

The use of bunch carrots and bunch beets is increasing. It seems to be a convenient method of marketing. The consumer likes to see the fresh green tops. Bunches should contain well shaped uniform roots tied firmly and washed clean. Do not bunch ill-shaped and off-color roots; cut the tops of these and sell in baskets. The demand for bunched goods will grow. Keep up the quality and appearance of the bunch.

Chantenay carrot and Crosby's Egyptian beet can be used for early bunching and also used to make succession plantings in order to have a continuous supply. Six pounds of beet seed or three pounds of carrot seed will usually plant an acre.—W. T. Tapley.

Marketing Cabbage

I read a very interesting article by W. T. Tapley on early cabbage varieties. What I would like to know more about is marketing, what size head, how to pack, when to cut, where to sell, how to sell? I have grown cabbage for five years in a small way. Several times I had a surplus but did not know how to place it on the market.—S. H., Adams County, Pa.

In order to market cabbage or any farm crop we must be sure that a market is available. Vegetables are marketed in several ways: (1) the grower making up a load and going around from house to house selling at retail in small quantities; (2) attending the local curb market; (3) selling to stores in town; (4) shipping to a commission house in the city. If cabbage is the only vegetable crop you have to sell and you have small quantities only, your only market would be to go to some town with a curb market or sell to various grocery stores.

Shipping to Commission Merchants

Shipping to a commission merchant will usually not pay unless you grow at least two acres. There are commission men who buy cabbage in all the large cities and one or two in all of the small towns. You will generally find some of them advertising for produce in Pennsylvania Farmer or produce papers. A visit to various markets during the summer will enable you to line up a company to ship to. In choosing a town to ship to consider your railroad facilities. How far is it and what service can the railroad give?

Early cabbage is generally marketed, especially if shipped, in containers. Early cabbage in New York usually arrives in half-barrel hampers or barrel crates. Florida ships in a one and one-half bushel hamper, South Carolina barrel crates and Mississippi 100-pound crates. The one and one-half bushel hamper is shaped like a cone with the point cut off. The pointed head type pack well in these containers running about forty-five to fifty pounds to the hamper. These hampers are not very strong and are easily broken in shipment. Flat or round cabbage pack better in crates. A carload contains from ten to fourteen tons of loose cabbage.

Getting the Heads Ready for Market

Heads should be firm, the pointed type head weighing from two to four pounds. This is also good weight for early round head kinds such as Golden Acre or Copenhagen Market, but the late varieties should produce heads weighing from three to six pounds. Cut when head is hard and just previous to the time it will "burst." When you see one or two heads split you may be sure there are other heads ready for market. Yield per acre should be from six to twenty tons.

I suggest you write to the United States Department of Agriculture, Superintendent of Documents, Government Printing Office, Washington, D. C., and ask for copy of Department Bulletin No. 1242 on Marketing Cabbage.—W. T. Tapley.

Use Enough Seed

SEED, considering the returns, is the cheapest thing that can be bought. It is so cheap that it is false economy to skimp in seeding, cutting down the acreage and reducing the crops. There is a wide variation in the advice as to the quantity of seed per acre in addition to the natural variations caused by soil and climate.

The big seed houses have erred on the side of conservatism, according to the Department of Agriculture, and they have been notified that they are not recommending sufficient seed per acre. The seed houses were influenced by a desire to make the procuring of good seed as economical as possible for the farmer, but under federal advice they have been requested to revise some of their estimates upward.

Out of the Ordinary

It isn't often that any business is detected in the act of cheating itself, but the seedsmen seem to have done so in their acreage estimates as the government figures would increase their sales. The subject is under investigation, and figures will soon be available from government sources as to the proper amount of the field seeds per acre to plant. There is a tendency in periods of high prices to make the seed supply go farther than when it is on a cheaper plane, but the economy of this is very doubtful.

The farmer is disappointed in his thinly seeded crop and is inclined to blame the seed for poor germination and the seedsman for selling him poor quality seed, when in reality the fault was his own, too thin seeding.

Wide Variation in Seeding

Government figures show that clover seeding varies from an average of 8.5 pounds per acre in Tennessee to 14.3 pounds per acre in South Dakota. The usual textbook advice is from 8 to 16 pounds, dependent upon the fertility of the soil.

It is likely that the government and state scientists will shortly have a standardized basis of seeding per acre by which the farmer may be guided in his seed supply with better promise of a successful crop.

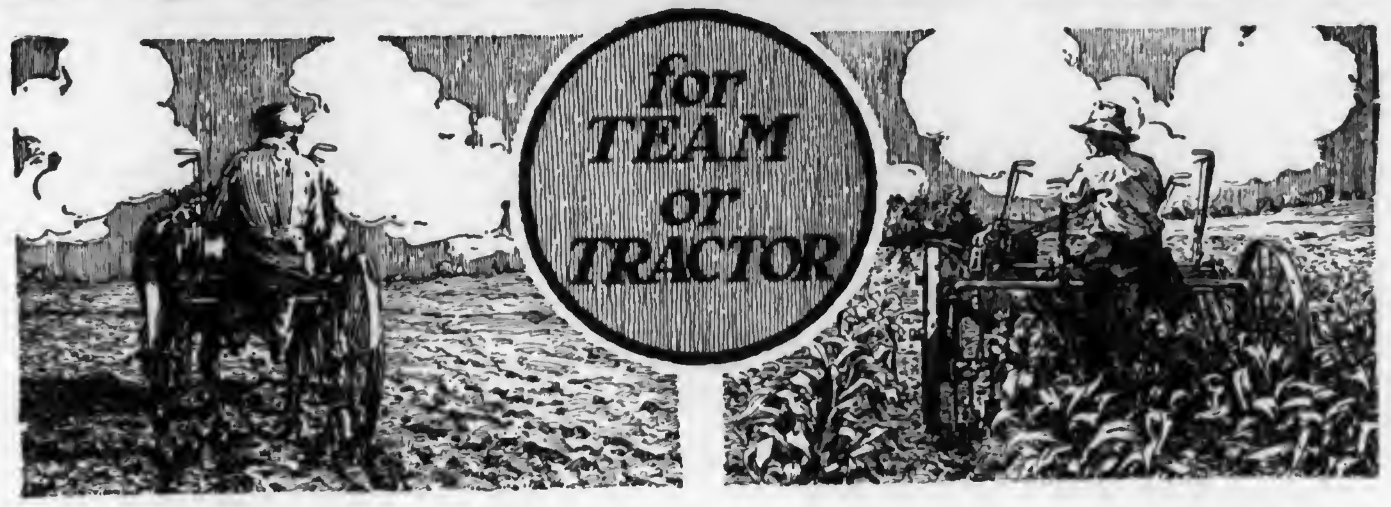
Cabbage Black-Leg

CABBAGE black-leg, a disease which caused unusual concern among Pennsylvania growers in 1922, is thoroly discussed in the latest bulletin of the Pennsylvania State College experiment station. The new bulletin is entitled "Experiments on the Control of Black-Leg Disease of Cabbage." It was written by Edgar G. Rex while a graduate assistant in botany and plant pathology at Penn State. He is now pathologist in charge of seed certification, New Jersey State Department of Agriculture. Copies of the bulletin may be obtained by writing to the Agricultural Experiment Station, State College, Pa.

Books on Vegetables

A NEW book, "Tomato Production," written by Paul Work, a 1910 Penn State graduate, is the first of a proposed series called, "The Vegetable Garden Series," edited by R. L. Watts, dean of the school of Agriculture of the Pennsylvania State College. It is the aim of the author to include in these books complete information on vegetable crops. At the present time, the second book of the series, "Potato Production" is being prepared by E. L. Nixon, extension specialist in plant pathology at State College.—A. L. B.

BUCKEYE CULTIVATORS



PLANT with Superior—and cultivate with Buckeye. That is the plan followed by thousands of farmers in every corn growing section of the country. Buckeye cultivation means far easier work and best possible results—always. Buckeye Cultivators are positively without an equal for simplicity of operation, lightness of draft, balance and flexibility. Like all the products of the Superior plant they are sturdily built of finest materials to give long years of dependable service.

The wheels of Buckeye Cultivators are pivoted to the frame. As a result they shift in unison with the beams by means of easily operated foot levers. This makes it an easy matter for the operator to hold the beams right up to their work—or to dodge hills in the most crooked rows of corn or other row crops. Buckeye Cultivators can be adjusted to cultivate rows from 36 inches to 48 inches apart. They are very strongly built, exceptionally easy to operate, have every possible convenient feature—and they do a perfect job of cultivating. The Buckeye line includes 1-row riding cultivators, 2-row riding cultivators for team or tractor and 1-row walking cultivators which are especially suitable for the cultivation of potatoes, beans, etc.

SUPERIOR Corn Planters

The Superior Corn Planter is built to do a hard job supremely well. It is simple, strong, easily operated—and like all Superior implements can be depended upon for utmost accuracy and precision in planting. The use of this highest-quality implement not only means a bigger, better crop, but far greater ease in cultivating. Straight, even rows of uniform height are a certainty—and there are no skips or misses.

Spraying and Dusting for ORCHARD and FARM with Bell Mine LIME

Send today for this
Free Booklet
on SPRAYING

BASED on authoritative data from State and Federal Agricultural Experiment Stations, this booklet gives proper formulas for spraying and tells when to do it.

Proper spraying is necessary to protect fruit trees and vegetables from the ravages of insect pests and diseases—But the success of your spraying depends upon the materials used.

Lime is a principal ingredient of the most effective sprays, and only a high calcium product, especially adapted for spraying, should be used for good results.

Bell Mine Chemical Lime has all of the properties essential for spraying and has the endorsement of leading agricultural authorities. Bell Mine Chemical Lime, both in its pebble and hydrated form, is produced from uncontaminated Limestone obtained by actual mining operations—it is pure, clean and under rigid chemical control during manufacture.

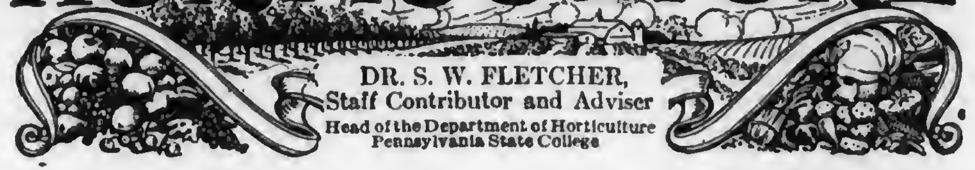
HORTICULTURE



DR. S. W. FLETCHER,
Staff Contributor and Adviser
Head of the Department of Horticulture
Pennsylvania State College

Not a Good Plan

In the December 12 issue of Pennsylvania Farmer under "Horticultural Week at Penn State," in talking of girdling of young apple trees, you say "If the girdled area is touched with hand when the bark is removed it will not heal at that point." Last August I did some budding. The success was not what I had expected it to be. After I had read your article referred to above I thought maybe the cause of my trouble was due to this, after removing the bud to be inserted I would hold it between my lips until I had made the opening and sometimes wet it with saliva for then it would slip very easily into the opening made. In your opinion was the failure to grow due to what I have stated? The horticultural department of Pennsylvania Farmer is the most interesting to me.—C. N. S., Lehigh County, Pa.

I am inclined to believe that it is not a good plan to hold the buds in your mouth when budding, and that this accounts in some measure for the poor success which you have had.—S. W. Fletcher.

Old Apple Orchard

I have an old apple orchard that was in buckwheat last year and was not seeded last fall. This orchard needs trimming and spraying. What is the best way to treat this orchard? I want a good spray solution. Would like to know how to treat the ground to raise crop of apples.—W. H. B., Columbia County, Pa.

In the first place, stop raising any crop in the orchard, and above all, a grain crop which is to be harvested; grow only crops that are to be turned under to improve the soil, as red clover.

It may be best to lay down this orchard in a temporary leguminous sod, composed of a mixture of alfalfa, red clover, alsike clover and sweet clover. Work it up well this spring, and seed in May or June, preferably without a nurse crop of oats, after having limed the soil if necessary to get a stand of the clovers. Let this sod stand two years, cutting the grass twice a year, before it seeds, and allowing it to fall down where it grew. If the orchard were young, it would be raked up beneath the outer limbs of the trees.

After two seasons, plow the sod and either keep the orchard cultivated for one season and then re-seed to mixed clovers, or re-seed immediately.

Ask Your County Agent

Consult your county agent about spraying and get a spray calendar from him. You will need to apply (1) a delayed dormant spray, when the buds are just beginning to open, using an oil emulsion or lime-sulphur solution diluted to 1.03 on the hydrometer which you should have. This is approximately the commercial solution diluted 1 gallon to 8 of water. The next spray (2) will be when the blossom buds barely show pink, using lime-sulphur diluted to 1.008, which is approximately one gallon to 36 of water. Add 3 pounds of arsenate of lead powder to each 100 gallons of this spray.

The most important spray (3) is that applied within three days after three-fourths of the petals have fallen, using the same materials as in (2). A fourth spray about ten days later, and a fifth about the first of July, using the same materials will be helpful. If aphis or red bug is serious you will need to add nicotine to the first and third sprays, at the rate of one pint of nicotine sulphate to 100 gallons of the spray.

If the orchard has been neglected, prune out all dead or diseased wood and thin the top of each tree heavily so that the sun can strike thru it and thus give size and color to the fruit. Be especially careful to cut out some of the numerous smaller branches, on the outside of the tree, as well as the large branches from the inside of the tree. Pruning may be done anytime from now until the leaves appear.—S. W. Fletcher.

Motor Truck in Michigan

MENTION was made in a recent issue of Pennsylvania Farmer of the growing importance of the motor truck in moving Pennsylvania fruit and other produce to market. The following, clipped from a recent issue of the Packer, indicates that the fifty-mile limit set by Porter R. Taylor, of the State Bureau of Markets, as the probable limit beyond which it may not pay to use the truck except for produce of high value, is being exceeded in Michigan.

"Motor trucks again played an important part in the marketing of Michigan's fruit crop in 1925, hauling practically all of the peaches and most of the grapes and small fruits.

"Trucks hauled peaches 200 miles from the Benton Harbor market last season, according to George Friday, of Coloma, president of the Michigan State Horticultural Society. Some of the trucks took almost a whole carload on each trip.

From Producer to Buyer

"The trucks left southwestern Michigan each afternoon and usually delivered their cargoes the next morning or the next day at the back door of the buyers in distant markets. The trucks are revolutionizing the marketing of fruit, according to Mr. Friday, and more fruit probably will be hauled overland in 1926 than in 1925.

"Herbert S. Newton, of Hart, vice president of the Horticultural Society, doubted whether a single car of peaches was shipped out of Oceana County by railroads this year. The trucks came right to the farms and bought the fruit as rapidly as it was picked from the trees, hauling direct from the orchards to consuming markets in this and other states.

"Markets formerly supplied from Hart and Shelby by rail now are getting their peaches by motor truck. The truckers hauled some apples but the bulk of this fruit went to market by rail from Oceana and other counties in the fruit belt."—S. W. Fletcher.

In Winter and Summer

LITTLE difference has been noted between winter-pruned and summer-pruned apple trees on the grounds of the New York State Agricultural Experiment Station at Geneva where a comparison of winter and summer pruning has been in progress for several years. The station horticulturists advocate pruning apple trees in winter, however, when the operation can be more carefully and easily performed. Either practice of pruning will prove satisfactory while the trees are young, but for sake of convenience fruit growers may well adhere to the usual plan of winter-pruning when the framework of the tree is entirely visible and when other farm operations are less pressing.

Stayman More Popular

IN A local market state like Pennsylvania it is natural that high quality varieties of apples should gradually gain in popularity, and ultimately dominate the trade. Hence the sharp decline in the planting of Ben Davis and York outside the wholesale district of Adams and Franklin Counties, and the sharp advance of Stayman, Grimes and Delicious.

Following is the result of a survey conducted by the Lancaster County Farm Bureau in that county:

	Present stand %	Future planting %
Stayman	32.4	33.0
Delicious	8.1	3.9
Smokehouse	7.4	7.0
Grimes Golden	6.1	11.1
Summer Rambo ...	2.1	3.9

The percentage of standing trees of other varieties, according to the survey, is as follows: Wealthy, 4.4; Yellow Transparent, 4.2; Jonathan, 4.1; Rome Beauty, 3.5; MacIntosh, 2.8; Fallowater, 2.8; Baldwin, 1.6; Paragon, 1.5; Winter Banana, 1.4.—S. W. Fletcher.

Bethlehem Receipts

BETHLEHEM was one of the few Pennsylvania cities showing an increase in the total quantity of fruits and vegetables unloaded by the railroads, according to figures prepared by the Bureau of Markets of the Pennsylvania Department of Agriculture. During the year 706 cars were unloaded, as compared with 663 the previous year, or an increase of 6 per cent.

Exactly half of the total receipts consisted of mixed cars of fruits and vegetables re-shipped from the Philadelphia market. To a large extent such cars are loaded with products which are not required in carlot quantities.

Apple receipts increased from 50 cars in 1924 to 86 cars in 1925. This was largely the result of the arrival of 60 cars of New York apples, mostly during the fall of 1925, as compared with only 8 cars from that state during the entire year previous. Receipts from both Pennsylvania and Virginia decreased somewhat, but the 7 cars of Washington apples reported in 1924 were not duplicated in the records for this year.

Potatoes Decrease

Potatoes practically disappeared from the records during the months when local stock was available, only 15 cars were found for the entire year, and 9 of these arrived during the months of June, July and August. There was a noticeable decrease in the quantity of early potatoes received from both Virginia and New Jersey, a total of five cars arriving as compared with 28 cars last year from these two states.

Next to mixed produce, grapes were the largest single commodity reported, 119 cars being unloaded as compared with 136 the previous season. Two-thirds of these came from New York State, 66 of them during the months of October.

Receipts of bananas in direct shipments from seaports, mostly Philadelphia, became a factor of some size during the year. While only one car was reported during 1924, 33 arrived during last year.

Two small boys, staring in a barbershop window of London, earnestly looked on as the barber went over his customer's hair with a singeing torch. "Blimey, Bill!" one of them ejaculated, "he's lookin' for 'em wiv o light!"—Pract. Druggist.

Schoolgirl (at the telephone)—Oh, father, do come home. I've mixed the plugs in some way. The radio is all covered with frost and the ice-box is singing, "Way Out West in Kansas."—Success Magazine.

MORE POWERFUL TRACTORS
Save Time and Money

Plowing Cost Reduced!

Theories don't count in operating a farm. Results are what you must have. You can't dodge the fact that more than 60 per cent of your operating cost is for POWER and LABOR. You can't dodge the fact that every year you must fight TIME and bad weather.

These are the elements that determine your profit and your loss. And the way to make more money is to reduce the cost of these factors by having a tractor that is big enough for your needs—an OILPULL of the right size.

Take your spring plowing, for example. An OilPull of the right size will cut the cost of your plowing to the lowest point in history. Never in agricultural history has man power, animal power or mechanical power been able to turn over an acre of ground at such a low cost for time, labor and power. And here are the reasons for this amazing economy.

LOWEST FUEL COST. Fuel cost is the biggest CASH ITEM in tractor operation. The OilPull has held all Fuel Economy Records for the past 14 years. Triple Heat Control, Oil Cooling, Hairline Governing, Perfect Carburetion, Ball Bearing Transmission, Complete Enclosure and other features make this possible.

PLOWING TIME REDUCED 50%. One man handles a 3-plow OilPull as easily as any 2-plow outfit. But instead of plowing half again as much, owners report that he actually does double the work and *saves half his time.*

LABOR COST REDUCED 50%. Doing double the work, this man cuts 50 per cent from his cost per acre—reduces labor cost by one-half. With larger OilPulls, labor cost is reduced still more.

LOWEST UPKEEP EXPENSE. An OilPull seldom needs attention. Average upkeep cost among hundreds of OilPulls is *less than $20 per year.*

SLOWEST DEPRECIATION. The *proved* average working life of an OilPull is 10 years and more. The new *Light-Weight* OilPull will last even longer. This means a remarkably low depreciation loss per year.

It is unusual economies such as these that reduce the cost of both drawbar and belt work to such a phenomenally low point for OilPull owners. Be sure you get a tractor that is *big enough* for your work.

Light-Weight
OILPULL
A 10-Year Tractor

The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, husker-shredders, alfalfa and clover hullers, bean hullers, silo fillers, corn shellers, motor trucks and tractor winches

PAN-A-CE-A
prevents and relieves little-chick ailments

Indigestion, bowel troubles, leg weakness and gapes.

Pan-a-ce-a contains Nux Vomica; that promotes digestion; calls into healthy action every little-chick organ.

Pan-a-ce-a contains Quassia, which creates a healthy appetite.

Pan-a-ce-a contains laxative salts, which help the bowels carry off the trouble-making poisons.

Pan-a-ce-a contains iron to enrich the blood, so essential to chick growth.

Pan-a-ce-a supplies the minerals so necessary to chicks during that period of rapid growth, bone and feather development.

Add Pan-a-ce-a to the ration, then you'll forget all about the ailments.

Costs little to use Pan-a-ce-a

You just add 5 tablespoonfuls to each 10 pounds of mash—only 1 pound to every 50 pounds of mash.

REMEMBER—*When you buy any Dr. Hess product, our responsibility does not end until you are satisfied that your investment is a profitable one. Otherwise, return the empty container to your dealer and get your money back.*

Wants Broody Hens

I saw in Pennsylvania Farmer some time ago something about broody hens, how to cure them. Now, please tell me how to get broody hens for I would like to have clucks as soon as possible.—Mrs. C. E. W., Dauphin Co., Pa.

I know of only one way to have broody hens in late winter and that is uncertain—cull the flock and keep only winter layers. Even then the best layers often do not become broody and will lay all winter, not showing signs of broodiness until late spring or maybe not at all.

Naturally hens that do not lay until spring will not become broody in the late winter before production has started. A mixture of Leghorn blood in the flock will cut down the broody tendency among the hens. The only practical way to obtain many early hatched chicks is to buy day-old chicks or hatch them with your own incubator.—R. G. Kirby.

Will Hen Accept Chicks?

I would like to know, when a hen wants to hatch and you place artificial eggs under her for three or four days, after removing these eggs would she accept baby chicks and take care of same?—G. W., Bergen County, N. J.

Many hens will accept chicks after three or four days of broodiness. When I first started in the poultry business and lacked sufficient coal brooders I often used hens in that manner. The chicks were placed under the hens at night and the nest boxes covered to keep in the chicks and keep the hens from leaving. I always visited these nests at sunrise.

If the hens were talking to the chicks and the chicks were peeping back, there were good chances that the adoption was successful. I then uncovered the boxes and let the hens see the chicks. The chicks would pop out from the feathers. If the mother hen stabbed viciously at them, they were removed and given to another hen.

An ugly hen will soon kill every chick that is given her. It pays to have a few setting hens in reserve if there are many chicks for them to hover. The good mother hen will show a friendly interest in the chicks but will not strike at them. Such hens seem to do as well in brooding a flock as hens which have been setting three weeks. About four out of five of my Barred Rock hens seemed to be glad to find chicks placed under them at night even tho they had been setting only three to five days.—R. G. Kirby.

Preserving Eggs

Will you please publish in your farm paper some good way to preserve eggs to keep from March to December?—A. L. H., Mercer County, Pa.

The water glass method of preserving eggs for home use is very satisfactory. Boil ten quarts of water and allow it to cool. Then mix one quart of water-glass with the cool boiled water. This amount of solution is good for about fifteen dozen eggs.

Place fresh, clean, firm-shelled eggs in a large stone crock and pour in the solution. An inch of the mixture should be over the top of the eggs. Cover the jar to prevent evaporation. Fresh water-glass should be mixed each year and no attempt made to use the solution the second time. Some failures with water glass preserving may be due to the quality of the eggs when first placed in the mixture.

It pays to use eggs produced at home or know the source of the supply. Fertile eggs will keep very well in water-glass in a cool celler but it is undoubtedly safer to use infertile eggs and avoid storing any eggs in which the germ has made even the slightest growth. A dry, dark cellar in which the temperature will never go above fifty or sixty degrees makes a good storage place for the eggs.—R. G. Kirby.

To Build the Bones

THE main things necessary for proper development of the bones in baby chicks are lime, ground bone, and direct sunlight.

Direct sunlight permits phosphorus, which is carried in the bone, and lime to be laid down in the body of the bird. If direct sunlight cannot be had—and this does not mean light taken thru glass—it is necessary to supply cod liver oil or egg yolks in the ration. The cod liver oil can be poured on chick-sized charcoal and easily mixed in the mash mixture.

Because the oils vary so in potency and because the conditions under which the chicks are raised differ so radically, it is impossible to say just how much oil should be used. Two per cent of the mash mixture is the amount usually recommended. Expressing it more concretely, two pounds of oil should be put in every hundred pounds of mash when the chicks do not get much sunlight.

When the chicks are few in number and it is easier to feed the oil in a daily wet mash; the following formula may be followed safely; for the first and second week, two teaspoonsful per hundred chicks, and for the third and fourth week, three teaspoonsful to the same number.

After the fourth week, four teaspoonsful should be fed daily. If the egg yolks are used to supply this stored up sunlight, feed one egg to thirty chicks. The eggs may be whipped up in milk, or mixed in a wet mash. One and one-half pounds of mash will absorb twelve raw egg yolks or enough for 350 chicks.—D. McK. Gray.

Mr. William Lehr, of Northampton County, uses concrete wherever possible in making repairs about his home.

The Best Pullet Flock

TWO hundred White Leghorns owned and managed by C. C. Luehm, McKeesport, led the Pennsylvania poultry farm demonstration flock of 100 or more pullets in January. They averaged twenty eggs each. The pullet standard for the month was 11.2 eggs per bird.

The next best pullet flocks were those of McCoy Brothers and Company, Emlenton, 1221 birds, 19 eggs each; J. C. McCoy, Jr., Emlenton, 880 birds, 17.8 eggs; John Toivonen, Girard, 253 birds, 17.6 eggs; W. L. Pellam, Emporium, 165 birds, 17.5 eggs, and N. C. Fetterman, Catawissa, 984 birds, 17.5 eggs. All of these flocks were composed of White Leghorns.

Flocks of fifty or more were led by H. C. McCullough, Salina, 480 hens, 10.9 eggs each; Welsbret Farm, Newtown, 865 hens, 9.2 eggs; Fred Haller, Hollidaysburg, 95 hens, 9 eggs; William Heimberger, Saltsburg, 436 hens, 8.5 eggs; John E. Donaghy, Atlantic, 340 hens, 8.3 eggs. The Haller flock was White Wyandotte, all the rest were White Leghorn.

In the 100 hens and pullets division the leading flock was one of 771 White Leghorns owned by W. W. Hatfield, Mansfield. It averaged 16.3 eggs per hen. The other leaders in the division were Orwell Ridge Farm, Rome, 1013 mixed birds, 12.7 eggs each; E. E. Case, Oakville, 1360 White Leghorns, 10.9 eggs; Clyde Houck, Clymer, 180 White Wyandottes, 10.7 eggs; Harry A. Bair, Ruffsdale, 384 White Leghorns, 10.6 eggs.

Uses Stale Bread

THERE'S nothing I like better for my little chicks and turkeys than stale bread crumbs mixed with hard-boiled egg and pinhead oats or the prepared chick grain. If inquiry is made it's often possible to get old bread at stores for much less than half price and it crumbs much nicer than home-baked. Never accept moldy bread.

As soon as you buy the bread tear the papers from it, crumble it up, grind the crusts and put in a dry place to dry thoroly. If you can a quantity, and have only a few hens, stale bread soaked in sour milk makes a fine feed for once a day.—Mrs. C. B. L., Crawford County, Pa.

A Capon Association

A YEAR ago last spring fifteen Schuylkill County boys and girls organized a capon club, with the aid of County Agent Bollinger, and grew 180 capons, which they sold at fifty cents per pound. Last year the old folks of that community followed their children's good example and raised nearly a thousand capons, formed a Capon Producers' Association, and marketed their birds at forty-five cents a pound, a very good price when it is considered that money was scarce in that region on account of the coal strike.

Riverside Tires & TUBES
OVERSIZE CORDS
BALLOONS

RIVERSIDE OVERSIZE CORD

$11.25
30 x 3½ OVERSIZE CORDS FOR FORDS
All sizes at equally low prices

Your Saving is One-third

12,000 Miles Guaranteed on Oversize Cords

If more money would buy *more quality*—more miles of satisfactory service—you might consider paying a higher price. But—when a "Riverside" gives you the utmost service—the last yard of mileage—why pay more money for a tire?

The Greatest Tire Value in the Whole World

Ward's is the largest retailers of tires in the world.

We buy our own new live rubber in the Orient—millions of dollars' worth at a time.

Riverside Tires are made in our own molds, under our own personal inspection. They are bigger, heavier, and stronger because we put into them more strength—more new live rubber, the finest materials.

A Fully Guaranteed Quality Tire

"Riverside" is a Quality tire. The low price is made by the lower cost of selling and not by saving on materials or labor. We use the finest quality materials—and guarantee Riversides equal to tires selling for $5 to $15 more.

A 54 Year Old Guarantee

Since 1872 Montgomery Ward & Co. has been dealing with the American public under an iron clad guarantee. We could not put our guarantee back of this tire unless exceptional quality was put into the tire.

You cannot buy a tire with a better, older, more responsible name and guarantee. So why pay more money? Why not save one-third on your tires, too?

The Wolves of Disease Lurk Near!

THE first 6 weeks after the eggs hatch is the Dangerous Time for Chicks. Always the "Wolves of Disease" lurk near—fangs bared, ready to cripple, runt, kill.

Cold, damp or dark housing, poor ventilation, and particularly improper feeding, are the wolves' allies because they lower vitality and resistance.

Well fed chicks thrive without the ideal care which is so difficult to maintain. But even the slightest error in feeding during the Dangerous Time—3 days to 6 weeks—does serious injury. Dead chicks, stunted, light cockerels, poor irregular layers, and every day longer that it takes to mature the flock means a loss of feed.

But these losses which eat up your profits are unnecessary. Carry your chicks over the dangerous time—assure swift growth, freedom from disease, big profits with:

DOMINO CHICK FEED and DOMINO CHICK STARTER WITH BUTTERMILK

The First Big Point:
All ingredients are low in fiber, finely ground, and specially processed to make them easily digestable. The chick gets all the good out of all it eats.

The Second Big Point:
Wide variety of ingredients—vegetable and animal protein, buttermilk, minerals and every necessary food for building strong, hardy bodies resistant to cold, wet, imperfect ventilation, disease.

The Third Big Point:
Every ingredient is present in proper proportion for building rich blood, strong muscle, heavy frame—insuring, as thousands have found, the rapid growth of practically every chick in the flock. You can put the "Wolves of Disease" farther and farther into the background, make them slink snarling into the distance by feeding DOMINO CHICK STARTER and DOMINO CHICK FEED. Insure your profits now, see our local Dealer.

Coupon Brings Valuable Directions Free

It would be nice to raise chicks without losing many by disease, wouldn't it? Will These Be Yours?

Next December the first prize dairy herd in our great Feeders' Contest will be pictured something like this and sent to five million farm families. How would you like to win this honor and the $1,000.00 prize?

Some dairy cow owner is going to win first place on his good feeding record. Will it be you or some one else? Enter now and feed right for some of this prize money.

122 Cash Prizes—$15,000.00

14 Prizes for Cow Testing Associations	$ 3,000.00
14 Prizes for Individual Dairy Herds	2,100.00
7 Prizes for Championship Cows	1,000.00
14 Prizes for Beef Cattle Feeders	2,500.00
12 Prizes for supervisors or verifiers	2,650.00
24 Prizes for herd managers	1,250.00
37 Prizes for co-operating feed dealers	2,500.00
122 Prizes, totaling	$15,000.00

These prizes are for feeders who make the best production records. If you are feeding six or more dairy cows, or forty or more beef cattle you can enter this contest—just as you enter your state fair.

No Entry Fee—No Stall Rent

Feed any ration you like just so it contains Corn Gluten Feed. You will make money by entering this contest because Corn Gluten Feed makes more meat or milk per dollar of cost than any other high protein feed you can buy.

Corn Gluten Feed is made wholly of sound corn. It is the gluten and bran of corn. There is less than 8 pounds of bran in 100 pounds. One ton of Corn Gluten Feed gives you the best feeding part of three tons of whole corn.

Don't Put It Off—Write Now

This contest starts April 1 and ends September 30, 1926. The prizes will be awarded and paid December 1. Don't wait until the last minute but write today for application blanks and Bulletin No. 4.

Pennsylvania State College

Points to Consider When Selecting a Dairy Cow

THE most important characteristic that the farmer wants in his cow is production, which is dependent upon the eating of feeds. The ability she has to convert feeds into dairy products will depend very much upon her general conformation and type which is determined largely by those characteristics that indicate constitution, those that indicate capacity, those that indicate blood circulation and those that indicate the proper nervous temperament. All of these are more or less constant and the regularity with which these characteristics are transmitted to her offspring is the second consideration of the farmer when he selects a cow. This is known as reproduction.

All of these can be readily recognized by the experienced cattle man. They are more or less constant and occur in a greater or less degree in each and every dairy animal. None of them can be safely overlooked, if one is to expect good production.

Make Careful Inspection

In selecting an animal, a careful inspection should always be made, in an orderly fashion, so that none of these points are overlooked. If a definite system is always followed in making this examination fewer errors will be made. The animal should be viewed from both sides and from the front and rear; the animal can very well be observed while it is walking toward the one who is inspecting it. The udder should be handled and if the cow is in milk she should be milked to determine that the udder is not diseased or damaged. A study from a little distance is usually a very good way to start the examination.

The cow of all the farm animals is without doubt the hardest worker of all; she must consume large quantities of feed which must be converted into milk, and in addition to this she must carry a calf for several months and produce the nourishment for it until it is born and all thru the period of development. In addition to all these the cow must take care of her own body. The food value of the product of a good cow amounts to several times as much as any other animal of like size. Many cows continue to produce under this strain for many years, often as many as ten to fifteen. This means that the cow must have a very hardy constitution and plenty of vitality.

General Characteristics

Some characteristics that indicate constitution are large open nostrils, not too stiff, and a large windpipe as indicated by the under side of the neck; a deep chest cavity, as well as thickness thru the chest, and a large middle. The strength of the jaws will also indicate somewhat the constitution of the cow. She must have plenty of room for the heart and lungs. The chest of the cow need not be as wide in proportion as that of other animals for the extreme depth allows for the heart and lungs.

The appearance of the eyes and horns is also indicative of constitution, but not to the same extent as the characteristics already named; however, an animal that has a bright clear eye, one that is large and full, is very likely to be a strong healthy animal, while one that has a sleepy appearance with eyes that are dull, small in size and poorly placed is often very weak in constitution. Animals with horns that are large and strong at the base and taper to the points are usually stronger than the animal whose horns are about the same size thruout and which are small at the base.

By capacity we mean the ability to consume large quantities of feed and the ability to digest it and convert it into material that will nourish the body and produce milk. It is plain that even tho an animal might have the other characteristics that would make her a good cow, she would be of very little value without the ability to consume sufficient feed to supply the material for a large flow. This is determined largely by the shape and size of the jaw, which should be strong and muscular with flexible, well defined lips. The ribs should be well arched so that the abdomen will furnish plenty of room for the abdominal organs. The abdomen should be large and roomy, deep and wide. The skin will usually indicate the digestive power the cow has. Animals with a loose, pliable skin usually have good digestive organs and have very little trouble digesting large amounts of feed, while those who have a harsh, tight, coarse skin, are just the opposite. The cow that is a heavy producer has ribs which are usually spread considerably, so that it is possible to place the width of two or three fingers between the ribs. The cow that is a heavy producer will be found to have a body that is long from the shoulder to the hip bones and broad, well-sprung flat ribs and a deep body.

The Qualities of the Skin

The handling qualities of the skin are, no doubt, among the surest indications of ability to consume and digest large quantities of feed. The animal whose skin becomes tight to the body, whose hair will stand on end and whose eye appears sunken and sleepy in appearance is of low vitality. These are the first indications that an animal is going off feed, and the experienced feeder will notice it. This is much more important than the fact that the cow refuses some of her feed.

The ability to work is one of the very important characteristics of the dairy cow. It is one point that must not be overlooked. We do not mean, when we refer to it as nervous temperament, that the animal is nervous and fretty and excitable, but on the other hand we mean that she is always ready for her meals, and chewing her cud when she is not eating or grazing. It is this ability that enables her to continue producing large quantities of milk year after year, and reproduce her kind. Animals that have a good dairy temperament will produce creditably under most any condition, while animals that lack this temperament will vary in their milk flow with every small change that takes place. Such animals are hard to handle, as the presence of strangers and the like will influence milk production.

The cow that is producing and that is using large quantities of her feed to produce milk will not have any surplus fat between the ribs or along the backbone. The spaces between the backbone and the ribs are loose and the tips of the fingers can be inserted between them, while the cow that is a poor producer will be very tight and the spaces will be filled with fat.

The amount of blood that circulates thru the udder of the cow is usually an indication of the ability of the cow as a producer. This is shown by the size and length of the mammary veins, which are the large veins located on the underside of the abdomen, and enter the milk wells. This blood circulation must carry the nutrients that are taken into the body as food to every part of the body where the tissues are nourished. These veins are two in number, one on either side of the abdomen just a little out from the center line. They pass into the abdomen thru small holes in the wall of the abdomen, and the size of these holes indicates the size of the veins when they are filled to capacity. These wells will vary in number from one or two up to five or six wells. The more wells present, the higher producer the animal will be with the proper care and feed. These veins do not carry milk as many people have heretofore supposed, but they carry blood.

Contrast Between Cows and Beeves

There is a marked contrast between the cow and the beef animal, for in the beef animal the blood largely flows toward the top of the body where the greatest growth is wanted, while in cows that are intended primarily for milk, the flow of blood is thru the udder and toward the under line of the body. All heavy producers have the heavy system of veins.

The ability of the cow to produce milk is determined largely by the shape and texture of the udder as well as the shape and condition of the surrounding structures. Cows with thick heavy thighs are rarely good producers. The same may be said of the rump, which in heavy producers is long and sloping, while in the poor producer it is steep and short.

The udder placed well forward on the abdomen indicates large production. Considerable surface is attached to the abdomen and it should not be slender and pendant. The udder that is solid and firm is not a highly productive one. The udder that has a pliable and elastic skin and which is loose when milked out is usually a good producer. The quarters should be more or less uniform and the teats should be well placed.—G. H. C.

Gertrude Claire

GERTRUDE CLAIRE, a Guernsey cow owned by F. R. Hartzell, Butler County, Pennsylvania, has recently completed a record which places her fifth for butterfat production in the mature class and ranks her as second highest milk producer in the Guernsey breed. Her unofficial production figures, according to P. S. Williams, in charge of advanced registry work at the Pennsylvania State College, are 20,738 pounds of milk and 1018 pounds of butterfat.

Headed Cow Testing Association

Gertrude Claire first gave promise of being a good producer when in the Butler County Cow Testing Association she headed the list of cows tested, with a production of 9839 pounds of milk and 508 pounds of butterfat, as a junior two-year-old. As a result of her good showing, coupled with the records made by seven of her stable mates, Mr. Hartzell decided to enter advanced registry work. Under ordinary farm conditions Gertrude Claire made a world's record in milk production in class C and missed the butterfat record by less than eight pounds. Her record was 18,942.5 pounds of milk and 893.4 pounds of butterfat.

She is the ninth cow in the Guernsey breed to produce 1000 or more pounds of butterfat.—A. L. B.

Which Question Do You Ask?

What does it Cost ?
What will I Get ?

ARE you content with buying feed simply on the basis of "How much does it cost?" Or are you farsighted enough to look further into the feed question and ask "How much milk will I get in return for the cost of this feed?"

If all feeds produced the same amount of milk—or kept cows in the same condition—you'd be justified in buying on price alone. But they don't.

It costs more money to use only choice ingredients in Larro and to blend each one to a fixed standard, to insure unvarying perfection in the finished feed. It costs something to insure absolute cleanliness and freedom from tramp iron and steel. But those things make Larro produce more milk. And a feed that produces more is naturally worth more.

Next time you buy feed remember that you are buying *results*—not price, nor protein, nor individual feeding theories. Ask yourself, not—"What does it cost?," but, "What will I get?"—and you'll never feed anything else but Larro.

Where Everybody Loses

IN recent issues of this paper we made use of our advertising space to call attention of Dairymen to a policy of buying which we are convinced makes profit for some one but not the Dairyman.

Our object in that message was not to tell farmers how they should buy but to give them the benefit of our conclusions after very carefully studying the question from the standpoint of what is for their best interest.

In the same spirit we wish in this issue to call attention to what we consider another practice which has crept into the distribution of feed which results in direct loss to the feeder. That is the practice of manufacturers sending out field or specialty men to resell feed.

Have you ever stopped to think who has to pay the salary and expenses of the man who comes to your house to sell you feed?

As manufacturers we have tried that plan and found it cost several dollars per ton. The feeders were receiving no added benefit so we abandoned the practice for it is a rule of our business that what is best for the feeder in price and quality decides our policy.

Our suggestion in buying feed is to go to your local feed dealer and with him study the merit of the different manufactured feeds; how uniform they run and results they have given others. Don't look at the price of the feed but what the milk will cost that it produces and the condition in which it keeps the cows. In other words don't pay several dollars per ton to have some one come and sell you but you go and do the buying and see how much you can save.

We hope your decision will be for Tioga Dairy Feed which is made in three brands to be fed with different kinds of roughage and produce milk at lowest cost, but whether you decide on Tioga Dairy Feed or not, we know you will save money by doing the buying rather than being sold.

In another issue in the near future we will devote this space to consideration of the assistance we render through recognized authorities in Animal Nutrition, Dairying and the Poultry Industry, who give their entire time in the interest of feeders.

HINMAN Users Produce Clean Milk

Read the letter. There's one example from a mass of such letters from all over the country. They tell of results that other practical dairymen are getting. Many speak of producing Certified and Grade A milk. They quote actual low bacteria counts. They go back and show 5, 10, 15 years continuous success in producing clean milk with their Hinmans.

That's real proof for you!

Hinman Simplicity!

That's the secret! Easy to keep thoroughly clean! Nothing impossible to get at. No long pipe-line, or complicated mechanism. Teat cups and valve chamber easily cleaned as a tumbler!

That same simplicity also means dependable operation, at low cost.

These time-proved Hinmans are the Milkers you want to look into, to end that milking labor, save 1-2 to 2-3 milking time, and earn bigger profits. Write today for full information.

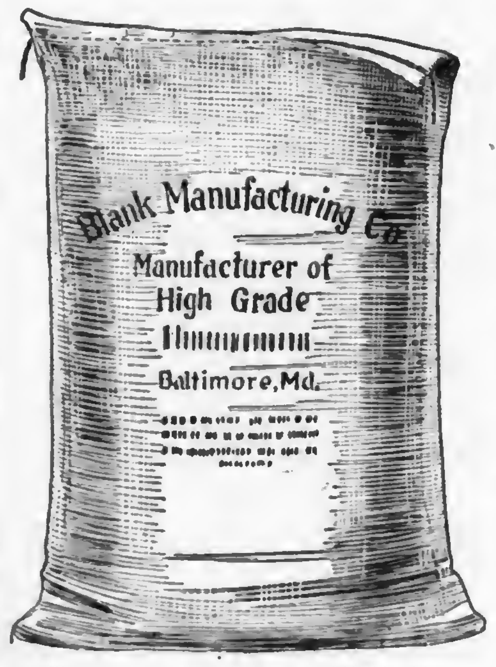
How to Open Filled Bags

Whether They're Hand-Sewed or Machine-Sewed

AS A rule bags are opened hurriedly, only to find in the end that they are damaged to such an extent as to put them beyond any hope of utilization again.

Whether the bag is hand sewed or machine sewed, there is a right and wrong way to open it. The use of a wrong way may be expensive in the time consumed or in damage done to the bag. In fact, many bags are ruined annually because of carelessness and the lack of knowledge of the correct method of opening. This applies alike to hand-sewed and machine-sewed bags, with the odds probably in favor of the latter, for the reason that persons opening machine-sewed bags soon arrive at the correct method. In opening hand-sewed bags, it is necessary to pass a knife between the twine and the fabric in several places, and unless care is used the bags are apt to be damaged.



Blank Manufacturing Co.
Manufacturer of
High Grade
Baltimore, Md.

Figure 1

Most Efficient Method

The most efficient method of opening hand-sewed bags is as follows:

1. Insert a knife between the twine wrapped about the ear of the bag and the ear itself, with the back of the knife to the bag, and push downward until the twine is severed.

2. Repeat on the opposite ear.

3. Cut the twine between the ears in one or more places, depending on the width of the bag.

4. Unfold and grasp edges of the bag and open. With care bags may be opened by this method with a reasonable degree of speed, and without cutting or tearing the fabric.

The usual stitch used in closing bags by machine sewing is the double-locked stitch. This stitch is formed of two threads, and is identical with the stitch used for the side and bottom seams of the bag.

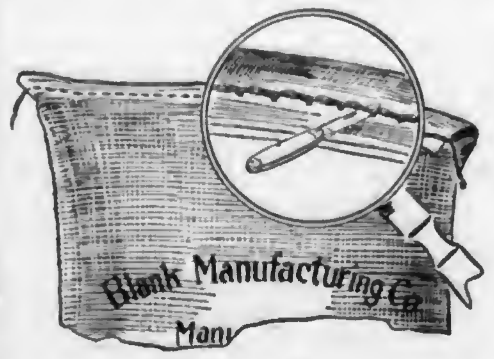


Figure 2

Bags closed with the double-locked stitch can be opened more easily and with less likelihood of damage than bags closed by hand. The stitch is unlocked at the finishing end of the seam and the threads readily pulled out, without leaving any loose ends of twine mixed in the contents. The method of opening bags closed with the double-locked stitch is as follows:

Stand the bag in a vertical position, with the plain side in the closing stitch toward you. Bend down the right-hand end, as shown in Fig. 1.

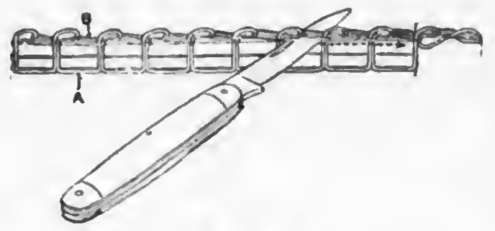

Figure 3

Insert the blade of a pocket knife between the double-locked side of the stitch and the bag two or three stitches from the right-hand end, as shown in Fig. 2.

Cut thread "A" as indicated in Fig. 3.

Take thread "B" in one hand and thread "A" in the other, as shown in Fig. 4, and pull the threads in opposite directions.

The stitch will open readily, as shown in Fig. 5.

Bags are occasionally closed with the chain stitch. This stitch is formed of a single thread looped continuously into itself, and the seam produced can be opened readily by:

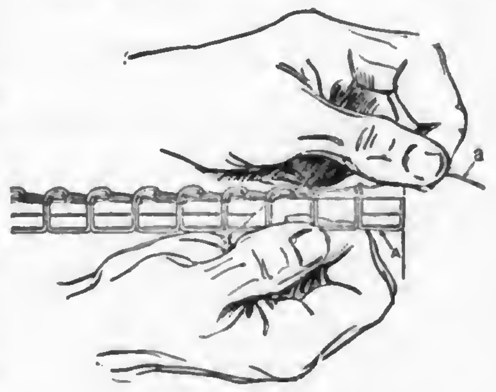

Figure 4

1. Cutting the thread close to the right-hand end of the seam with the bag standing as shown in Fig. 1.

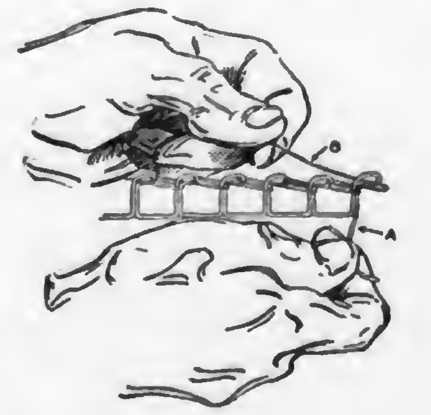

Figure 5

2. Pull the end of thread thru to the plain side of the stitch.

3. Continue pulling this thread and the bag is opened.—O. Austin Horsack.

Leads in Better Breeding

WITH thirty-eight bull associations, Pennsylvania takes the lead in this phase of the "Better Sires" movement in the United States, according to S. J. Brownell, dairy extension specialist of the Pennsylvania State College. Of the thirty-eight associations, twenty-three are Holsteins, eight are Jersey, four are Guernsey, and there is one each of Ayrshire, Brown Swiss and Milking Shorthorn. Butler County leads the state with seven associations.—A. L. B.

Increase in Tariff on Butter

THE butter market during the week ending March 10 developed no new items of outstanding interest. Following a week of sharply declining prices on all scores it has been mostly a period of marking time for the purpose of getting a more definite perspective on the conditions affecting the price movement.

From Thursday of last week to Wednesday of this, the market on 92 score butter at Philadelphia declined a cent and a half to 44c.

Trading has generally been fair but there has been little speculative inquiry and with continued liberal receipts, operators are not inclined to risk heavy holdings at any higher prices. Ninety score "whole milks" were in light supply, as were full 90 score centralized goods. Undergrade butter was not in heavy supply, but did not move readily except at price concessions.

President Signs the Proclamation

The outstanding news of the week, perhaps, was the announcement of an increase in the tariff on butter from eight to twelve cents a pound. The proclamation was signed by the President on Saturday March 5, and will become effective on April 5, thirty days grace being allowed. The new tariff will not be applicable to butter withdrawn from bond before that time. Any butter entering after that date whether new shipments, or drawn from bond will be subject to a twelve-cent duty.

This will have little immediate effect on butter prices as the season is now almost too far advanced to bring in foreign butter in any amount. No doubt a higher price level will be effective during the storage season than would have ruled otherwise, as operators will have less reason to fear the usual influx of foreign butter in the winter months.—W. R. W.

Inter-State Milk Prices

THE Philadelphia price of milk, in effect March 1, as quoted by the Inter-State Milk Producers' Association, is as follows: For 3 per cent milk, basic quantity, $2.94 per 100 pounds; 6.3 cents per quart. Class 1, surplus, $2.31 per 100 pounds; 5 cents per quart. Class 2, surplus, $1.95 per 100 pounds; 4.15 cents per quart. The differential is 4 cents for each tenth point and 2 cents for each half tenth point up or down in butterfat test.

Backs Potato Club

W. H. VAN SANT, county agent in Lycoming County, reports plans for a potato club which will be a little different from those conducted during the past three years. The Kiwanis Club of Williamsport has agreed to sponsor a potato club whose members will each grow one acre of potatoes from certified seed furnished by the club. It is hoped to make each boy's project a demonstration of the principles of economic potato production to the people in his community.—A. L. B.

Pennsylvania Agriculture before 1800

COLONIAL historians, in writing of the first farmers of Pennsylvania, have recorded the fact that no colony in the New World had such a variety of producers as Pennsylvania. They came from England, Scotland, Ireland, Germany, France, Sweden, Holland, Switzerland and Italy, and they attempted to apply the same kind of farming that they were accustomed to.

The immigrants from Germany who took to farming as an occupation upon settling in Pennsylvania appear to have outnumbered those of other countries. One historian states, "They were principally hardy, industrious tillers of the soil, whose entire stock usually consisted of a few pieces of metallic currency, a chest of clothing, some tools and farming implements, a Bible, a Psalter, a hymn book and the Catechism."

Few of the first farmers had horses or cows. The first few crops of Indian corn were tilled with hoes. If the immigrant had a cow, she was left unstalled for the first year, because there was no time to make a shelter. Very soon, however, the German settler made adequate provisions for his livestock, and it is said that the German settlers could be told by the fine barns they built.

Cattle Seldom Housed

The early English, Scotch and Irish farmers scarcely ever housed their cattle. They gave all their attention to clearing the land and growing cash crops like wheat and rye. This early emphasis on cash grain crops and the successive cropping that ensued rapidly exhausted the soil and made it necessary to give more attention to crop rotation, the growing of clover, and the breeding of livestock.

A three-field plan of conserving soil fertility in which one field was permitted to remain fallow each year was adopted by many of the German and French farmers. The system was established by law in several European countries at that time.

The use of lime and gypsum as fertilizer and the seeding of clover were introduced as improved farm practices about 1770, according to historians. The first gypsum was brought to Pennsylvania as ballast in a ship from London and thrown out on a wharf at Philadelphia without knowledge of its value. Since gypsum had been used in Germany for some time, some of the early German farmers recognized the pile on the wharf and secured permission to use it.

A New Business Started

Not long afterwards, pulverizing imported gypsum became a business in Pennsylvania. It is reported that one of the first men in the business started with a hand mill, then changed to a horse mill and finally to a water mill.

Growing clover in colonial Pennsylvania was accomplished in a manner very similar to the present practice on many farms. It was seeded in the spring in wheat or rye, cut the next summer for hay and seed and then followed by corn.

It is said that before the general introduction of clover, many farmers allowed fields to be fallow for five or six years, until completely overgrown with briers and weeds of all kinds in the hope that the fertility would be restored by nature.

The farm implements used by farmers in those early days were a great handicap to extensive cultivation. Prior to 1776, the so-called hookplow, and the long wooden plow, both poorly adapted for a satisfactory job of plowing, a brush harrow and a triangular wood harrow were the important implements in the field. It is reported that little attention was given to the time, depth and manner of plowing by the colonial farmers.—Geo. F. Johnson.

"I thought my old separator was all right but my NEW De Laval *is saving me over* $96.00 a year"

WE USE THE DE LAVAL Cream Separator

JUST like hundreds of thousands of other cream separator users, this man thought his old machine was skimming clean. Yet when he tried a new De Laval he found it saved him $96.00 a year. Of course it stayed on his place.

A similar condition may exist with you. It's easy to find out. Ask your De Laval Agent to bring out a new De Laval and try this simple test:

After separating with your old separator, wash its bowl and tinware in the skim-milk. Hold the skim-milk at normal room temperature and run it through a new De Laval. Have the cream thus recovered weighed and tested; then you can tell exactly if your old machine is wasting cream, and what a new De Laval will save.

The new De Laval is the best separator ever made. It has the wonderful "floating bowl" and other improvements. It is *guaranteed* to skim cleaner. It is easier to run and handle, and lasts longer. For 48 years De Laval Separators have led the world.

7 SIZES Hand-Electric-Belt $6.60 to $14.30 DOWN Balance in 15 Easy Monthly Payments

The Adams County Baby Beef Club

(Continued from page 3)

and eventually to erase that "garlic of exploitation" by the business men of the farmer and the reverse.

The boys and girls were trained to think farm problems thru; they gained in the course of the project, faith, courage, vision, initiative, good sportsmanship, and technical knowledge. By helping farm boys and girls to help themselves, we are building toward a better rural life, and more prosperous communities, for we are molding solid citizens, and leaders of the future.

Club work leads to profit in farming which is the step toward satisfactory living. It influences many to elect agriculture as their vocation. Early training and association always have a marked influence upon farm boys and girls, in their thought and activities as men and women. And even tho many will not choose agriculture as their vocation, we know that we have always derived some of the most virile manhood and womanhood from the farm.

Final Event of the Year

The final event of the beef club for the year was the entertainment of the members and their parents by the Gettysburg Chamber of Commerce, the Lions and Rotary Clubs at a dinner in the St. James Lutheran Church, Monday evening, February 8th. About 200 sat down to a meal served by the Mite Society of this church.

Tasty roast baby beef was the basis of the meal and was the product grown and fed by Misses Nadine Garret and Martha Durboraw in the Baby Beef Club just closed. It can be truly said that every member ot the beef club ended the year's work full of their subject.

The encouragement given the boys and girls by the purchasers of their respective calves by letter from these purchasers has made each and every member more enthusiastic for doing a better job next year. Briefly summarized these letters have given the boys and girls the dressing per cent of the calves together with congratulations on the way each member put finish on these yearlings. They stated that the breeding and feeding of such cattle is a work that is very badly needed in the state of Pennsylvania and that they, the packers, will always be glad to cooperate and encourage the handling of well-bred livestock and pay full prices for such.

Preparation of Fleece

THE following suggestions for preparing the fleece for market are offered by the United States Department of Agriculture:

Shear the sheep when the wool is absolutely dry; never when there is any moisture in the fleece.

The sheep should be shorn only on a smooth, dry surface, preferably a planed board flooring; never on the dirt.

Care should be taken to keep the fleece intact. Avoid second cuts, which reduce the average length of the staple.

Clip all tags from each fleece and pack separately. Never permit the tags to remain in the fleece.

Fleeces should be prepared with the flesh side out; never the weather side.

Fold, roll, or use fleece box for preparing the fleece.

Tie each fleece separately. Never tie two fleeces together, nor pack and market untied wool.

Use only enough twine to tie the fleece securely.

Don't Use Binder Twine

Paper or hard glazed surface twine should be used. Never use sisal or binder twine.

Never permit the fleece to come into contact with chaff, hay, dust, or any other foreign material.

Place the tied fleeces in regulation wool sacks or cover them with canvas or new burlap.

Select a clean, dry place for storing the wool until sold. Never permit the wool to lie upon the ground nor store it in a basement.

Keep the white and black wool separate. Never permit any portion of black wool to be mixed thru the white.

Separate the burry, seedy, cotted, dead, black, and gray fleeces from the clean, white, well-grown wool, and pack separately. Never pack all grades together indiscriminately.

Francis Murren and his first-prize animal which sold for twenty-five cents per pound. Esther Hostetter is shown with her baby beef which won the second prize at the Harrisburg show.

Feed Market Situation

THE feed market continued generally weak since our last report but price declines of most feeds have apparently been checked by lighter offerings and a slight improvement in demand. The production of wheat feeds is being restricted by small flour sales but the supply continues ample for current needs. The mill feed market in the central western states developed a firmer undertone as a result of buying in larger quantities by the southeastern feed manufacturers and jobbers in nearby territory. Spring wheat feed markets, however, did not share in this improved demand and offerings of both spring wheat, bran and spring wheat middlings continue in excess of demand. The expected increase in demand for middlings has not materialized and the market is very weak.

High protein feeds steady but demand not active. Offerings of linseed meal increasing and resellers are offering meal below prices of the northwestern crushers.

Cottonseed Meal Held Firm

Cottonseed meal is being more firmly held in the southwestern markets where some mills have closed down for the season. Holders are not pressing their supplies on the market but are asking a slight premium for meal for deferred shipment. Demand, however, has not broadened materially and prices have held practically unchanged.

Production of corn feeds continues heavy. The supply of both gluten and hominy feeds is large with demand only moderate. Gluten feed prices were reduced $1.50 during the week but hominy feed prices held practically unchanged. The lower prices have not increased the demand which is being restricted by the cheap grain prices.

Alfalfa meal market dull with demand very light. The lower prices of bran and other feeds have cut down the demand for alfalfa meal.

Tobacco Letter

A LITTLE buying has been done in Lancaster County within the past two weeks, and the prices have shown a slightly upward trend. Buyers and independent packers were paying thirteen cents a pound for wrapper grades and three and four cents for fillers. According to present indications, growers will face the spring season with about half of the 1925 crop still unsold.

That there will undoubtedly be a drastic cut in the acreage of tobacco produced here next year was indicated at the March meeting of the Tobacco Growers' Association this week. Of the large number of tobacco men in attendance, all but one stated that they had decided to cut their tobacco land. Reductions of from fifty to one hundred per cent were reported by growers. President Creamer sounded a note of warning, declaring that a big reduction would be very harmful, as it would make the market fluctuate violently, and would probably bring on over-production the following year.

A small group of growers met in Lancaster last week to hear C. R. Titlow, Baltimore, explain means whereby the Federal Intermediate Credit Bank could aid in financing tobacco growers of the county in holding their unsold tobacco. An effort is to be made to form a Lancaster County Agricultural Credit Association, and to procure a government bonded warehouse here.—Lancaster, Pa., March 11.

Medical Examiner—What disease did your father die of?

Applicant for Life Insurance—I don't remember, Doctor, but it was nothing serious.

Get These Facts!

SUGARED SCHUMACHER FEED plus high protein concentrates, makes milk most economically and turns a certain sure profit for the dairyman.

W. F. Whittier, Stockdale Guernsey Farm, Lebanon, Pa., writes:

> "With my milking herd I use the following mixture:—800 lbs. Sugared Schumacher Feed, 200 lbs. Gluten Feed, 200 lbs. Oil Meal. My herd returns me $3.26 for every dollar expended for feed, which is very satisfactory indeed."

SUGARED SCHUMACHER FEED will improve the value of high protein feeds and rations by widening their variety, adding to their palatability, enriching their mineral content, and increasing their total food value.

MOST OF ALL, SUGARED SCHUMACHER FEED WILL DISTINCTLY LOWER FEED COSTS, MAINTAINING HIGHEST PRODUCTION and EXCELLENT CONDITION.

SUGARED SCHUMACHER FEED stands ready to serve every dairyman. Get your needed supply today.

White Bread or Brown?

Bake the Kind Rich in Minerals and Vitamins

"BUT my family does not like brown bread!" is the exclamation of many a housewife who realizes that brown bread is rich in minerals and vitamins and, from a nutritional standpoint, cheaper. White bread will not promote growth or maintain health in experimental animals. It is a decidedly deficient food. The best part of the wheat has been removed in the milling and bolting.

Children may as well learn to like brown bread because it is better for them. It is also slightly laxative.

Can You Help?

PLEASE tell me how to make a Christmas cactus bloom at Christmas and a calla lily at Easter? When shall I put them in the cellar? When out-of-doors? How often should the soil be changed? Our lily had nine blossoms five years ago, but none since. Would cutting off the flowers prevent the plant from blooming again? Who can tell me? —S.

Well made rolls with nuts, dates or raisins in them are tempting. I had better success with brown bread when I kneaded a little more flour into it, making a stiffer dough than for white rolls. The flour made the most difference, as some graham flour has a slight bitter taste. That freshly milled from the local mill had a better flavor and was richer in food value than the flour put out by a large milling company to ship and keep for a long time, from which the germ of the wheat was removed. The best kind is the flour that gets bugs in it in hot weather—the bugs can't grow in white flour, for it will not maintain life in any animal.

Here is my favorite recipe for rolls which we eat with our breakfast coffee.

GRAHAM TEA ROLLS

- 3 cups graham flour
- 3½ cups white flour
- 2 cups milk
- ½ cup sugar
- 3 tablespoonfuls shortening
- 3 teaspoons salt
- 1 cake compressed yeast
- ¼ cup lukewarm water
- 2 eggs
- 1 teaspoon ground cinnamon

Scald the milk in a large enameled bowl, adding to it the sugar, shortening and salt. Dissolve the yeast in the water and add to milk when it has cooled to lukewarm. Add the beaten eggs then white flour gradually until the batter will not spatter, but is still quite thin. Let rise until frothy, or overnight. Then add the graham flour and cinnamon. Knead well using plenty of flour until it will not stick to hands or board, and so that no flour will have to be kneaded in later.

Place in greased bowl, turn over, so that top will be greased, let rise until doubled, knead down in the pan and let rise again if there is time enough. Then shape into rolls, placing well apart in greased pan, turning over, letting rise until doubled. Bake twenty-five minutes in a hot oven at 425 degrees. This makes four dozen rolls.

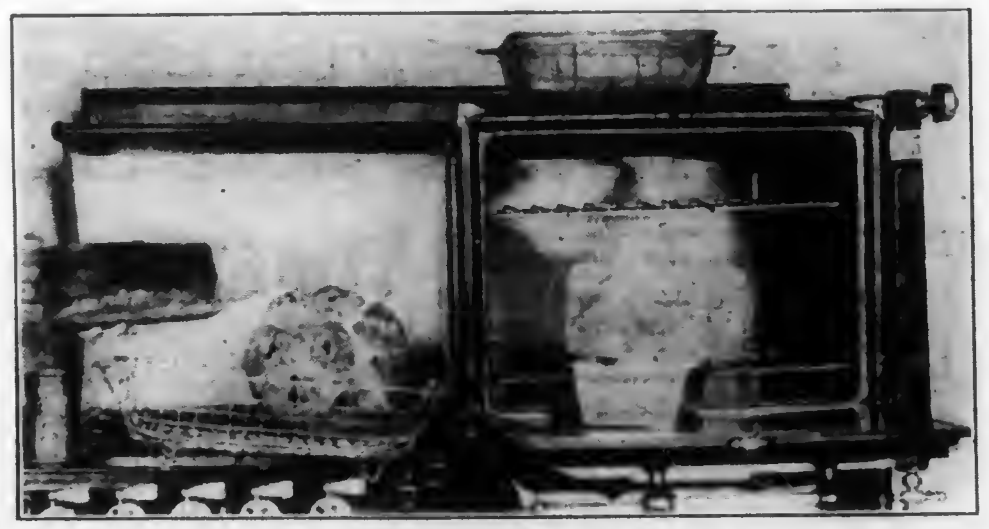
For variety, I roll part of the dough thin, spread with brown sugar and currants, roll up, cut, place cut side down, brush with melted butter and bake at 375 degrees.

GRAHAM BREAD

This is my regular white bread recipe, made exactly the same except that I use half brown flour, make dough a little stiffer, then bake loaves in a slightly slower oven. This makes two loaves.

- 1 pint liquid
- 1 tablespoon shortening
- 1 cake yeast
- 2 teaspoons salt
- 1⅓ tablespoons sugar
- 7 cups flour

As in all recipes the measurements are level. Potato water, which is clean and white, or sweet milk, is scalded, the shortening and sugar added, the yeast dissolved in one-quarter cup lukewarm water and added to the milk when lukewarm. Adding the salt with the last of the flour is said to retard the action of the yeast less, but I have not observed much difference.



Bread should be baked by temperature. When taken from oven it can be greased, if desired, then cooled in wire rack or laid across pan.

Add three cups white flour first, then the graham flour until the dough is stiff enough to knead. Work in plenty of flour, let rise until doubled, cut down to let out gas, let rise again, then shape half of it into a long piece, fold the ends under, and it will fit well into an individual loaf pan. The other half I generally make into a flat coffee cake, topping with a mixture of soft oily peanut butter and an equal quantity of confectioner's sugar, then a sprinkling of cocoanut. Let rise until doubled, and bake at 400, or a little lower so as not to burn the sugar.

If Recipe Is Doubled

If this recipe is doubled, you may use only one dry yeast cake, make a sponge and leave overnight. You may even increase the yeast to one cake per loaf to hurry it up, if using compressed yeast. Too much dry yeast is undesirable because of the cornmeal flavor in it. Keep in warm place for rising, or set in pan of water with thermometer registering between 70 and 98 degrees. The higher temperature hastens rising.

This recipe makes mighty good bread, but to make it still better for the days when we will use less meat, I add a cupful of mixed hazelnuts, Brazil nuts, hickory nuts, walnuts and pecans, dredging slightly with flour and adding before all the flour is kneaded in.

HEALTH BREAD

If a little is good, more is better, and this bread is of all brown flour. Less liquid is used. The kneading is more difficult since the mass ought to be soft and sticky at first and has to be kneaded until it is firm. More yeast is used, and a shorter period of rising, because a pure wholewheat flour ferments more quickly than white flour, and if the rising is prolonged overnight, the dough may become sour. Wholewheat bread calls for a slower, longer baking.

Dissolve two tablespoons molasses in a pint of warm water, add one compressed yeast cake, first dissolved in two tablespoons warm water. Let stand ten minutes, add one cup bran, mixed with one cup sifted wholewheat flour. Stir to a smooth batter, add three tablespoons melted butter. Mix a second cup of bran with three additional cups sifted wholewheat flour and two teaspoons salt, and knead all to a dough.

This very soft dough is kneaded until the gluten, so abundant in wholewheat flour, has absorbed the moisture, about fifteen to twenty minutes. Put in greased bowl, turn over. I grease my bowl with cooking oil. When doubled, knead lightly, shape into two loaves, let double, bake one hour at 325 to 350 degrees. This is a quite laxative bread.—Doris W. McCray, Iowa

How About the Boys?

FREQUENTLY we read on Our Home Page interesting and helpful articles about teaching the girls to cook and sew, etc., etc. I want to ask about the boys. What shall they do? What shall we teach them about the household duties? My children are boys, and they are three fine fellows, always glad to help mother and father.

My oldest son, a lad of thirteen, won first premium last September at our county fair for his maple walnut cake. He has helped do all sorts of housework since his eighth year and can get a very good meal entirely alone. I think most sonnies would enjoy helping if mother took the time to teach them. How many of the mothers who read Pennsylvania Farmer agree with me?

PRIZE MAPLE WALNUT CAKE

- 1 cup granulated sugar
- 1 cup butter
- 1 well beaten egg
- 1 cup sweet milk
- 1 teaspoon maple flavoring
- 2¼ cups sifted flour

Bake in three layers. Put together with the following filling:

- 3 cups confectioner's sugar
- 5 tablespoons milk
- 1 cup chopped walnut meats

Decorate the top with whole walnut meats.—Mrs. Eugene Williams, N. Y.

Prize Winning Hints

MY GREATEST helps in sewing are system, a notebook, pencil, empty boxes, sharp shears, and a large basket. It sounds funny, but listen! This spring when I pack away the family's winter clothes, I use a box for each one, marking the name on the outside. I immediately make a list of all garments needed for the following winter. Next I sort out garments worth making over, pin on a slip, marking for whom intended, and cross that need off the purchasing list. These "remakes" are put in my rainy day basket.

Needs Are Then Entered in Book

The list of garments and making materials needed is carefully entered in my notebook. When in town looking over bargains, I know in a moment exactly what is needed by referring to the book. No useless buying for me, since I buy for a family of twelve. Whenever I have time garments are cut out (sharp shears), marked, and tossed in the rainy day basket.

When along comes the rainy day, I am all ready to get at my sewing. Many folks spend half a day getting ready. This may not be what our editor meant, but here is mine of what she asked for—my greatest help in sewing.—A Reader.

Greens in Winter

JUST at this season we are greatly enjoying the good old dandelion greens. We preserved them in salt, and after a thoro soaking in cold water, we cook them with a small piece of salt pork, and just water to cover. Add a generous pinch of soda, cook slowly till very well done.

Preserving Directions

Pack tightly in a stone jar, the carefully cleaned, select greens. The early dandelions are best. Sprinkle salt over the layers as you pack, using a quart of salt to two gallons of greens. They will shrink and shrink, so you can keep refilling from day to day. They will make their own brine but I always make some to pour over at the finish. Add salt to rapidly boiling water, until it can dissolve no more.

When cold pour in to fill the jar to the top, after you have placed the cloth, board and weights. Watch them, and keep the tops covered at all times, for evaporation might start decomposition.—Clarice Raymond, N. Y.

Care of Silk Garments

I HAVE recently tried a new darning hint of French origin, and find it a great help. When silk stockings become worn at the heel and the darning peeps above the slipper top, sew a tuck one half inch deep across the base of the heel. This brings the darned place down out of sight, causes no discomfort to the wearer, and helps out generally in mending and prolonging life.

Silk stockings, gloves and underwear are affected by the action of the alkali in body perspiration, and also by the same chemical in many soaps. Both may be overcome by using vinegar in the final rinse water, when washing them. Use one tablespoonful to one gallon water.—E. R. D.

Chevrolet has become the world's greatest builder of gear-shift automobiles by building a quality car to sell at a low price—by providing the greatest value for your automobile dollar.

Now, in the Improved Chevrolet, there is greater quality than ever before, a performance never before approached in any low-cost car.

The new, flexible, three-point motor suspension makes for quieter, smoother operation. Lighter pistons and pins give a quickness of throttle response that is remarkable. A re-designed motor head with larger cooling area around the valves provides greater motor efficiency.

The generator is now driven with an endless V-shaped silent belt. The oil pump is located in the crankcase so as to insure positive, noiseless motor lubrication under all conditions.

Long semi-elliptic springs of new design provide pillowy comfort on rough roads. Striking new colors in Duco finish lend a new beauty to all models.

Drive this car where you will—over country roads or boulevards. Subject it to the most rigorous tests you can devise. Plow through mud and sand. Rush up hills that balk bigger and higher priced cars. It is only by actually driving the Improved Chevrolet that you can experience the revelation it affords.

But this is not all. True, Chevrolet offers you the world's finest low priced car. True, the Improved Chevrolet surpasses anything you ever believed possible in a car in this price class. But in addition Chevrolet has actually lowered its prices! Here is a distinct achievement that establishes a new record in the automobile industry—that establishes a new measure of motor car value, beyond question the greatest in the world.

See the Improved Chevrolet. Ride in it at your first opportunity. Call on your nearest Chevrolet dealer.

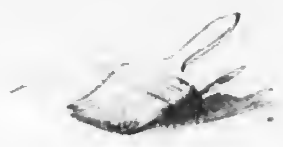
INTENTIONAL SECOND EXPOSURE



WHY you'll like these paints

FIRST, because you know that any product under the Cover-the-Earth trade-mark is exactly as represented.

Second, because you know that every product is the best product of the kind it is possible to make.

Third, because such extraordinary long life as Sherwin-Williams put into their products gives the sort of real economy that a good business man recognizes.

You will find these products in the live paint store known as *Paint Headquarters*, at your trading center. Look for the sign and for the famous "Painting Guide" which gives the authorized Sherwin-Williams recommendations.

Be sure to fill in the coupon given below and get a free book of valuable information.

The Sherwin-Williams Co., *largest paint and varnish makers in the world*, 661 Canal Road, Cleveland, Ohio.

SHERWIN-WILLIAMS

Flat-Tone for Walls

Beautiful, Economical, Washable, Fadeless. Your choice of plain, blended or beautiful multicolor effects to harmonize with your furnishings. Readily handled by following directions. Specified on the Farm Painting Guide.

SHERWIN WILLIAMS

"Porch and Deck" and SWP

"Porch and Deck" is made expressly to stand tramping feet and exposure. Dries with a tough, long-wearing surface. Splendid gloss—eight attractive colors.

SWP is the best house paint money can buy. It goes farther than cheap paints and far outlasts them—a double economy. Thirty-two beautiful colors—all non-fading.

SHERWIN-WILLIAMS

Ebonol and Roof Cements

Ebonol is a black paint for general utility and is specially valuable for roofs. Elastic Roof Cement (plastic) is recommended for repairing flashing of walls and chimneys—Liquid Roof Cement for re-surfacing leaking metal and composition roofs.

Months of Solid Wear

built into every "U.S." Blue Ribbon boot and overshoe

"U. S." Blue Ribbon boots are made with sturdy gray soles. The uppers are either red or black—knee to hip lengths.

THESE new "U. S." Blue Ribbon boots and overshoes are built to give the longest wear a boot or overshoe can give.

They're made with a thick, oversize sole—tough as an automobile tire. In the uppers is put rubber ***live as an elastic band***—so that constant bending and wrinkling won't crack or break it. The reinforcements are the strongest ever used in boot construction. They give you all the rugged strength you need.

"U.S." Blue Ribbons will give you a new idea of how much wear can be built into a boot or overshoe. They'll stand the wear and tear. You can depend on them every time. And they've got all the flexibility and comfort you could ask for. Try a pair ***and prove it!***

United States Rubber Company

FIVE TIMES ITS LENGTH! *That's how much you can stretch a strip of rubber cut from any "U. S." Blue Ribbon boot or overshoe. It resists cracking or breaking—stays flexible and waterproof.*

The "U. S." Blue Ribbon Walrus

slips right on over your shoes. Its smooth rubber surface washes clean like a boot. Made in red or black—4 or 5 buckles.

Blue US Ribbon

A SUPERIOR RUG OF GENUINE CORK LINOLEUM

On the Floor—Armstrong's Printed Linoleum Rug, Pattern No. 827.

Above: Armstrong's Printed Linoleum Rug, Pattern No. 926

Below: Armstrong's Inlaid Linoleum Rug, Pattern No. 1010

She could hardly believe a rug so pretty could be so inexpensive

"Not only pretty—it's pretty enough for any room in the house—but so easy to clean, and there hardly seems to be any wear-out to it at all. It's real linoleum."

IT'S a wise and happy housekeeper who can say her smooth-surface rug is *real linoleum*. There is all the difference in the world! Softer, more resilient and flexible, it will out-last a rug made of inferior material.

Armstrong's Linoleum Rugs are genuine cork linoleum, from the printed pattern on the surface right through to the sturdy burlap back. Cork to make it springy and wear-resisting, burlap to give it strength. The moment you *feel* an Armstrong's Linoleum Rug, you know it is a *better* rug. Bend it in your hands. Note how soft and flexible. Compare it with any other smooth-surface rug. There is little difference in price, yet an Armstrong's Linoleum Rug gives so much longer wear and far greater satisfaction—and that means better value for your money! Its cost is surprisingly low, too.

Remember, when you are buying a smooth-surface rug if it hasn't a burlap back it isn't linoleum. Remember too, that Armstrong's Linoleum Rugs come in the larger room sizes, 12 ft. x 12 ft., and 12 ft. x 15 ft., as well as the smaller sizes.

"RUGS OF PRACTICAL BEAUTY"—Twenty-eight pretty patterns to choose from, all illustrated in full color in this attractive booklet. Send for it today. It is free.

THEY WEAR—AND WEAR—AND WEAR

PLAN AND WORK

Don't Miss the Joy That Comes with Planning

DID you ever meet one of those persons who will tell you that it does not do any good to plan? What a lot of joy those people miss. Not even the most optimistic of us expect all our plans to work out but there is pleasure and profit, too, in planning; pleasure because everyone likes to build air castles, and profit because with a definite goal we always accomplish more.

I believe the reason renters are so often dissatisfied is because they lose the joy of planning. When buildings are inconvenient, and one is trying to pay for a home, he can plan and make changes as fast as finances will allow. The renter usually must endure his surroundings. For this reason it seems best to try to own a home even if one must begin in a very small way.

Make Work Easier if Possible

People paying for homes go for years before they are able to have expensive labor-saving devices, tho every effort should be made to make work easier as fast as possible. One dollar spent for dishwashing equipment will save many, many hours of time in the course of a year. Why not enjoy it while waiting for current to run an electric washer?

Plans without work are, of course, useless. Work to fulfill your plans and let others know what your plans are, very often you will get a boost, probably not in paying off the mortgage but in lesser ways in which farm people may help one another.—Mrs. Perley W. Lawton, Pa.

Dyeing Black

A GOOD black may be dyed over any shade except dark brown or red with straight black dye. If you desire black over brown or red, use about one-fourth package of navy blue with each package of black. The blue kills the rusty effect which brown or red is apt to give a black dyeing.

The material should be weighed carefully while dry and the dye used according to the weight of the material.

The correct amount of dye for the weight of material is important in dyeing black because less dye than required will give a bluish or grayish black and too much will give a bronzy black due to excess color on the surface of the fiber.

It will be necessary to redye a grayish black, but a bronzy overdye can be remedied by washing off the excess dye with hot water and mild soap suds.

There are three essential points for all successful home dyeing. First, use correct amount of dye; second, use a large dye receptacle for even penetration of color; third, stir constantly. On these three points the depth and uniformity of color depend.

Sandwiches for Lent

DURING Lent when we are using less meat, a very delicious and nourishing sandwich can be made using the following bread with butter.

DATE LOAF

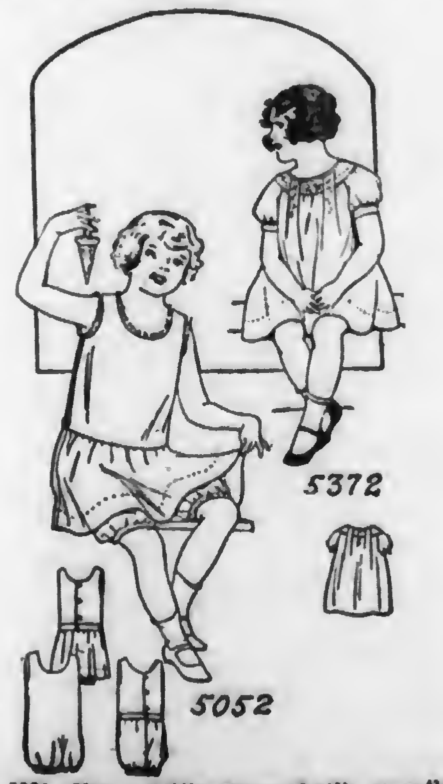
1 cup chopped dates
1 teaspoon baking soda
¾ cup boiling water
¾ cup brown sugar
1 tablespoon shortening
1 teaspoon vanilla
1¾ cups flour
½ cup chopped walnuts

Pour boiling water over soda and dates, and let cool. Then mix the sugar and shortening. Add beaten egg yolk, flour and vanilla. Combine the mixtures, add beaten egg white and nuts. Bake three-quarters hour in slow oven.—Betsey Ford.

These Are Easy to Make

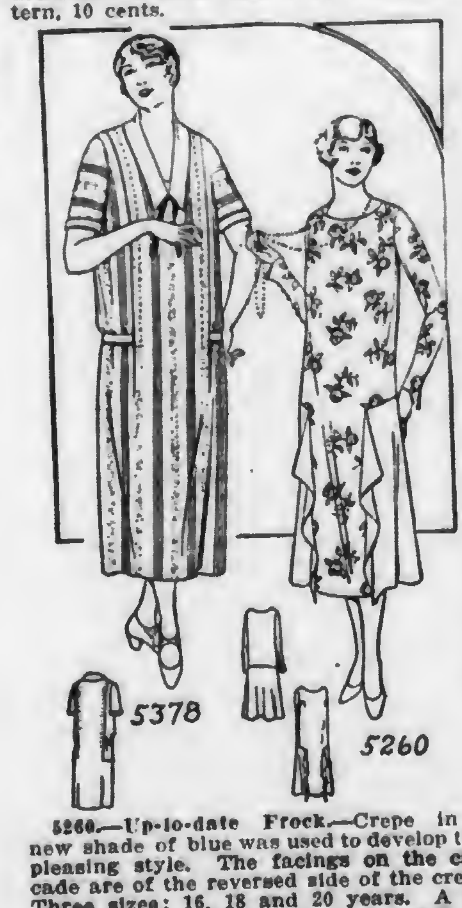
Directions for Ordering.—Give figures and letters of each pattern exactly as printed at beginning of each description. Give bust measures when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 261 S. Third Street, Philadelphia, Pa.

5052.—Practical Undergarment.—This model comprises a petticoat, bloomers and waist. The petticoat may be omitted. The back of bloomers and petticoat are finished in drop style. Muslin, cambric, or crepe could be used. Five sizes: 4, 6, 8, 10 and 12 years. To make the garment as illustrated for an eight-year size will require 2⅝ yards of 36-inch material. If petticoat is omitted 1½ yard will be required. Pattern, 10 cents.



5372—For a Little Tot.—Challis or voile would be suitable for this style. It is also pleasing in gingham, crepe and China silk. Four sizes: 2, 4, 6 and 8 years. A 6-year size will require 2¼ yards of 32-inch material. Pattern, 10 cents.

5378.—Attractive Morning Frock.—Linene, gingham, crepe, or percale could be used for this model. Nine sizes: 38, 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. A 44-inch size requires 4¼ yards of 36-inch material, with ½ yard of contrasting material for facings on collar, cuffs and belt. The width of the dress at the lower edge is 2⅛ yards. Pattern, 10 cents.



5260.—Up-to-date Frock.—Crepe in a new shade of blue was used to develop this pleasing style. The facings on the cascade are of the reversed side of the crepe. Three sizes: 16, 18 and 20 years. A 16-year size, if made as illustrated, will require 1⅝ yard of plain material and 2⅛ yards of figured material 54 inches wide. Without sleeves 1½ yard of figured material is required. The width of dress at lower edge is 2¾ yards. Pattern, 10 cents.

Send 10c in silver or stamps for our up-to-date spring and summer 1926 Book of Fashions.

GOOD BAKINGS

If you want bakings that will make anybody's mouth water—that are a credit to your skill as a cook—use Calumet.

If you want bakings that are perfect in taste and tenderness—use Calumet.

If you want bakings that are beneficial and wholesome—use Calumet.

Calumet is thoroughly good—in quality—in purity. It cannot produce anything but the best of good bakings.

Every ingredient used officially approved by U. S. Food Authorities.

A good old Friend

Remember the old-fashioned mustard plaster Grandma pinned around your neck when you had a cold or a sore throat?

It worked, but my how it burned and blistered!

Musterole breaks up colds and does its work more gently—without the blister. Rubbed over the throat or chest, it penetrates the skin with a tingling warmth that brings relief at once.

Made from pure oil of mustard, it is a clean, white ointment good for all the little household ills.

Keep Musterole handy and use at the first sign of tonsillitis, croup, neuritis, rheumatism or a cold.

To Mothers: Musterole is also made in milder form for babies and small children. Ask for Children's Musterole.

INTENTIONAL SECOND EXPOSURE

ICE-BOUND HEARTS

By James Oliver Curwood

HOW THE STORY STARTED

AT POINT FULLERTON, 1000 miles north of civilization, Sergeant William MacVeigh concluded his semi-annual report to the commissioner of the Royal Northwest Mounted Police. "I have made every effort to run down Scottie Deane, the murderer. I have not given up hope of finding him, but I believe that he has gone from my territory. . . ." On his bunk in a corner of the little cabin lay his comrade, Private Pelletier, sick, almost to madness after nine months of loneliness.

Half an hour later MacVeigh set out for Fort Churchill, 450 miles across the ice to deliver the report, get medicines and letters for Pelletier from the girl back home. While in Churchill a half-breed brought word he'd seen a white man and woman ten miles south of the Maguse River. A white woman in this region was unusual, her reason for being there so puzzling, that MacVeigh decided to hunt for them.

In the silent loneliness that night he came face to face with a white woman, alone. In a long, rough box on a toboggan, she was taking her dead husband back to her people 200 miles away. Billy promised to see her safely to her destination, the Little Seal. Later around the fire he told her of Pelletier, of their loneliness, of his own longing for the sight of a woman, and of the girl who had failed him and married another fellow. "I'd like to let you know—some way—what you've done for me. You—and this blue flower."

Before pitching her tent he scattered bakneesh vine over the box "in honor of the dead," then, the tent pitched, drew the box in, and after bidding her good-night sat by the fire for hours. At midnight he went to bed—the storm wailing—and slept till late. When he awoke the bakneesh wreath hung on his tent "in honor of the living." In the woman's tent her balsam bed was empty, and a bit of paper pinned to the open and empty box was signed "Mrs. Isobel Deane." A few hours before the box had held the murderer Scottie Deane.

(Continued from last week)

HE FINISHED loading his pipe and lighted it, staring off into the spruce forest into which Scottie and his wife had fled. The entire force was on the lookout for Scottie Deane. For more than a year he had been as elusive as the little white ermine of the woods. He had outwitted the best men in the service, and his name was known to every man of the Royal Mounted from Calgary to Herschel Island.

There was a price on his head and fame for the man who captured him. Those who dreamed of promotions also dreamed of Scottie Deane, and as Billy thought of these things something that was not the man-hunting instinct rose in him, and his blood warmed with a strange feeling of brotherhood. Scottie Deane was more than an outlaw to him now, more than a mere man. Hunted like a rat, chased from place to place, he must be more than those things for a woman like Isobel Deane to cling to. He recalled the gentleness of her voice, the sweetness of her face, the tenderness of her blue eyes, and for the first time the thought came to him that such a woman could not love a man who was wholly bad.

And she did love him. A twinge of pain came with that truth, and yet with it a thrill of pleasure. Her loyalty was a triumph—even for him. She had come to him like an angel out of the storm, and she had gone from him like an angel. He was glad. A living, breathing reality had taken the place of the dream-vision in his heart—a woman who was flesh and blood, and who was as true and as beautiful as the blue flower he had carried against his breast.

In that moment he would have liked to grip Scottie Deane by the hand, because he was her husband and because he was man enough to make her love him. Perhaps it was Deane who had hung the wreath of bakneesh on his tent and who had scribbled the words in charcoal. And Deane surely knew of the note his wife had written. The feeling of brotherhood grew stronger in Billy, and the thought of their faith in him filled him with a strange elation.

THE fire was growing low, and he turned to add fuel. His eyes caught sight of the box in the tent, and he dragged it out. He was about to drag it out and throw it on the fire when he hesitated and examined it more closely. How far had they come, he wondered. It must have been from the other side of the barren, for Deane had built the box to protect Isobel from the fierce winds of the open.

It was built of light, dry wood, hewn with a belt-ax, and the corners were fastened with babiche cord made of caribou skin, in place of nails. The balsam that had been placed in it for Isobel was still in the box, and Billy's heart beat a little more quickly as he drew it out. It had been Isobel's bed. He could see where the balsam was thicker, where her head had rested. With a sudden breathless cry he thrust the box on the fire.

He was not hungry, but he made himself a pot of coffee and drank it. Until now he had not observed that the storm was growing steadily worse. The thick, low-hanging spruce broke the force of it. Beyond the shelter of the forest he could hear the roar of it as it swept thru the thin scrub and open spaces of the edge of the barren. It recalled him once more to Pelletier.

In the excitement of Isobel's presence and the shock and despair that had followed her flight he had been guilty of partly forgetting Pelletier.

By the time he reached the Eskimo igloos there would be two days lost. Those two days might mean everything to his sick comrade. He jumped to his feet, felt in his pocket to see that the letters were safe, and began to arrange his pack. Thru the trees there came now fine, white volleys of blistering snow. It was like the hardest granulated sugar. A sudden blast of it stung his eyes, and, leaving his pack and tent, he made his way anxiously toward the more open timber and scrub.

A few hundred yards from the camp he was forced to bow his head against the snow volleys and pull the broad flaps of his cap down over his cheeks and ears. A hundred yards more and he stopped, sheltering himself behind a gnarled and stunted banskian. He looked out into the beginning of the open. It was a white and seething chaos, into which he could not see the distance of a pistol-shot. The Eskimo igloos were twenty miles across the barren, and Billy's heart sank. He could not make it.

No man could live in the storm that was sweeping straight down from the Arctic, and he turned back to the camp. He had scarcely made the move when he was startled by a strange sound coming with the wind. He faced the white blur again, a hand dropping to his empty pistol holster. It came again, and this time he recognized it. It was a shout—a man's voice. Instantly his mind leaped to Deane and Isobel. What miracle could be bringing them back?

A shadow grew out of the twisting blur of the storm. It quickly separated itself into definite parts—a team of dogs—a sledge—three men. A minute more and the dogs stopped in a snarling tangle as they saw Billy. Billy stepped forth. Almost instantly he found a revolver leveled at his breast.

"Put that up, Bucky Smith!" he called. "If you're looking for a man, you've found the wrong one!"

The man advanced. His eyes were red and staring. His pistol arm dropped as he came within a yard of Billy.

"By ——, it's you, is it, Billy MacVeigh!" he exclaimed.

His laugh was harsh and unpleasant. Bucky was a corporal in the service, and when Billy had last heard of him he was stationed at Nelson House. For a year the two men had been in the same patrol, and there was bad blood between them. Billy had never told of a certain affair down at Norway, the knowledge of which at headquarters would have meant Bucky's disgraceful retirement from the force. But he had called Bucky out in fair fight and had whipped him within an inch of his life.

THE old hatred burned in the corporal's eyes as he stared into Billy's face. Billy ignored the look, and shook hands with the other men. One of them was a Hudson Bay Company's driver, and the other was Constable Walker, from Churchill.

"Thought we'd never live to reach shelter," gasped Walker as they shook hands. "We're out after Scottie Deane, and we ain't losing a minute. We're going to get him, too. His trail is so hot we can smell it. My God, but I'm bushed!"

The dogs with the company man at their head, were already making for the camp. Billy grinned at the corporal as they followed.

"Had a pretty good chance to get me—if you'd been alone, didn't you, Bucky?" he asked in a voice that Walker did not hear. "You see, I haven't forgotten your threat."

There was a steely hardness behind his laugh. He knew that Bucky Smith was a scoundrel whose good fortune was that he had never been found out in some of his evil work. In a flash his mind traveled back to that day at Norway when Rousseau, the half-Frenchman, had come to him from a sick-bed to tell him that Bucky had ruined his young wife. Rousseau, who should have been in bed with his fever, died two days later.

Billy could still hear the taunt in Bucky's voice when he had cornered him with Rousseau's accusation, and the fight had followed. The thought that this man was now close after Isobel and Deane filled him with a sort of rage, and as Walker went ahead he laid a hand on Bucky's arm.

"I've been thinking about you of late, Bucky," he said. "I've been thinking a lot about that affair down at Norway, an' I've been kicking myself for not reporting it. I'm going to do it—unless you cut a right angle track to the one you're taking. I'm after Scottie Deane myself."

In the next breath he could have cut out his tongue for having uttered the words. A gleam of triumph shot into Bucky's eyes.

"I thought we was right," he said. "We sort of lost the trail in the storm. Glad we found you to set us right. How much of a start of us has he and that squaw that's traveling with him?"

Billy's mittened hands clenched fiercely. He made no reply, but followed quickly after Walker. His mind worked swiftly. As he came in to the fire he saw that the dogs had already dropped down in their traces, and that they were exhausted. Walker's face was pinched, his eyes half closed by the sting of the snow.

THE driver was half stretched out on the sleigh, his feet to the fire. In a glance he had assured himself that both dogs and men had gone thru a long and desperate struggle in the storm. He looked at Bucky, and this time there was neither rancor nor threat in his voice when he spoke.

"You fellows have had a hard time of it," he said. "Make yourselves at home. I'm not overburdened with grub, but if you'll dig out some of your own rations I'll get it ready while you thaw out."

Bucky was looking curiously at the two tents.

"Who's with you?" he asked.

Billy shrugged his shouders. His voice was almost affable.

"Hate to tell you who was with me, Bucky," he laughed. "I came in late last night, half dead, and found a half-breed camped here—in that silk tent. He was quite chummy—mighty fine chap. Young fellow, too—almost a kid. When I got up this morning"—Billy shrugged his shoulders again, and pointed to his empty holster—"everything was gone—dogs, sleigh, extra tent, even my rifle and automatic. He wasn't quite bad, tho, for he left me my grub. He was a funny cuss, too. Look at that!"

He pointed to the bakneesh wreath that still hung to the front of his tent.

"In honor of the living," he read aloud. "Just a sort of a reminder, you know, that he might have hit me on the head with a club if he'd wanted to." He came nearer to Bucky, and said good-naturedly: "I guess you've got me beat this time, Bucky. Scottie Deane is pretty safe from me, wherever he is. I haven't even got a gun!"

"He must have left a trail," remarked Bucky, eyeing him shrewdly.

"He did—out there!"

CUT CUTA CUT CUT

As Bucky went to examine what was left of the trail Billy thanked Heaven that Deane had placed Isobel on the sledge before he left camp. There was nothing to betray her presence. Walker had unlaced their outfit, and Billy was busy preparing a meal when Bucky returned. There was a sneer on his lips.

"Didn't know you was that easy," he said. "Wonder why he didn't take his tent! Pretty good tent, isn't it?"

He went inside. A minute later he appeared at the flap, and called to Billy.

"Look here!" he said. And there was a tremble of excitement in his voice. His eyes were blazing with an ugly triumph. "Your half-breed had pretty long hair, didn't he?"

He pointed to a splinter on one of the light tent-poles. Billy's heart gave a sudden jump.

A tress of Isobel's long, loose hair had caught in the splinter, and a dozen golden brown strands had remained to give him away. For a moment he forgot that Bucky Smith was watching him.

HE SAW Isobel again, as she had last entered the tent, her beautiful hair flowing in a firelit glory about her, her eyes still filled with gratitude. Once more he felt the warmth of her lips, the touch of her hand, the thrill of her presence near him. Perhaps these emotions covered any suspicious movement or word by which he might otherwise have betrayed himself. By the time they were gone he had recovered himself, and he turned to his companion with a low laugh.

"It's a woman's hair all right, Bucky. He told me all sorts of nice things about a girl back home. They must have been true."

The eyes of the two men met unflinchingly. There was a sneer on Bucky's lips; Billy was smiling.

"I'm going to follow this Frenchman after we've had a little rest," said the corporal, trying to cover a certain note of excitement and triumph in his voice. "There's a woman traveling with Scottie Deane, you know—a white woman—and there's only one other north of Churchill. Of course you're anxious to get back your stolen outfit?"

"You bet I am!" exclaimed Billy, concealing the effect of the bull's-eye shot Bucky had made. "I'm not particularly happy in the thought of reporting myself stripped in this sort of way. The half-breed will hang to thick cover, and it won't be difficult to follow his trail."

He saw that Bucky was a little taken back by his ready acquiscence, and before the other could reply he hurried out to join Walker in the preparation of breakfast. He made a gallon of tea, fried bacon, and brought out and toasted his own stock of frozen bannock.

He made a second kettle of tea while the others were eating, and shook out the blankets in his own tent. Walker had told him that they had traveled nearly all night.

"Better have an hour or two of sleep before you go on," Billy invited.

The driver's name was Conway. He was the first to accept Billy's invitation. When he had finished eating Walker followed him into the tent. When they were gone Bucky looked hard at Billy.

"What's your game?" he asked.

"The golden rule, that's all," replied Billy, proffering his tobacco. "The half-breed treated me square and made me comfortable, even if he did take his pay afterward. I'm doing the same."

"And what do you expect to take—afterward?"

Billy's eyes narrowed as he returned the other's searching look.

"Bucky, I didn't think you were quite a fool," he said. "You've got a little decency in your hide, haven't you? A man might as well be in jail as up here without a gun. I expect you to contribute one—when you go after the half-breed, you or Walker. He'll do it if you won't. Better go in with the others. I'll keep up the fire."

Bucky rose sullenly. He was still suspicious of Billy's hospitality, but at the same time he could see the strength of Billy's argument and the importance of the price he was asking. He joined Walker and Conway.

(To be continued next week)

News and Notes

JUST fifty years after the invention of the telephone, a two-way wireless telephone conversation was carried on between England and the United States on March 7th. The words of the speakers in London were picked up at a station in Maine and sent 600 miles by land wire to New York, while the replies of the men talking in New York were broadcast from a station on Long Island. Different stations for sending and receiving were also used in England. The speakers, 3400 miles apart, could hear each other better than if they were only a mile or two apart and were talking over an ordinary telephone.

* * *

The coldest weather reported by a so-called first-order Weather Bureau station for the entire United States in 1925 was forty-one degrees below zero, registered at Canton, Saint Lawrence County, New York.

* * *

Williamsport, Pennsylvania, which once exported more pine and hemlock lumber than any other town in the United States, now buys lumber grown on the Pacific Coast. Building material grown on the shores of the Pacific has been shipped south past the coast of Mexico, thru the Panama Canal, up by Cuba and Florida to an Atlantic coast port and thence by rail to Williamsport, where it was bought by builders.

* * *

A six-mile tunnel is being bored thru the Continental Divide in Colorado, near Denver. The engineers are digging from both ends and expect to meet in the middle. The tunnel is over 9000 feet above sea level, and the mountains above it rise 12,000 feet above the sea. Fires will be banked in engines using this route, which shortens the distance between Denver and Salt Lake City 173 miles, and engine, train and all will be hauled thru the mountain by electric locomotives.

* * *

Clas Thunberg, a skater from Finland, recently made a world's record by skating a mile in 2 minutes 38 1-5 seconds, at Lake Placid New York. Says Time: Man has run a mile in 4 min. 10.4 sec.; walked a mile in 6 min. 25.8 sec.; swum a mile in 23 min. 34.5 sec. A horse has run a mile in 1.34 4-5 min.; a motor boat in 45 sec.; a motorcycle in 32.53 sec.; an automobile has sped a mile in 23.07 sec.; an airplane in 14.88 sec.

* * *

Bankers in Indiana have been going to school to study agriculture. Ninety-three of them recently took a two-day course at their state college, Purdue University, to study the relation of the farming industry to their business.

* * *

Vacuum tube amplifiers, similar to those used as radio loud speakers, were recently used by a motion picture producer in staging a great film spectacle in which 10,000 people were before the cameras. One man at the microphone directed all of those people and his forty-two camera men by means of the loud speakers hidden in various parts of the arena where the chariot race in Ben Hur was taken.

* * *

A Philadelphia baking concern was recently prosecuted by the State Bureau of Foods and Chemistry because it sold what is called "butter pound cake" which contained no butter.

OUR YOUNG PEOPLE'S FORUM.

From Forum Friends

Dear Cousin Ruth and Forum Friends:—It is very good coasting here. I wish some of the boys and girls that live in the town or city could coast with me. I have no brothers or sisters, and it gets very lonesome coasting alone. I get the dog and try to make him sit on the sled with me, but he won't. Altho he lets me pull him sitting on the sled alone.

I also have a pet cat who will ride on the sled. He is so playful he will not stay on long. He tries to get his feet under the runners.

I have been wondering if there is a Cousin Ruth. I think maybe it is just the editor of this paper. If there is, I wish she would put her picture on the page.—Dorothy Hill, Mercer County, N. J.

Oh, yes, there is a Cousin Ruth, I assure you! My picture has been on the page twice, tho once it was printed so poorly you never would have recognized me if you'd met me on the road!

COUSIN RUTH.

Dear Friends:—I am sending you a story:

The Story of Frances

Frances is my doll. She is twenty-five and a half inches long and weighs four pounds. She was given to me January 8, 1925. I named her after my mother who gave her to me.

My little sister, Laura, left her out in the rain twice and her face peeled off. Our neighbor, who is an artist, offered to paint her face for me. Now she is as good as new.

DOGGIE GOING FOR A RIDE
Sara Geinett, Juniata County, Pa.

She has a new pair of shoes and stockings. Mother is going to make her a new dress. It is more fun to play with her now.—Mary E. Walton, ten (X), Bucks County, Pa.

Dear Cousin Ruth and Forum Friends:—May I be one of your family altho I do not live on a farm? I live in a little town with about a thousand people. I am sorry to say we do not have a coasting place, but one hill that is just a small hill and mother does not let us go for she says it is too dangerous for there are too many there. When I go to see my cousin on the farm we have plenty of fun, for they have a big creek near their house. I always enjoy going there.—Margaret Mininger, eight (X), Montgomery County, Pa.

Dear Cousin Ruth:—I had a very good time this winter. I have a pair of ice skates and a sled. I often went coasting till nine o'clock.

Did any of you boys do any trapping this winter? I caught three skunks and lost three traps.

I live on a seventy-five-acre farm. Last summer I did about all the farm work. My father works in a store. I expect to go to high school next year. I take manual training in school. Next week we expect to make bird houses.—Joseph Shelly, (X), Lehigh County, Pa.

I hope you will tell Forum friends about the bird houses you plan to build.

COUSIN RUTH.

Dear Cousin Ruth and Forum Friends:—I received the Forum membership pin. It is very attractive. Thank you.

Our Sunday school class, "The Gleaners," with the aid of several others, gave a musical comedy called "Miss Ann Teek," February 22nd. We made sixty-five dollars.

Above my grandma's house on the hill a tall pine stands. It often whispers to me, so one day I wrote a poem about it. It is:

The Lonely Pine

Midway up the hillside
Stands a tall pine tree,
Covered with cones and needles,
Whispering ever to me.

When the birds come back from the south,
When the air from frost is free,
The pine tree on the hillside
Whispers ever to me.

When the days are hot and dry
The pine will proudly stand—
In rain, in sunshine, or in wind
A firm, proud sentinel of the land.

When autumn's days are here,
And the air is chilly, too,
The pine still whispers to the world,
Twinkling in frozen drops of dew.

When snowy winter comes
The cold winds murmur slow,
The tree, bedecked with flakes of gems,
Its wondrous beauty will show.

I think that this pine so tall,
As it whispers and sobs to me,
Wants me for its human friend
For it might lonesome be.

If I could stand serene,
When the cold winds strongly blow,
How proud, how happy I would be
I'd want you all to know.

But still I'd want a friend
To talk to once in a while
And whisper words of love to me,
And chat and sob and smile.

So I'm a friend of the old pine tree
As it whispers softly, "come—come,"
And I often sit beneath its boughs
When the twilight shadows come.

I hear it whisper so weird to me
In a language quite well I know.
If you listen, too, you will hear it say:
"Come where the pine trees grow."

I read lots these wintry days and I am always glad when Pennsylvania Farmer comes. Let's wake up, Fourm friends, and help our big Cousin Ruth to make the page a success.—Eliza Motter, (X), Fulton County, Pa.

Dear Cousin Ruth and Forum Friends:—We have about fifteen inches of snow on the ground here and I always think it is a hard time for the birds to get food. I scatter bits of food on the snow near my home where I can see them eating. I have been feeding a pair of cardinals which are very tame by now.

Last fall a little woodpecker came to our home and made a hole in a stump to build his nest this spring. The stump is about four feet from our well. He comes to the stump every day. I think a woodpecker is a very pretty bird.—Mary Burkett, (X), Bedford County, Pa.

Dear Cousin Ruth:—My class at school is making dresses this week. I do not like to sew by hand but like to sew on the machine much better.

Swedesboro, where I live, was one of the earliest settlements in New Jersey, and is one of the largest tomato shipping points. A large part of the sweet potato crop is raised near and shipped from here.

We have a fine high school and I hope to be going there in a couple of years.—Margaret E. Mattson, (X), Gloucester County, N. J.

Dear Cousin Ruth:—I live one mile out of Woolrich, a little village which has a woolen mill, church, schoolhouse and a store.

I live on a farm of 101 acres. We have about forty acres of woodland, eleven acres of pasture land and the rest my father farms.

OUT WITH MY CHUMS
*Gladys Knarr, Clinton County, Pa.

Here is my picture with two girl chums. I am in the chair. It was taken just before I left home for Mill Hall on a visit. I have not been able to walk since last July a year and I don't know whether I ever will be able to walk any more or not.

My father and sister, who take care of me, are very good to me. I also have two brothers who are also good to me. Mother died last May. —Gladys Knarr, ten (X), Clinton County, Pa.

Dear Cousin Ruth:—I am staying with my aunt and she gets Pennsylvania Farmer. She also has a lot of nice house plants, such as geraniums and coleus, also fuchsias and ferns. I like flowers very much and I will plant some of my own. Asters are my favorite while the sweet peas are first in my aunt's flower beds. I go to Smith Gap School and am in fifth grade. I have some fun skating and coasting.—Kermit Green, twelve (X), Monroe County, Pa.

Dear Cousin Ruth and Forum Friends:—I can plow, harrow and do about any kind of farm work. My dad digs clay and I do the plowing and get the land ready for him to sow the seed. I like to live on a farm.

There is some snow and lots of ice now. I like to go coasting down the hills. We got the electric lights in on November 6, 1925. They are very nice things to have on a farm.—Marvin L. Peters (X), Clearfield County, Pa.

OUR LITTLE FOLKS' PUZZLE CORNER

DEAR LITTLE FOLKS:—You will find out which animal it is that has this peculiarity if you will cut out the six irregular-shaped white pieces with black letters or spots on them and piece them together so that they form a circle. I feel sure that the animal will not be a strange one to you for there are usually several on a farm, and even city folks have them. When you have found the answer, send it to me on a POSTCARD so that it reaches me by March 27th. BE SURE TO SAY HOW OLD YOU ARE. The ten children sending in the correct answer, whose cards are the best in grammar, spelling, punctuation, penmanship and general appearance will each be awarded a set of pictures.

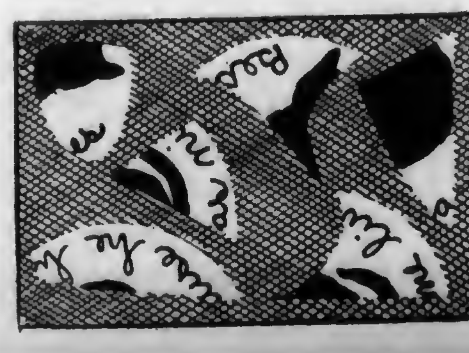
The Honor Prizes, bright and shiny pencils with a supply of leads, go to those Little Folks who send in correct, excellent answers to ten puzzles for ten straight weeks without missing,—one each week. Please remember that in order to win an Honor Prize your answers must be absolutely correct each week. Mistakes in spelling, punctuation, and failure to mention your age every time are only a few of the many errors that are made weekly.

Address all replies to the PUZZLE EDITOR, PENNSYLVANIA FARMER, 261 SOUTH THIRD STREET, PHILADELPHIA.

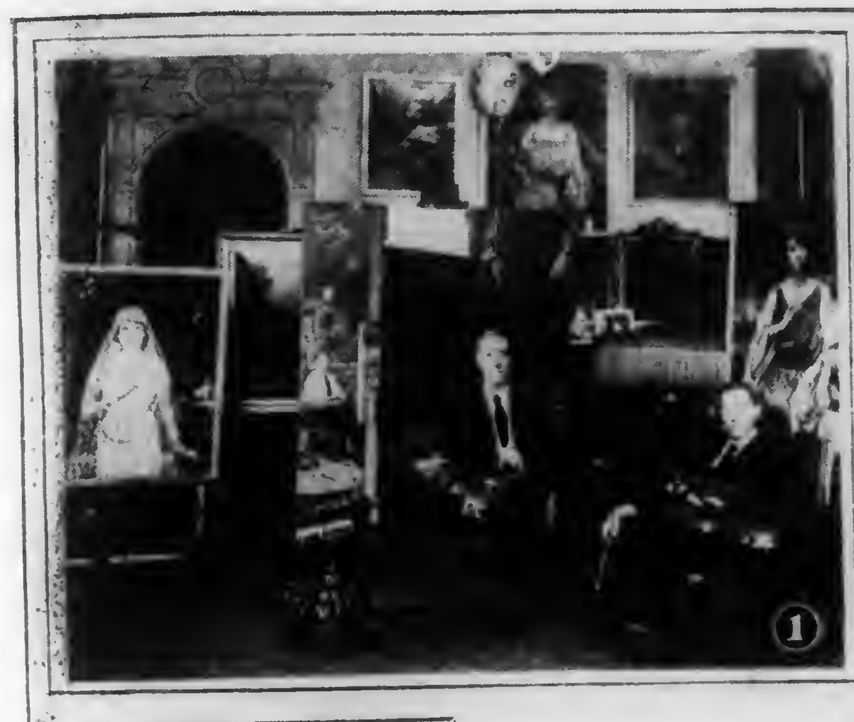
The answer to the puzzle published in the February 27 issue of Pennsylvania Farmer is: (1) FIR; (2) CEDAR; (3) DOGWOOD; (4) YEW; (5) PINE; (6) HEMLOCK; (7) ELM; (8) OAK; (9) ASPEN; (10) MAPLE; (11) BEECH; (12) WILLOW.

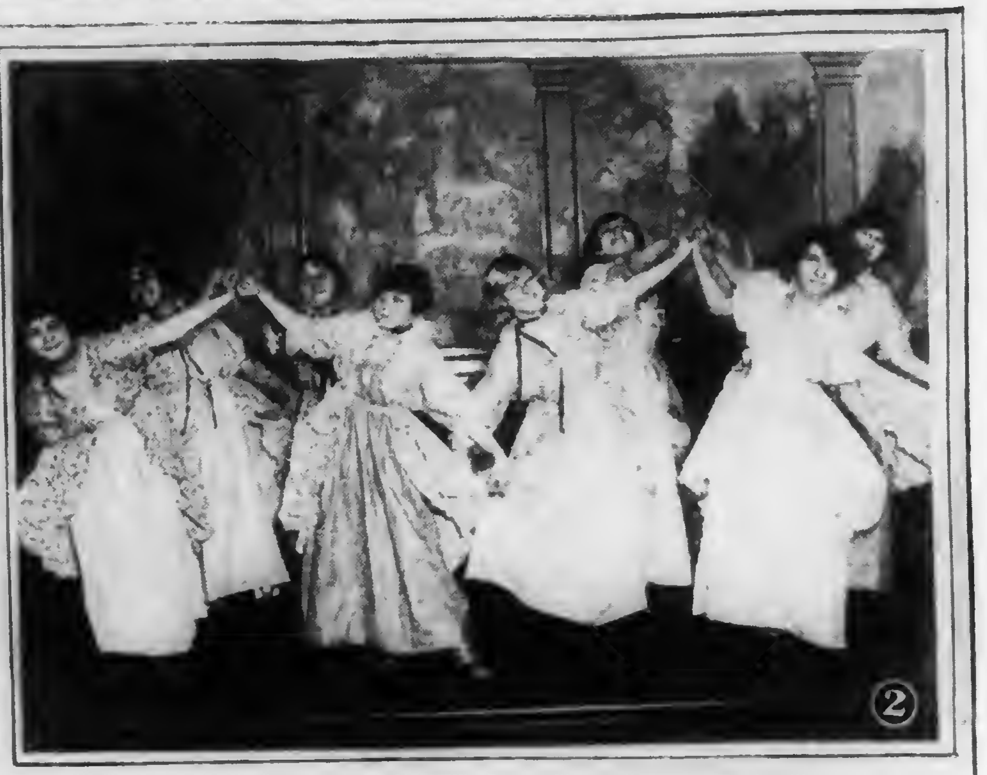
The puzzle prize winners are: Albert Astheimer, age 13, Royersford, Pa.; Alberta Beers, age 10, Elkland, Pa.; Marvin Eshleman, age 7, Lancaster, Pa.; Menno Eshleman, age 9, Lancaster, Pa.; Luella Mae Garman, age 10, Landisville, Pa.; Catherine E. Glaze, age 9, Montgomery, Pa.; Jennie Hovan, age 12, Somerville, Pa.; Wayne Kistler, age 10, Wanamaker, Pa.; Mary Motter, age 11, Marion, Pa.; Jean S. Stephens, age 8, Millerstown, Pa.

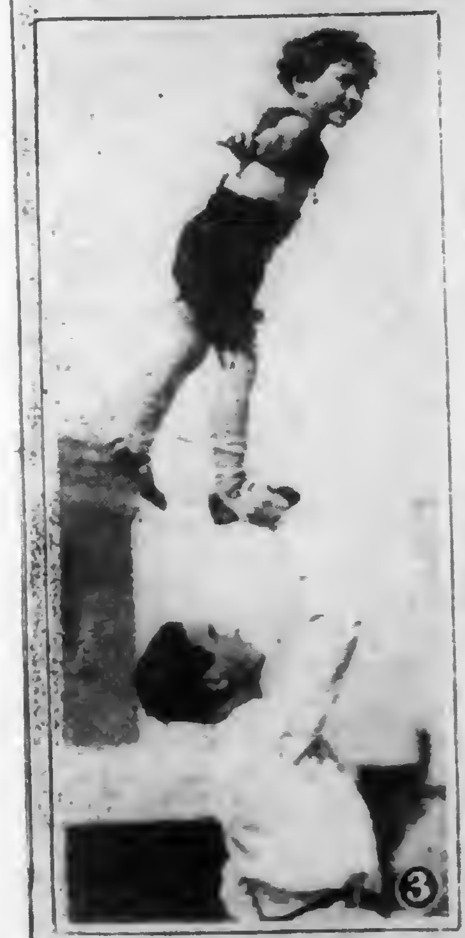
Which Animal Should Carry the Most Life Insurance?

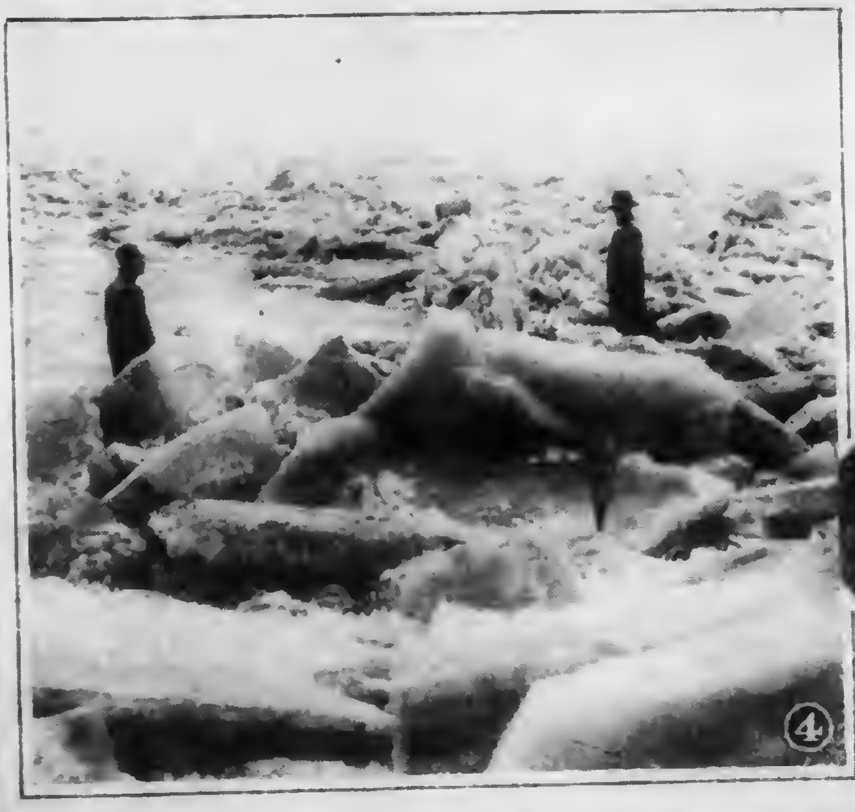


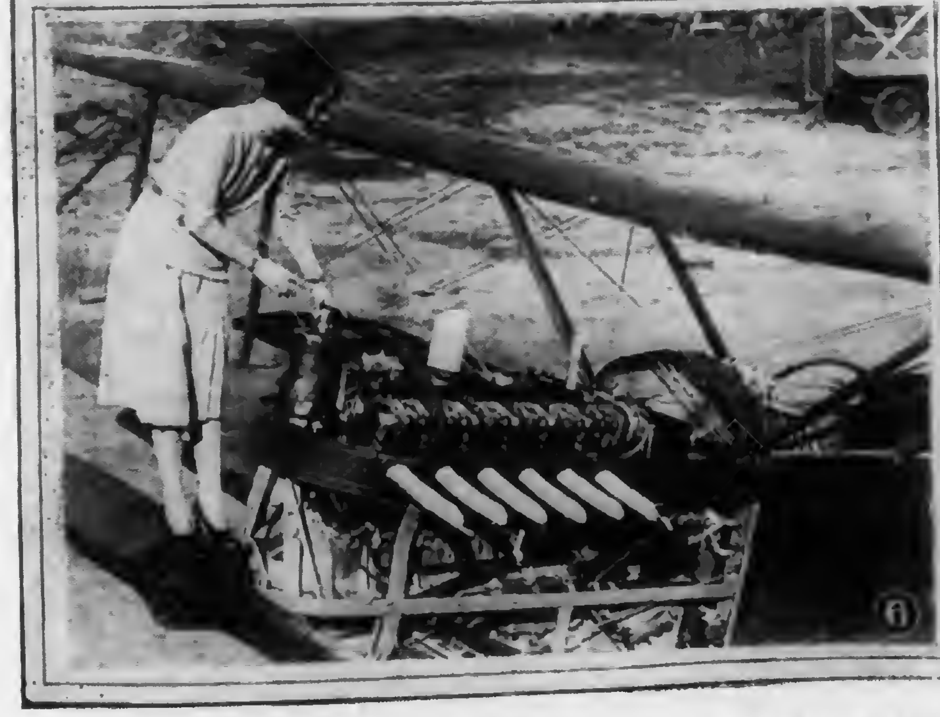
PASSING EVENTS IN PICTURES

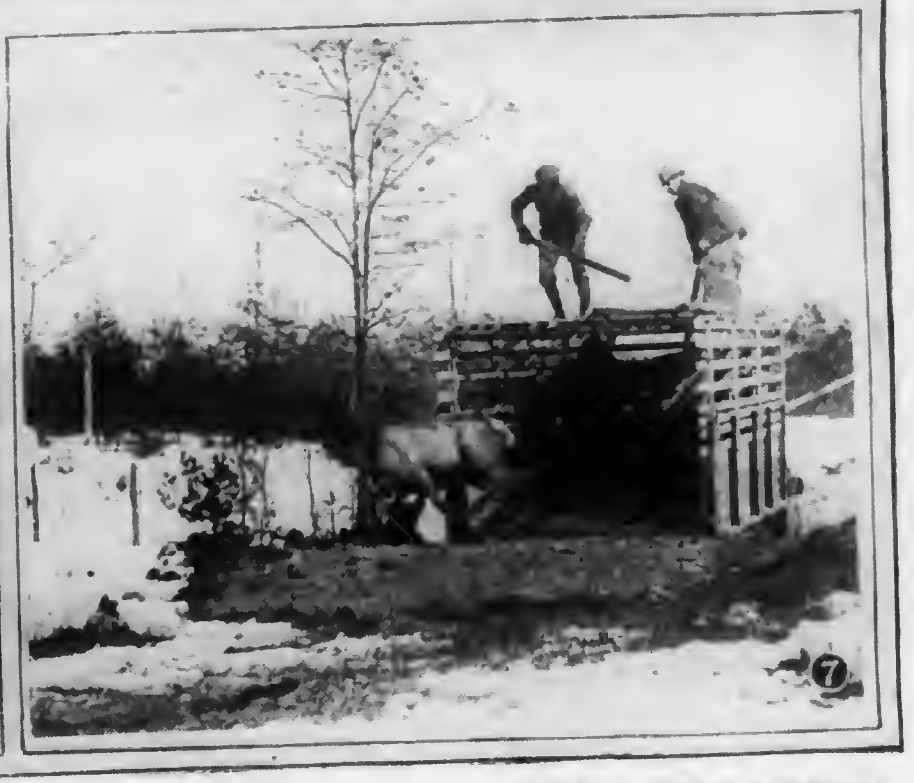






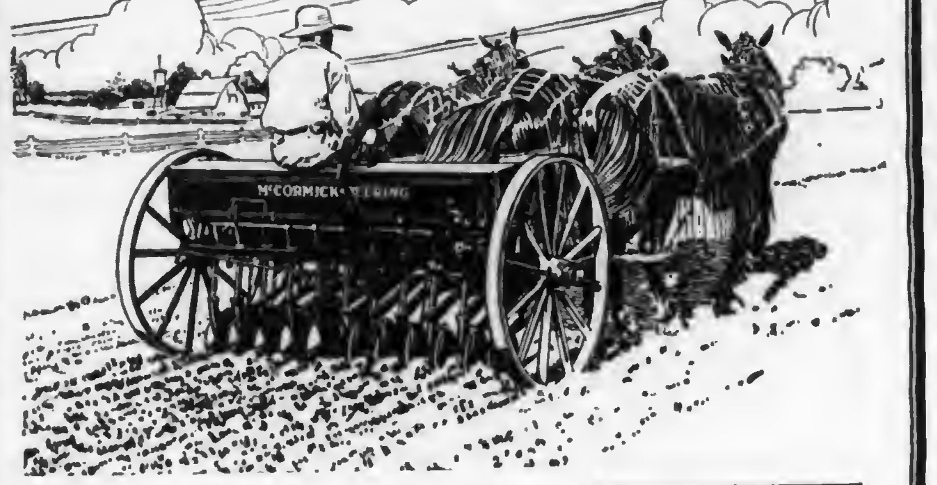






(Copyright by Underwood & Underwood.)

1.—Walter I. Cox, prominent English portrait painter, seated in his studio, beside the portrait which he painted of himself.
2.—Dancing the old-fashioned minuet of their grandmothers to celebrate their graduation from public school.
3.—Little Aimee Menard, five-year-old wonder gymnast of Los Angeles, is able to do all kinds of difficult stunts.
4.—Not only are scenes like this common in the arctic regions, but also in Pennsylvania, along the Susquehanna River, where this photograph was taken.
5.—President Coolidge doesn't have to go to the cashier's window for his monthly pay envelope, for Miss K. A. Shea brings it to him from the United States Treasury.
6.—A close up of the motor of the new Douglass mail plane which will operate between Los Angeles, California, and Salt Lake City, Utah, connecting with the trans-continental air mail service.
7.—One day last month 379 elk arrived in Middleboro, Massachusetts, from Dixon, Montana, where they will be fattened and killed for the eastern market.



For Over Fifty Years—

FOR OVER FIFTY YEARS these double-run and fluted-feed grain drills have been known and used by American farmers. Each year has brought improvements; today these good drills represent the finest seeding equipment the market offers. This nation-wide popularity is based on their excellent design, long life, and ability to do good work in every soil. See these good drills at the store of your local dealer.

$5 Down and You Can Buy Any WITTE Engine
Up to 10 H-P.

To PROVE that this "super-powered" one-profit, light weight WITTE will save you one-half the time, labor and cost of any job on the place I want to send it to you on a 30-day test at my risk. I guarantee it to do the work of 3 to 5 hired hands.

Nearly a YEAR TO PAY
Scrap the Old One—Pay a Little of It Down on the New WITTE
With my generous terms my engine pays for itself. Increases farm profits $500 to $1000 a year. Thousands say the WITTE is ten years ahead of any other make—simple and trouble-proof at rock-bottom, direct-to-you prices. Completely equipped with WICO Magneto, speed and power regulator and throttling governor. All sizes 2 to 25 H-P.

FREE—Write me today for my big, new, illustrated engine book and full details of my guaranteed test offer. No obligation, absolutely Free. Or, if interested, ask for our Log and Tree Saw, 3-in-1 Saw Rig or Pump Catalogs.—ED. H. WITTE, Pres.

Burns Kerosene, Gasoline, Gas-Oil, Distillate or Gas—Yet Delivers 25% or More Power. Cheapest to operate and guaranteed for a life-time. No cranking required. Compact and easily moved. Double, balanced fly-wheels with throttling governor that saves money. Fifty New Features—Write Me Today—a postal will do—for my Special FREE 30-Day Test Offer.

The Most Interesting Farmer I Ever Knew

A Typical Westerner

Letter A

THE most interesting person I ever knew is a typical westerner. He is a Nebraska farmer who came to our little community a year ago and with modest means purchased the village grocery store where three former merchants had failed in the course of five years. But Vede (let us call this man), soon gained other titles than merchant.

First, he proceeded to revive and equip a seemingly useless barn on his premises into a serviceable garage and blacksmith shop. Being a natural mechanic and working more reasonably than larger garages he soon established a fair business which grew so rapidly that he sent for a younger brother in the West to whom he gave the management of the new garage. The young man has since made good profits.

Last summer "Vede" took a neighbor's haying and has rented the farm on which he did the haying for another year. During the winter months, which time former merchants always found dull, "Vede" has busied himself with a large wood job, odd work on the electric line and the ice harvest. If a tea kettle leaks, a rocker comes off grandma's chair or a horse needs shoeing, "Vede" is immediately consulted.

Understand, storekeeping is this man's business, but you are probably wondering when and how he keeps store. He keeps the best-stocked store our town has yet known. His wife is a splendid clerk and business woman. He is the busiest man I know and yet is continually inventing jobs. His motto is, "I will not be idle," and in proving it is showing life-long residents a number of ways to make a living.

Muscle, Brain, Insight Won

Letter B

MANY years ago a young man came from Germany to America. He made his home in this neighborhood. We shall call him Mr. Walsh. He said he came in search of a wife. It happened a young girl came from the same country a year before. After some time they met and became husband and wife. A better mated team is hard to find.

They set up housekeeping in a farmhouse with meager furniture, as neither one had much capital. What they had they had earned as farm hands—which they remained for a year or more. They were intelligent, healthy and eager to learn.

They prospered as year after year sped by. Soon they owned a small farm, then rented a larger farm for a few years. They then purchased their present sixty-eight acre farm.

This farm is well stocked, buildings are kept in excellent repair and new ones added. A water system has been installed in the cow stable and the house and all buildings will soon be wired for electric lights. All is paid for and they have money besides. There is a family of eight children. Some have homes of their own.

The remarkable part about this is that these strangers in a strange land with muscle and brain for capital and a quick insight into what is valuable acquired all this wealth by tilling the soil.

The Man Not Talked About

Letter C

THE most interesting man is not always the one of whom we hear much loud and long praise. The real man is the one who is willing to efface himself for the sake of others. The farmers in my class (tenant farmers), do not often make fortunes, therefore, do not become famous. But because a man is not famous it does not follow that he is not a success.

The farmer I know most about started farming with less than $100. Yes, compelled to call the other man's house his home. What hopes and plans for the real home, all his own, in those first years! About the time the first indebtedness was paid the family had increased, meaning more expense. Each year he hoped to lay by something for that home. He always had something for the church; something, mostly in work without pay, for the ones who called on him for help. Once when hopes were most high, a valuable horse died. He said, "Well, I guess this will again postpone the purchase of our home."

As the years came and went a large family was reared, none of whom ever suffered from cold or hunger. All received some education, some college, some normal, and all high school training. Sometimes relatives needed help.

The home is yet only a dreamed-of thing. Soon this man will be past hard work. Will he not be ready to hear, "Well done thou good and faithful servant." "In as much as ye did it unto one of the least of these, my brethren, ye have done it unto me." Is not the most successful man the man who has treasures laid up in heaven, even tho he is not a popular man among the notables of this earth?

Tell Us Which Letter You Consider Best

THE judges have decided to ask Pennsylvania Farmer readers to choose the winner in the contest for the best letter about "The Most Interesting Farmer I Ever Knew." Please read the letters published on this and the following page and indicate in the coupon below the one you think should be awarded the cash prize. We shall be glad to have you suggest other subjects you would like to have discussed in Pennsylvania Farmer. This coupon should reach us on or before March 29th.

To the WEEKLY CONTEST EDITOR,
PENNSYLVANIA FARMER,
261 SOUTH 3RD STREET,
PHILADELPHIA.

I believe the prize for the best letter on "The Most Interesting Farmer I Ever Knew" should be awarded to the writer of Letter .

I would like to have the following subjects discussed in Pennsylvania Farmer:

Name..

Town.......................................R. F. D..............

State..

An Educated Specialist

Letter D

THE most interesting farmer I ever knew was a sort of specialist. While he grew enough of the general crops to suppply his family and feed his stock, he gave most of his attention to apples and small fruits.

He knew the history of all his fruits as far back as there was any written record. He knew their food requirements and what kind of soil and cultivation they required. He also knew the diseases and insects that afflicted them and how to combat them.

He was one of these who had an efficiency system of his own. He hardly ever got behind in his work. This was not only due to his doing things efficiently and at the right time, but also his good judgment in not attempting more than he could do thoroly and well.

He Read and Studied

His early education was limited to that of the district school, but since one's education consists of what he knows, I regard him as an educated man. He read at least a few minutes each evening even in the busy summer time and in the long winter evenings he not only read but studied. He took several journals pertaining to his work and magazines and papers besides.

He read books of travel and studied history. Macaulay's England, Gibbon's Rome, and Dickens were well thumbed, and a number of the better novels of the time were frequently added to his library. He had a wonderful wife of whom he took good care and who was always solicitous of his comfort. He had three fine sons and two equally fine daughters.

Every evening before retiring he read a few verses in the Bible. He used to say that he liked to read the Bible before going to bed. "It brushes the cobwebs from my brain and, besides, it works while you sleep."

A Life Full of Variety

Letter E

WOULD you know a real farmer if you saw one, say in a saloon? Farming isn't in the face. It isn't all in the hands or feet. It isn't in a straw hat or hayseed in the hair.

It is the real farming spirit which makes my most interesting friend. He says, "There is a big boom in real estate my way; all the farms from the city line have been sold to real estate men but two, my farm and the one next to me. I have a buyer for mine any day I say the word, either the whole or part. But I think I will wait until it reaches its full value before selling any part as I expect to keep the house, several acres of ground, also the creek and a nice woods to ramble around in, where the birds can come and build their nests in peace.

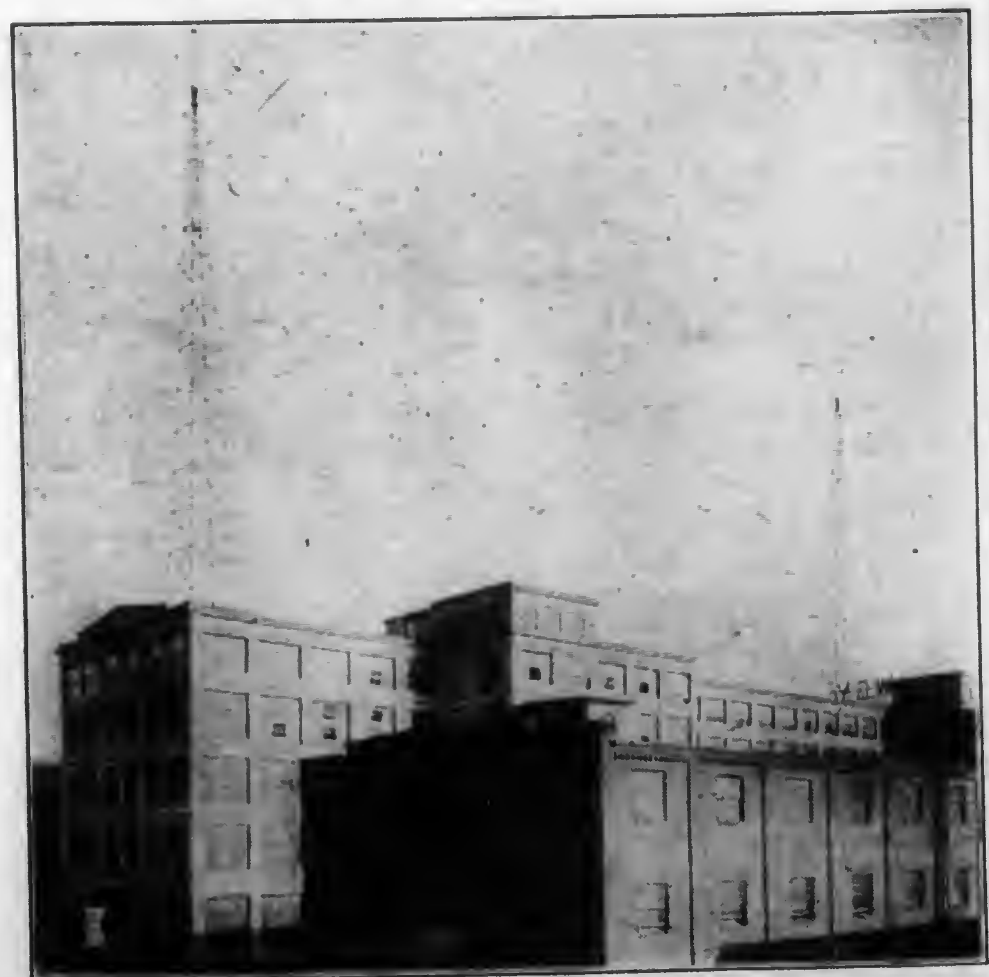
"I would like to have a few years of care free life, not the idea of loafing, but working in the garden or in other words on a miniature farm for the fun of it. I have been working hard since I was eight years old picking slate in the coal breaker at Wilkes-Barre, in which town I was born in '74. At the age of thirteen or fourteen I went with my folks to the Richland, New Jersey, colony. I helped my father clean up a ten-acre farm.

"At this place I learned to weave on a hand loom flannel and shawls. Then I went to Mays Landing and there I learned to weave on the power loom. Then I went to Philadelphia and learned to weave silk furniture covering, such as brocade. I went to Paterson with a man to make Jute rugs and later went back to Philadelphia to weave.

Next Bought a Saloon

"After being there sometime I got a desire to make money fast so I bought a saloon at Trenton. I stayed in it one year, sold out, went back to Philadelphia, got married, furnished a house on the proceeds of the saloon and went to weaving again in July, 1900. The following March I rented a farm at Seventy-first and Haverford Avenue, West Philadelphia. I worked the farm in summer and went into the mill to weave in winter. I stayed there two seasons then bought a farm which I worked most of the time until I moved here near Trenton. However, I worked every winter in the mill until I began to sell my produce direct to the people.'"

A Station You Often Have Heard



The power house and antennae of WGY, the famous broadcasting station at Schenectady, New York.

Help Wanted?

TO MAKE a profit, you must overcome not only handicaps of weather, weeds and pests, but also scarcity of help and high wages.

The bright spot in the picture is that *your power and labor costs, which are under your control, can be greatly reduced,* thereby giving you a profit year after year in spite of all handicaps.

With a 12-20, 18-32 or 25-45 h.p. Case tractor you can face all your field and belt work with a smile. You can plant, harvest and market your crops in good season every year *with a saving on every power job.*

Get the work and cost records of a few Case tractors and see why Case tractor owners prosper. No tractor is more efficient, more thrifty in operation and upkeep, better able to reduce your power and labor costs to the lowest point. Write for full information.

Established 1842

By power farming methods weeds can be eradicated, pests destroyed, the farmers can plant, harvest and market their crops at the best time, in spite of unfavorable weather.

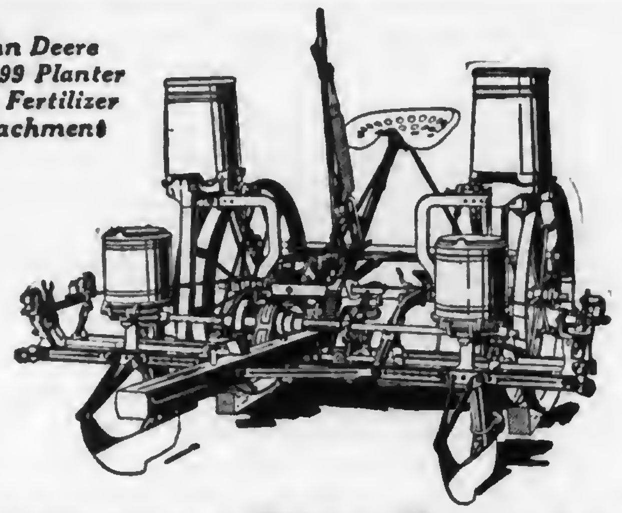
John Deere No. 999 Planter with Fertilizer Attachment



Accuracy Plus Economy

Consider these advantages which you get when you use a John Deere No. 999 Corn Planter with Fertilizer Attachment:

First—Unfailing planting accuracy which only the John Deere Natural Drop Seed Plate can give.

Second — Fertilizer is distributed at the same time the seed is planted; thus you save the time and labor of a second trip over the field.

Third—Your crops have a healthy start and mature early; giving you a better chance to beat the frost.

Fourth—You can distribute any kind of fertilizer in any quantity desired. The attachment can be put on and taken off without disturbing the seeding mechanism.

Briefly, you get absolute accuracy, you cut your labor costs and increase your profits.

Write for folder describing the 999. Learn about the variable drop that enables you to plant 2, 3 or 4 kernels per hill by shifting foot lever. Address John Deere, Moline, Ill., and ask for Folder OE-536

Doctor Lipman's Weekly Talk on Soil Fertility Problems

Distribution of Phosphates and Root Development

The chemist of the department of agriculture in a neighboring state has asked for certain information in the light of experience in other states. The answer to his questions are printed below for the benefit of readers who may be interested in the use of acid phosphate.

THE fixation of soluble phosphates takes place in soils rather rapidly. The rate of fixation is determined by the texture of the soil and its moisture content. In some soils the fixation not only takes place rapidly, but quite near the surface. If a soil is heavy enough, all of the available phosphates may be fixed within the upper two or three inches. Experiments carried on some years ago in Hawaiian soils very rich in iron showed that the fixation occurred quite near the surface. In general, the heavier the soil the less the depth to which the available phosphates will be distributed, and the lighter the soil the greater the depth to which the phosphates will be distributed before they become insoluble in water.

Not All Retained in Light Soils

In some of our own studies it has been found that in very light soils heavy applications of soluble phosphates may not all be retained and that the drainage waters from such land may actually contain considerable quantities of soluble phosphates. Even in this case, however, the applications will have to be heavy and the water supply abundant before soluble phosphates begin to be washed out of the soil.

Under ordinary conditions, soluble phosphates encourage a better root development if the phosphates are at all fairly well distributed. It is well known among successful wheat growers that an application of soluble phosphate for winter grain will permit the development of a better root system followed by greater resistance of the crop to winter-killing.

It should be remembered, however, that root development depends not alone on the supply of phosphates, but also on the supply of other plant food ingredients, particularly nitrogen. Hence, soluble nitrogen compounds, particularly nitrates, when used together with phosphates will encourage the deeper rooting of plants.

The nature of the crop will also influence the situation. For instance, in some of our experiments we find that uninoculated soy beans developed a better root system and the roots thus developed penetrated to a greater depth than did inoculated soy beans.

Explanation of Results

The explanation which might be offered to account for this is that, where there is good inoculation, the plants are enabled to obtain the nitrogen from the air and, with an adequate supply of phosphates and potash in the surface soil, deep rooting is not encouraged. On the other hand, where the plants are not inoculated and the nitrogen needs of the plant not supplied, root development will be encouraged because of the fact that the plants will draw on the subsoil as well as on the surface soil for their supply of nitrogen.

As already noted above, the depth to which soluble phosphates may distribute themselves will depend on the texture of the soil. It may range all the way from two to eight inches, or even farther, in the average soil. In the classical experiments at the Rothamsted Experimental Station, England, it was found that the soluble phosphates used in excess of the crop requirements thru a period of fifty years were found in the surface nine inches to the extent of eighty-five per cent and that nearly all of the rest was recovered in the second nine inches of soil.

I do not recall any experimental work on the effect that soluble phosphates may have on the distribution of the roots of fruit trees. It stands to reason that some such influence may be manifest, even tho in many of the experiments with fertilizers on fruit trees the effect of the treatment was but slight.

Didn't Increase Fruit Production

In the work done at the New Hampshire and New York (Geneva) Experiment Stations fertilizers did not to any marked extent increase fruit production. In experiments carried on at the New Jersey Station it was found that, where nitrate of soda was used at the rate of 200 to 300 pounds per acre in addition to bone meal and muriate of potash, the trees made very much larger growth. The nitrate encouraged twig and leaf growth particularly, but, after a number of years the total yield of the fruit was no larger from the trees that had received nitrate than from those to which no nitrogenous fertilizer was applied beyond the amount of nitrogen contained in the bone meal. In this connection, it may be noted that the land on which the trees were grown was quite productive.

As against this experience, much of the work done with apples, pears and peaches on gravelly and sandy soils in this and other states shows that nitrogen may be used profitably for increasing fruit production; that in some instances potash gives profitable returns with pears and apples, and that now and then positive results were also obtained with phosphoric acid.—J. G. Lipman

Field Drainage

I have two fields, about seven acres each, divided by a flat, shallow water-course depression, natural, of course, very much as the crease formed by opening a book about in the center. Now, on account of tractor work, I would like to throw these fields together into one long field and plow, cultivate, harvest, etc., right across this water-course. If I lay a round tile drain far enough up course to protect the upper edge of the field, all the way to the lower edge, how large tile and how deep a level will be necessary? Will plowing every other year loosen the top surface sufficiently to allow the water to settle to the tile and eventually dry the surface? The length of this drain should be about 200 feet. The soil of these fields is decidedly shaley. I will be especially grateful for whatever information you are able to secure in regard to my query.—J. L. V. D., Bucks County, Pa.

A satisfactory solution of your drainage problem will be contingent on the area of land to be drained. The situation confronting you might be handled most expeditiously by using a tile of sufficient size with a service ditch. The latter should be quite wide and shallow and only intended to take care of heavy rains. At such times a considerable rainfall must necessarily be provided for.

The proposed method would permit the use of an eight-inch main with a fall of one inch in 100 feet.

This should serve as an outlet for sixty acres. In the same way a twelve-inch main would provide for 140 acres and an eighteen-inch main for 300 acres. At the same ratio the drain may be made large enough to take the water from the entire water shed.

The service ditch referred to may be two feet deep and ten to twelve or fourteen feet wide, the banks sloping so that any machine may drive thru the ditch.—J. G. Lipman.

What Will Potatoes Do?

POTATOES have held the center of the stage the past season, but their act is not yet over. A little more than two months remains and then the curtain will fall for the 1925 potato crop. Last season many mock trials were held to see whether the potato should be banished, but none have been reported so far this season. The potato has again justified itself as a "good actor." There has been suspense, interest and a generally profitable time has been had by all concerned. The question now is: what will the next two months bring?

Influential Factors

The supply of old potatoes that dealers and growers still have on hand and the percentage of this supply that will be marketed are factors that will greatly influence prices. On January 1, 1926, the United States Department of Agriculture estimated that 60,707,000 bushels of old potatoes were on hand in the 19 surplus producing states, against 103,890,000 bushels on January 1, 1925. This compares with a six-year average of 92,757,000 bushels.

The supply on hand at the first of this year represented 26 per cent of the total crop produced in these states. Last year the supply on hand amounted to 34 per cent of the total crop.

The fact that 60,707,000 bushels of potatoes were on hand does not mean that that number of cars will be shipped, for seed requirements, shrinkage and other factors must be considered. The spring of 1920 was much like the present one. Holdings were practically the same and that year these states shipped 51 per cent of their holdings after January 1st. It is interesting to note that in May of that year the average price for potatoes was $7.13 per hundred pounds. This, however, does not mean that such a price will be reached this year, for altho holdings may be equal other conditions are different. The peak of the post-war prices prevailed then and the prices for potatoes earlier in the season were much lower than this season. Other conditions also enter in but many predict that the average for the entire crop may approximate that of the 1919 crop.

Holdings at First of Year

The holdings on January 1 were equivalent to approximately 101,080 cars of 600 bushels each. In other words if 50 per cent of these were shipped before the end of the season, it would mean 50,590 cars. Approximately 30,000 cars were shipped during January and February leaving 20,000 to come.

If there were 20,000 cars of old potatoes on hand on the first of March it would require only a normal carlot movement to clean them up. The high price levels are likely to draw out a larger percentage of stocks on hand than in a normal year. This situation, however, is aided by the stocks remaining in the 16 deficient producing states, that group which usually produces too few potatoes for their own use. These states were holding about 40 per cent less merchantable stock on the first of the year than the six-year average for those states shows. That is 6,420,000 bushels on January 1, 1926, as against 15,333,000 last year and a six-year- average of 11,550,000 bushels.—W. R. Whitacre.

COACH or COUPE

$825

BODIES BY FISHER

A Value That Only General Motors Could Achieve

Scoring an immediate and spectacular success, the new Pontiac Six is already one of the most discussed cars in America.

To introduce into the field of low-cost sixes, inducements to ownership other than price . . to overcome the limitations of ordinary performance, comfort, appearance and quality . . . there has been brought to bear on the development of this new Six, all of General Motors' engineering skill, manufacturing experience, production facilities and purchasing power.

At its price, the new Pontiac Six, with body by Fisher, is an achievement no less important than the first six-cylinder engine. This is true, simply because it introduces elements of beauty, size, stamina, comfort and performance, entirely without precedent.

You are invited to inspect the new Pontiac Six, now being displayed by Oakland-Pontiac dealers everywhere. Go prepared for a revelation . . . for only General Motors could produce such a car . . and price it so low!

Oakland Six, companion to Pontiac Six, $975 to $1295. All prices at factory

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N.Y., discovered a process of making a new kind of paint without the use of oil. He named it Powdrpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much. Write to A. L. Rice, Inc., Manufacturers, 114 North St., Adams, N. Y., and a trial package will be mailed to you free, also color card and full information showing you how you can save a good many dollars. RADIO DEPARTMENT

Conducted by

BRAINARD FOOTE

Radio Reception

Note: Last week we considered three of the six factors affecting radio reception: 1. Location; 2. Aerial; 3. Kind of Set. This week we shall consider the others: 4. Kind of Accessories; 5. Manner of Installation; 6. Skill of the Operator.

IN an automobile, the accessories are not absolutely essential to the use of the car, but what good would a radio set be without its tubes, storage battery and B batteries? Of these three items, the last two mentioned are not difficult to select, for one cannot go wrong with a well-known brand of either kind of battery. In the case of the tubes, it is a good plan to have them tested in a good set on a distant station that is already tuned in, where such a thing is possible. Of course, the set may require a slight re-tuning on account of different tube characteristics. At any rate, the buyer can keep an extra tube on hand to substitute for his old ones now and then to help him pick out the defectives.

Installation of Set

Installing the set so that the wires running from the aerial and ground may be quite short and direct is of considerable assistance. In particular the aerial wire ought to be short and at a distance from walls or other objects. The skill of the operator in adjusting the set plays an important role in reception unless the set is one of the latest one-control models where the various separate controls have been combined in one. A really good set of this kind is an expensive proposition but can be constructed with entire satisfaction.

Weather conditions play a varying part, too. In winter, particularly when it is cold, radio is at its best. Static is slight and waves travel the farthest. However, the increased use of super-power by certain of the best broadcasting stations is making summer radio for shorter distances a very reliable thing. The set need not be tuned with so much sensitivity and a smaller antenna, which collects less static impulses, serves just as well at that time.—B. F.

To Adjust Neutralizer

MOST all modern receiving sets that have radio frequency amplifier tubes have them connected in such a way that it is impossible for them to oscillate and send out interfering whistles to bother other listeners. Some sets use regenerative detectors so connected that the operator can find the station by means of the whistle without that whistle getting out on his aerial to interfere with others. The process by which this is done is termed neutralizing and the instruments employed are called neutralizing condensers.

Adjustment Not Difficult

To adjust the neutralizing condenser is not a difficult matter. First tune in a very strong station. Then take the first radio frequency amplifier tube out of its socket and wrap a bit of paper around one of the filament prongs, so that, when you put the tube back in its socket, it can't light up. The station will still be heard faintly. If your detector is regenerative, allow it to oscillate so that you can hear the whistle. Then vary the neutralizer very slowly till the signals disappear. The silent point will be very critical to find. You should use a non-metallic instrument to adjust the device, and keep your hand at least eight inches from any part of the wiring.

Lifting out the tube will then allow the signal to come in, since the balance is upset unless the tube is in. Remove the paper and put the tube back. If you have another radio frequency tube and neutralizer, repeat this with the second radio frequency tube, in just the same manner.—B. F.

Care of "B" Batteries

THE B batteries are the most expensive accessories you have. It is economical to purchase the largest size for sets using three or more tubes since the batteries last much longer in proportion to the original cost. B batteries are composed of a number of small cells like those used in flashlights, all connected together with soldered wires and packed in a box. Each cell delivers one and one-half volts, so that you can understand that a 45-volt B battery contains just thirty of these little cells.

Altho these are called dry batteries, they really are not dry, but filled with a moist paste. Should this become dried by long standing in a dealer's store or by excessive heat in one's home, the water evaporates from this paste and the cells are weak.—B. F.

From Here and There

LISTENERS all over the East report freak conditions for radio reception this winter, particularly in January and the early part of February. Scientists are at a loss to explain them, the aurora borealis and sun spots have been blamed particularly. In general reception North and South was better than East and West.

The broadcast audience is commending the efforts of WJZ's engineers to entertain them with music from England. This is received on a special receiving set located at Belfast, Maine, and put on the telegraph wires from there to New York and Bound Brook, New Jersey. The last test was partially successful, the dance music from 5XX, Chelmsford, coming thru strong at times, if not with particular clearness. At any rate, it's a thrill to hear those British accents from across the briny.

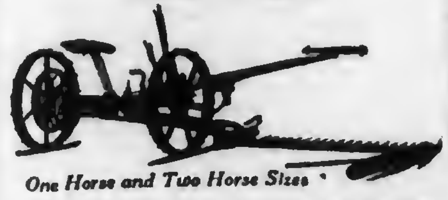
Certain Congressmen are becoming alarmed at the extension of the chain broadcasting, which brings good programs to all parts of the country. One claims that he is tired of getting the "same stuff" from so many stations. But most listeners won't agree with him. We'll wager chain broadcasting was acclaimed by listeners in Kansas City who heard their protegee, Miss Marion Talley, "air" her remarkable voice via WDAF and other stations recently.—B. F.

Receives Less Static

Is it true that a loop antenna receives less static than another aerial? Will a loop work on a five-tube neutrodyne?—M. N. B.

Yes, the loop receives less static in proportion to the signals than a regular aerial. The aerial outdoors receives static in all directions, whereas the loop receives static best in only two directions. A loop may be used on a neutrodyne for moderate distances, but for reception over 100 or 200 miles it will be much inferior to the outside aerial.—B. F.

Frost & Wood MOWER



One Horse and Two Horse Sizes

Popular throughout the world for many years. Thousands of satisfied users. Built for heavy crops and rough and hilly land. Roller bearings assure light draft. Its cutter bar strength and superior cutting mechanism give long service.
The Internal Drive Gear is always ready for work in heavy or light crops. Quicker response at knife bar, less wear on gears and fewer repairs. The knives keep on cutting when bar is raised to clear obstructions, saving time and crop. Sizes 3½, 4, 5, 6 and 7 feet.

Beekeeping

THE ten-framed hive, containing self-spacing frames, might well be called the standard bee hive of América. It is the hive most commonly used all over the country and is the best for all Pennsylvania conditions. Two types of self-spacing frames are in common use, the wood spacing and the metal spaced frame. As far as results are concerned it matters little which type is used.

The hive cover should be of the shallow telescope type with inner cover and metal cap. If the beekeeper buys his hives from the manufacturer proper bee spaces will be found but if he makes his own hives he must be very careful to provide bee spaces or trouble will ensue with excessive propolizing, if the spaces are too small, and building of burr combs in the spaces if they are too large. Unless one is an accurate workman and has plenty of spare time it pays best to buy all equipment ready-made.

Hive and Super Equipment

All hive and super equipment is cheapest if bought in the flat and nailed up and painted by the beekeeper. However, in order to avoid mistakes by nailing some parts wrong and having everlasting trouble afterwards, it is advisable to order the first hive and supers all ready set up ready for the bees, to be used for a model.

A good smoker, one of the larger sizes, a bee veil and a hive tool to ply off the cover and to loosen the frames are necessary tools. More rapid work can be done without gloves altho without gloves an occasional sting will be received on the hands. The kinds of supers and other equipment to be used depends upon the kind of honey to be produced and this in turn depends on the preference of the beekeeper and the demands of his market for comb or extracted honey. There is no doubt but that the very best beekeeping practice is to produce both comb and extracted honey in the same apiary.

At least, in the average season, the beekeeper who specializes in comb honey production can reduce swarming, keep his colonies stronger and produce more honey by the judicious use of the honey extractor than is possible without it.

For Comb Honey Production

For comb honey production at least three comb honey supers, filled with sections having in them full sheets of thin super foundation, should be on hand and ready for the bees ahead of the expected honey flow. The supers, a few extra hives for swarms, tools for working, a small extracting outfit, and proper storage room for the crop until sold comprise the comb honey producing outfit.

Three styles of sections are in common use—4¼x4¼x1 7-8 in. beeway or slotted—4x5x1½ in. and 4¼x4¼x1½ plain. It matters little which style section is used. However, it is a nuisance to have more than one kind of equipment in the apiary and since each style of section requires a different kind of super equipment it is best to adopt one style and stick to it.

For extracted, or more properly, liquid honey production not less than two full depth hive bodies or three shallow extracting supers, with frames wired and filled with full sheets of medium brood foundation should be provided for each colony, for surplus honey. Other equipment includes a good extractor, uncapping can, a settling tank, uncapping knife or uncapping machine, containers for wholesale or retail market and of course a good roomy workshop.—Geo. H. Rea.

The Corner Post

A fence is as strong as its corner post.

The farm has its "posts" which give it support. Animal power—human power—motor power.

Motor power, electricity, can keep the farm going when the other posts fail. When help is short, when time must be saved, when things go wrong—electricity is *there* to do its job.

It is the corner post of a dozen operations on any electrified farm.

The G-E monogram will be found on many of the products required to do the jobs which "keep the farm going"—lighting, milking, churning, washing, feed grinding—others.

In sections where farms are electrified you will also find the G-E Farm Book used as a guide. Ask your electric power company for a copy or write us at Schenectady, New York.

Eastern States Farmers' Exchange

A Successful Cooperative

The Eastern States Farmers' Exchange was organized in 1917 to enable farmers to buy cooperatively to better advantage than they could buy individually. The Exchange has recognized fundamental economic laws from the first, and has met them with sound and proven business methods.

In the first place, it recognized the fact that economical service could be established only on commodities which groups of farmers require in quantity. Feed and grain naturally became its main project.

In the second place, it quickly saw that cooperative buying offered farmers the chance to select the quality of their ingredients and to blend their rations from the feeder'. point of view. Eastern States feeds are blended to produce economical results and not to sell attractively in a highly competitive feed market in which price is the first consideration and quality is the second. Today the Exchange owns a mill with a capacity for 200,000 tons of feed and grain a year, located at Buffalo, N. Y., equipped with a complete laboratory, and dedicated to giving to Eastern States members quality feeds at the lowest possible cost.

In the third place, the farmer directors saw that a cooperative to be successful must be managed by big caliber business men. They have selected their managers from the class of men who couple business ability with cooperative ideals and they have made it possible for their Exchange to reach a volume of business in 1925 of $5,979,965, and to handle it at the extremely low cost of 2.88% of gross sales. This business was done with 16,000 members in New England and Delaware.

Not one dollar has been invested by farmers in capital stock of the Eastern States Farmers' Exchange for it is of the non-stock type, each patron being an owner and sharing equally with his fellow patrons in the management of the Exchange. Out of earnings it has built up a surplus fund amounting January 1, 1926, to $115,449, and out of 1925 earnings, patronage dividends amounting to $30,898 were distributed to 1925 patrons.

The Eastern States Farmers' Exchange has been serving farmers in New England and Delaware and at the request of farmers of Pennsylvania and eastern Maryland is now making its service available to farmers in these states. For information on its organization and its feed service, fill out the accompanying coupon and mail it to the office.

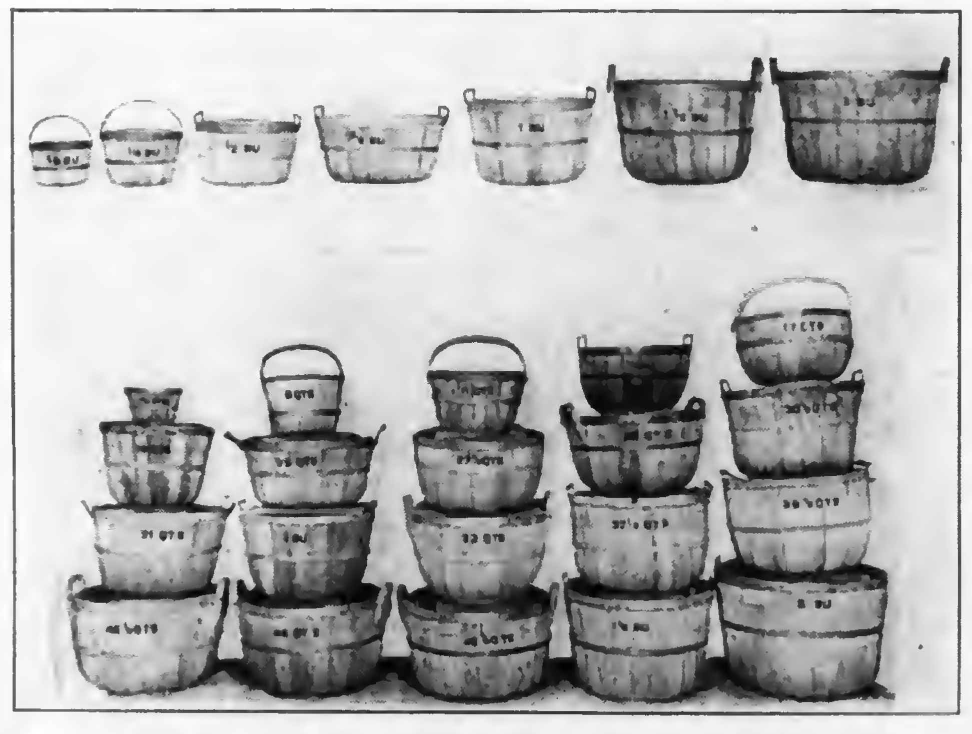
Standard Containers Proposed

Congress Studies Bill to Make Odd Sizes Unlawful

THE familiar five-eighth bushel hamper, used extensively by New Jersey farmers who ship to Philadelphia, and other odd-sized baskets favored in other sections, will soon disappear if a bill now before Congress is made a law.

House of Representatives Bill 5677, on which hearing will be held in Washington within the next few days, provides for the establishment of a few standard sizes of hampers, round stave and splint baskets. The object of the measure is to eliminate the confusion and deception resulting from the use of an almost endless assortment of container sizes used in the fruit and vegetable trade.

The advantages of uniformity in container sizes are so great that little opposition to the bill is expected. As the new law deals only with the capacity, and not with the shape of the container, one of the principal objects to the elimination of the odd sizes is removed; the basket makers can easily make containers of standard capacity that will fit the wagon and truck bodies that were built to fit certain odd sizes. This applies particularly to the five-eighth hamper, which will be supplanted by the half bushel size.



Above: Standard sizes of round stave baskets proposed by bill now before Congress. Below: Confusing and deceptive sizes in common use.

Will End Re-packing

This change will afford an added advantage to the New Jersey growers who have been shipping to Philadelphia in five-eighth hampers; it will eliminate the re-packing of fruit into half bushel hampers for re-shipping by the Philadelphia receivers. Buyers in other cities do not want five-eighth bushel hampers. For that reason the Philadelphia buyers of Jersey produce have had to transfer it to half bushel hampers before re-shipping it at considerable loss of time and quality of the fruit and vegetables.

If this bill is passed at this session of Congress, growers will have two full seasons in which to change to the standard sizes, which allows plenty of time in which to use and dispose of odd-sized baskets now on hand. It will not take effect until November 1, 1927.

There are now at least seventy-five sizes of hampers in use, most of them confusing to both buyer and seller. The bill now before Congress reduces the number to seven standard sizes. Seven standard sizes of round stave baskets also are established to replace a great number of odd sizes. Six standard sizes of splint market baskets will take the place of twenty-five or more sizes now in use.

The bill provides that standard hampers and round stave baskets for fruits and vegetables shall be of the following capacities: one-eighth, one-fourth, one-half, three-fourths, one, one and one-half, and two bushels. A bushel, standard dry measure, has a capacity of 2150.42 cubic inches. The standard sizes for splint baskets are four, eight, twelve, sixteen, twenty-four, and thirty-two quarts. A quart, standard dry measure, has a capacity of 67.2 cubic inches.—C. L. W.

Three-in-one Crop

REFERRING to an article on oats, pea and barley hay recently published in Pennsylvania Farmer a subscriber asks further information on how to sow and harvest the crop.

Experiments have shown that Canada field peas and oats sown together will produce a larger yield than a combination of oats, peas and barley; also, that the two make a better combination in other respects. They should be gotten into the ground as early as the soil is fit to work. Plow and harrow the ground, then drill about one and one-half bushels of Canada field peas to the acre. Set the drill so as to put the peas three or four inches deep. If the drill is not equipped with springs to force the hoes deep, twine a log chain about them to add weight. Then drill one and one-half bushels of oats crosswise of the field, or sow them by hand and harrow as usual. Do not add extra pressure to the drill in drilling the oats.

The crop should be cut for hay when the oats are in the early dough stage, which will be just when they begin to show a yellowish tinge. Use about the same methods in curing as in making clover hay. While the crop may be allowed to ripen and be threshed as other grains and either ground together or separated, the average feeder will get more value from it by making it into hay than in any other way.—K.

Mushroom Diseases

MUSHROOM diseases are being studied by W. S. Beach, research specialist in plant pathology at the Bustleton field laboratory near Philadelphia, and L. O. Overholts, associate professor of botany at State College. Little work has been done on mushroom diseases and the project has been started to determine their cause and cure.—A. L. B.

Turn It Into Milk!

With "Special Dairy"

Low big-crop prices for corn and other homegrown grains, with good prices for milk, make conditions just right for the owner of milch cows. Don't sell feed at low prices when you can get more for your crops by turning them into milk.

This year it will pay everyone to turn corn, oats, and forage into milk. Milk contains protein, sugar, fat, mineral and water. The dairy ration must contain all these ingredients in correct proportion to get milk in paying quantities. Home grown grains are excellent as part of the ration. But fed alone, unbalanced, are a costly mistake. Unbalanced rations are wasteful. They do not contain all the milk elements.

INTERNATIONAL Special Dairy Feed

is a sweet, tasty, appetizing feed that rounds out the ration so that the cow is supplied with every element she needs to make milk. Thousands get more milk—quarts in place of pints—profits instead of losses—by using Special Dairy.

Special Dairy makes cows turn feed into milk faster. Big volume milk is low-cost milk. Special Dairy contains rich cane molasses that tempts the appetite—cows eat more, drink more water, digest better, give more milk—milk that costs you less per quart.

Special Dairy Guarantee

Your interests are protected in using Special Dairy by our unconditional, million-dollar guarantee that every 100-lb. sack fed will increase the milk yield at least "20 Extra Quarts" over any unbalanced ration. Less milk production brings prompt remittance of difference in cash.

Thousands are getting extra milk profits with Special Dairy. You can get them too. Order a trial ton from your local dealer today and insist on the sack with the red sawtooth border or write for name of nearest dealer. It will pay you well.

International Sugar Feed Co.
Minneapolis, Minn.

20 Extra Quarts From Every Sack -GUARANTEED!

Free Trial of Proved Swedish Abortion Treatment

Famous Foreign Formula quickly relieves badly infested herds. Gives amazing results in cases believed hopeless.

Thousands of American Farmers say the Froberg Swedish Abortion Treatment has saved their herds from destruction. This remarkable treatment has been used for years in the big dairy country Sweden, and has cleaned up whole districts over there literally rolling with abortion. Frank Halfman, Crown Point, Ind., writes: "Two years ago, I lost every calf from my herd of forty cows. All remedies failed until I used yours. I have never lost a calf since."

C. C. C. (Cow, Calf, Control) is guaranteed to absolutely stop abortion or the treatment cost is refunded. Write today for full details explaining our free trial offer.

Simply send your name and address without further obligation on your part to Froberg Remedy Co., 16 Lincoln St., Valparaiso, Ind.

Busy Days in Jersey Legislature

Many Bills Affecting Farmers Passed and Pending

THESE are busy days in the New Jersey State Legislature. Both the Senate and the House are jammed with bills and behind time as usual. Substantial progress has been made, however, on some phases of the agricultural program. A number of other matters not strictly a part of the farm legislative program are being closely watched by the farm organizations.

The so-called Fruit Tree Bill which would give legal protection to the purchaser buying fruit trees guaranteed to be true to name, passed the Senate in late February and made rapid progress thru the Assembly in early March. This bill is the outgrowth of the work of the State Fruit Tree Committee during the last year. It provides registration of sale with the State Department of Agriculture, when a grower buys trees guaranteed to be of the variety represented. Loss from trees which do not prove up is covered by a bond or insurance policy. The farm organizations expect the measure to become a law.

Trespass Bill Introduced

A trespass bill introduced this year would protect owners of cultivated land against wilful trespass. This bill is practically a duplicate of a measure introduced last year and lost in committee. It embodies the principle, now well established, that a farmer has the rights to his own property and operation of such a law, it is maintained, will not infringe upon the rights of well disposed people. The organized sportsmen have always maintained stiff opposition to this trespass measure and apparently there is no substantial change in the set-up of the present Legislature.

Last fall, one of the southern counties requested at the legislative conference of all farm groups that amendment be made to the truancy laws so that local recorders might try truancy cases. The Joint Legislative Committee drew and presented a bill along this line which has passed the Assembly and gone to the Senate early this month. The measure, which holds excellent chance of being finally passed and signed, would eliminate the necessity of carrying truancy cases to the county seat.

Perhaps the Gas Tax Bill now pending has created more widespread interest among farmers than any other one measure in the Legislature. The bill calls for a tax on gasoline in lieu of a part of the license fees and exempts gas used in trucks and stationary engines. Very strong opposition has been advanced by commercial automobile and motor truck interests, and hearings on the subject leave some doubt as to the ultimate disposal of the bill. With minor exceptions, the farm groups are supporting the bill.

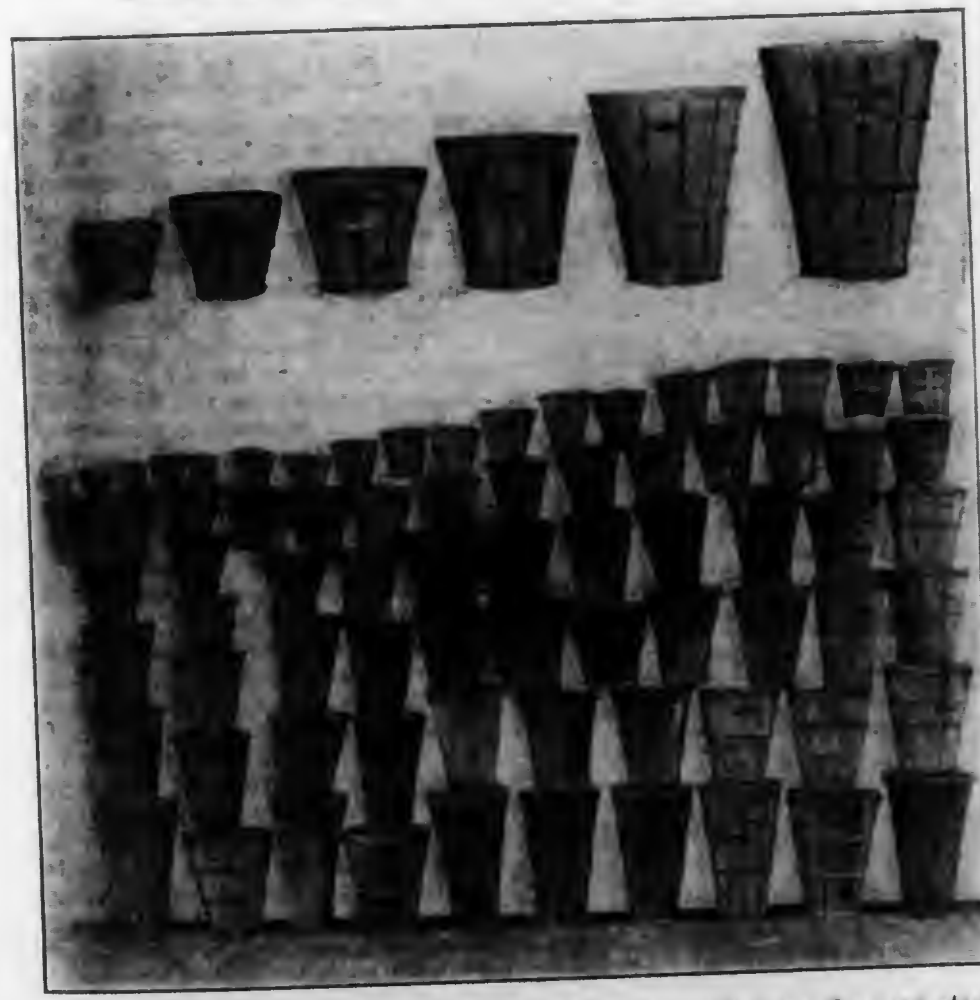
Oppose Automobile Insurance Bill

Strong opposition from commercial sources has also been manifested against the compulsory Automobile Liability Insurance Bill, now pending. This measure would compel every operator to take out liability insurance of $5000 and $10,000 respectively for one or more persons, or otherwise to show financial responsibility. The operator would be called upon to satisfy the law in this regard before the state would issue an operator's license.

The Annual Appropriations Bill to date carries generous financial support for the various state institutions, such as the Experiment Station, State Department of Agriculture, etc. The beekeepers have had presented a bill to the effect that foul brood might be controlled by declaring it a public nuisance.

Various measures that are of interest to livestock producers have also been presented. One would provide ways and means to control the spread of livestock diseases by more effective and vigorous inspection. The measure has been well supported in the Legislature. Still another bill, if passed, would allow counties to make a direct appropriation to indemnify owners of sheep killed by dogs, whereas at present the only funds available to pay such damage are those received from the dog licenses.—B.

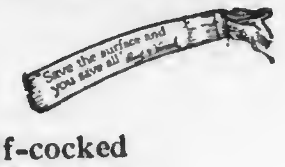
Standard Sizes to Eliminate Confusion



Above: These are the standard sized hampers provided by the new standard container bill. The two-bushel size is not shown. Below: The seventy-five different sizes now in use.

YOUR FELTON-SIBLEY DEALER WILL GIVE YOU PAINT FACTS

see him first!



Save the surface and you save all

For goodness' sake don't go off half-cocked on this paint proposition. The investment in time alone on any painting job is big enough to warrant checking up on the paint that's going to be used.

Felton-Sibley Ready Mixed Paints have stood for quality for more than half a century. And Felton-Sibley dealers are selected because they appreciate quality and know their business.

See your Felton-Sibley dealer first—get the facts—then go ahead and you'll have no regrets.

PAPEC

"The Cutter That Does Not Clog"

"THE Cutter never clogged and we had no trouble with it whatsoever," writes P. C. Petersen, Johnston, R. I., after two years' use of a Papec Cutter. The Feeding mechanism has been so perfected that a man is no longer needed at the feeding table, saving the wages of one man, and doing a better job.

Needs Less Power—Lasts Longer

Any good two-plow tractor will run an N-13 or L-16 Papec Cutter to capacity without danger of clogging. Where there is no tractor, the R-10 Papec can be used with any farm gasoline engine developing 3 h.p. or more. The Papec lasts a great many years with very little upkeep cost. J. B. Johnson, Southboro, Mass., bought his Papec Cutter in 1917, cut from 25 to 30 acres of corn every year, also lots of hay and straw for bedding and after eight years writes: "To date have not spent one cent for repairs."

Write for FREE Catalog

It shows why the Papec has won the praise of men who know machinery. It demonstrates that a Papec will pay for itself in one or two seasons under favorable conditions.

41 per cent cottonseed meal..	38.50@39.25
43 per cent cottonseed meal..	40.50@41.25
34 per cent linseed meal.....	48.75@49.20

Millfeed firm and advancing under light production and improved demand.

For Baltimore, Cumberland and Williamsport rate points, subtract 20c per ton (for cottonseed meal 40c per ton); for New York, Newark rate points, add 40c per ton (for cottonseed meal 60c per ton); for Woodbury, Bridgeton rate points, add $1.00 per ton; for Freehold, Toms River, Cape May rate points, add $1.40 per ton.

Philadelphia Markets

THE Philadelphia potato market has shown considerable improvement during the week ending March 13, according to the Pennsylvania and Federal Bureau of Markets. This was due largely to the general strengthening of the shipping point and consuming markets all over the country. Pennsylvania round whites opened at $6.50 to $6.60 per 150-pound sack in Philadelphia and closed at $6.75. Maine Green Mountains opened at $6.75 to $6.75 to $7.

The strawberry market was more active during the early part of the week but weakened toward the close Onions were in light supply and the demand was only fair. Cauliflower was slightly weaker. Pennsylvania mushrooms closed firm, while parsnips and carrots were steady. Apples were very dull and draggy thruout the week.—W. R. W.

Butter Markets

WHILE the butter markets for the week ending March 13 opened with prices at all four markets advancing a half cent, the firmness was only temporary. Buyers were not inclined to follow the advance and were again operating on a hand-to-mouth policy which by the middle of the week caused some accumulation of stocks on dealers' floors, especially in the finer grades.

Receivers viewed any accumulations with concern and adopted a free selling policy even to the point of offering concessions which caused declines on Thursday at all markets with the exception of Boston where supplies of finer grades were finding a fairly ready sale.

The nervous and fluctuating markets which have prevailed the past few weeks have so unsettled the minds of the operators that very few are willing to venture opinions regarding the future trend of the market. The market at the moment is so sensitive and uncertain that operators for the most part are continuing a free selling policy in order to guard against carrying any excessive stocks on possible decline and buyers for the same reason are limiting their purchases to their most urgent needs. These policies result in a further aggravation of the very sensitive position of the markets.

County News and Comment

Armstrong County, Pa.—Very unfavorable weather conditions for all fall planted crops as well as for doing many kinds of farm work has prevailed during March. Bare ground with almost zero temperature at night and mid-day and afternoon thaws disastrous to wheat and rye as well as alfalfa and the clovers, all of which went into winter quarters small in size and puny in vigor. Ordinarily much plowing is done in this locality at this date, whereas, not a furrow has been turned yet. Feeding period having begun in October indications now are that all roughage will be cleaned up by May 10. Most farmers complain that home-grown corn will not last beyond that date. There has been much disappointment over the heavy percentage of loss on early littered pigs because of severity of weather. Losses in some instances have reached seventy-five per cent. The very good demand for hog products and beef has cleaned out most feeding lots. Egg production has been diminished by severity of weather and yet prices are low, 30@40c doz. Much milk is sold and butter-making, except for home use, is away below that of recent years. Certified seed potatoes are interesting a large number of growers. Seed from Michigan is costing in carlots about $3.75 plus freight. That from northern and southern tier Pennsylvania counties about one-half dollar per bushel less. No spraying yet done. No dirt roads have fully broken up yet. No demand for horses of a significant character, altho even "tractor farmers" still keep one or two teams. No colts raised. Very severe season for sheep man. Much drilling for natural gas going on and many good wells coming in. Coal mines are operating full time on 1917 scale. Hay and straw in good demand at $20@25 and $12@14 ton, respectively. Wheat, $1.60@1.80; corn, 50c, in ear; oats, 50@55c; rye, $1.10; potatoes from farm, $2.50@2.75; chickens, 28@32c. No cloverseed sown yet. No spring sales posted. Pruning all done and much fence repair work under way.—W. M. P., March 10.

Bradford County, Pa.—Weather is letting up in severity slowly but thermometer still goes to zero occasionally. Rivers have risen but not enough to cause any damage. Main roads are open for autos and sleighing is poor. By-roads are still full of snow. It has been useless to open them as they soon drift full again. Men working in woods only when absolutely necessary on account of deep snow. Many farm and poultry meetings being held thruout the county under the auspices of the county farm bureau. Potatoes selling for $2.30 and up; buckwheat, $1.60 cwt.; eggs, 28c; butter, 45@55c.—G. E. E., March 3.

Clarion County, Pa. — March zero weather and snow storms make it very unpleasant for farmers to do spring work. Manure hauling and chores is work of day. Many people sending their hogs and beef cattle to market before spring work begins. Farm sales on the go this spring. Young pigs are going to be scarce on account of so many brood sows losing their whole litters. Cow buyers plentiful and fresh cows scarce. Rural schools progressing nicely this winter. County agent trying to make a drive on the corn borer this spring. Market prices: wheat, $1.70; oats, 45c; corn, ear, 40@50c; hay, $8@10; butter, creamery, 50c; eggs, 25c; veal, 13c; hogs, $15, dressed.—C. R., March 9.

Frederick County, Md.—March came in like a lamb but has been acting like a lion ever since. Grain looking fine so far. Has not been hurt as yet by freezing weather. Grass very poor in most sections. Practically all clover killed by long drought last summer. Quite a few farmers will plow up fields intended for hay and leave old sods for hay this year. Eggs extremely low, 26c on local markets. Butter is good, 40@50c; fat hogs are still high, around $16 cwt.; beef cattle steady, 8@10c, local. Hay scarce and fair prices being offered, especially by sheep growers, for clover hay. Farm sales just begun. Fewer this year than for several years.—R. J. W., March 8.

Indiana County, Pa.—March so far changeable. Enough snow came after last thaw to cover grain which as yet looks well. Farmers in county are looking forward to a good season. A good deal of plowing already done and fertilizer and lime are being strongly ordered. A good many people are looking for horses and mules. Wheat took a drop in price lately, now $1.60 in Indiana. Prices: corn, $1; oats, 50c; buckwheat, $1.60; pigs, 14c; fat hogs, 13c; butter, 50c; eggs, 30c; milk, $2.50 per cwt. Fence Day, observed lately in Indiana, was very well attended. There were many displays of fences and many speeches made. Most speakers emphasized the good corner posts and No. 9 wire thruout. They spoke on anything from stump fences to the modern wire fence with steel posts. The new electric law for rural electrification does not prove very popular here because of the high rates placed by electric companies.—H. A. N., March 8.

Juniata County, Pa.—Very cold, rough weather thru February. Only seven of twenty-eight days were clear. Twenty-four inches of snow fell during month. Grain fields are not looking very good at present time due to intermittent freezing and thawing. More interest being taken every year in purebred stock and poultry. Chick hatcheries are in operation and many chicks being shipped each week. Good seed potatoes scarce. County Agent D. R. Pheasant has made arrangements to get a carload of Michigan potatoes shipped in. Price $3.80 off the car. Table stock sell around $2@2.25, some holding for a still higher price. Good clean cloverseed also scarce and high. Wheat has dropped, selling around $1.60 on local markets; corn, 80c; oats, 50c; hay, $18; butter, 45c; eggs, 25c.—C. B., L., March 6.

Lebanon County, Pa.—Snow which covered fields during February has nearly all disappeared. March started in like a lamb, but didn't last long. Farm stock and implement sales are at their height now and good prices are realized. There are still some farms without tenants. An effort is being made to have tuberculin test on the area plan established for North Lebanon Township. A quantity of seed corn is being distributed this spring to the farmers, by the banks of Lebanon County, in cooperation with the Agricultural Committee of the Lebanon Chamber of Commerce, and the Lebanon County Agricultural Extension Association. Varieties are of the Golden Queen, Sure Crop and Bucher's Yellow Dent, allowing one-half bushel to each farmer applying. The Lebanon County Cooperative Association, thru its secretary treasurer, A. E. Reist is taking orders for seed potatoes of Michigan Russets and Cobbler varieties. Prices: wheat, $1.70; corn, 80c; hay, $18; straw, $11; milk, $2.20 cwt; butter, 55c; eggs, 30c.—P. L. M., March 3.

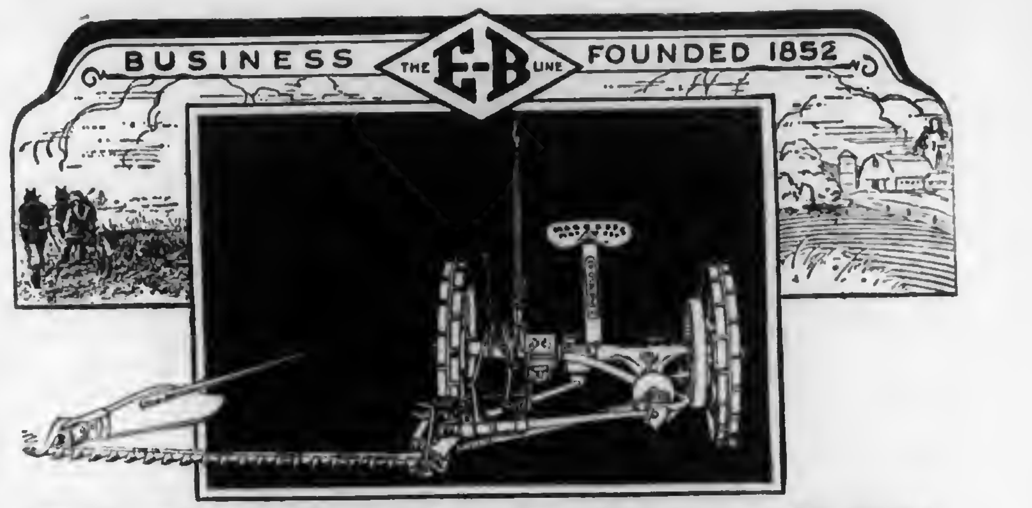
Montgomery County, Pa.—Snow practically all gone leaving fields bare. Some farmers are taking advantage of weather to move manure but it will be hard on the crops. Many farmers were kept busy supplying wood to town folks, providing a source of income not usually worked in this section. End of the coal strike caught many dealers with soft coal and coke on their hands. Industrial situation in towns not very bright but the revival of building operations will increase prosperity. Quite a few public sales. Farms are not selling very fast and not as high as they have been. Many places are open to renters. Prospects of $2.00 wheat are pretty slim, present price $1.80. Other prices: corn, 90c; potatoes, $3; calves, 13c; chickens, 30c; eggs, 40c; butter, 60c. The baby chick business will soon be in full swing, most poultrymen have quit using small incubators and are buying direct from big hatcheries.—C. N. D., March 4.

Passaic County, N. J.—The coldest weather for the year came along in February and is still with us. Two heavy snowstorms in February and the ground was covered with about three inches of ice which is about off now. I do not think strawberries suffered any but it may have hurt spinach. Roads are fair to good, some of the oiled macadam are showing signs of wear with quite a few holes in them. Early tomato and pepper plants are up in flats and will soon need transplanting. The price of eggs is a little lower than last month with the egg production increasing.—N. D., March 8.

Potter County, Pa.—Night of March 5 was coldest night of winter. Ground is still white with snow. Farmers having sugar bushes to work are waiting for sap to start running. Farmers' Week meetings were held in the vocational room of the Coudersport High School last week. Mr. Earl Moffit, extension lecturer on farm management; Mr. E. L. Nixon, potato expert; Mr. J. R. Haswell, extension engineer of State College, and Miss Cecile Gebhart, home economics extension worker were speakers. Many farmers buying hay. Prices ranging from $12 for loose hay in barn to $17 for baled hay. Prices vary according to quality and location. Dairymen are adding more cows to their herds. The bi-weekly shipment of veal calves began the last of February. A few more carloads of potatoes were shipped recently. The first price offered was $2 per bushel but later the price dropped. Local prices: eggs, 30@35c; butter, 45c.—M. C. S., March 8.

Tioga County, Pa.—Thus far we've had typical March weather. There has been a long run of good sleighing and farmers have made the best of it by getting long distance hauling done and stocking up with coal and feed against the inevitable break-up which must come soon. Farmers with sugar bushes are overhauling equipment, cutting wood and preparing for business. Those who did not get ice early have had an opportunity in the last month to stock up. The changeable weather has been hard on poultry but well-cared-for flocks are producing fairly well. Much sickness continues Many schools have been closed thruout county this winter because of epidemics of scarlet fever. Prices: eggs, 26c; veals, 13c; potatoes, $2; good milk cows from $100 to $125.—P. W. L., March 8.

Said President Coolidge in his proclamation designating April 18-24 as the 1926 American Forest Week: "If we are to flourish, as a people and as individuals, we must neither wastefully hoard nor wastefully exploit, but skilfully employ and renew the resources that nature has entrusted to us."



E-B Hay Tools are Dependable

When the busy haying season comes you can't afford to take a chance on worn or out-of-date equipment. You can depend on E-B Hay Tools to put up your hay with the minimum of time and labor.

Whatever you need in hay tools—mower, dump rake, side delivery rake or loader—you will find it in the E-B Line, and guaranteed to give you years of satisfactory service.

E-B Osborne Mower—a simple internal gear drive. One piece frame; low crank head reduces wear on knives and cutting parts; flexible cutter bar, adjustable and replaceable wearing parts.

E-B Osborne Dump Rake—all wearing parts are reversible and interchangeable thereby giving quadruple wear; teeth well curved, so they lift and carry hay instead of dragging it.

E-B Side Delivery Rake—can be operated as a rake or tedder, changed by simply shifting a lever. Does not shatter leaves. Ideal for clover, alfalfa, beans.

E-B Hay Loaders—two types. The *Gearless* or *Rake bar Loader* is a one-man machine without slats, ropes or chains. Long slow sweep. The Drop Deck *Cylinder Loader* rakes clean from light or heavy windrows. A very practical loader. Mail coupon for full information on why the E-B Hay Tools are better.

TELL the advertiser you saw adv. in Pennsylvania Farmer.

Prices and Prospects

NEARBY white eggs moved slowly on the New York market during the week ending March 9 and prices were lower. Toward the close of the week the demand was active for desirable qualities. Mixed colors and the cheaper grades, which retailers could use in meeting the competition of the low prices prevailing in the chain stores, met a prompt outlet.

The Philadelphia egg market has been about steady, altho a decline occurred during the latter part of the week. Receipts of eggs totaled 32,[illegible]15 cases, of which number Pennsylvania supplied 2069.

Receipts of live poultry in New York were comparatively light during the latter part of the week. The market was firm with a good demand for fowl. The average run of chickens was staggy and sold slowly, while the smaller smooth-legged types moved readily. There was a good demand for old roosters and ducks. Farmers will find a good outlet for fat fowl, ducks and geese for the Jewish Passover that comes on March 30-31st.

Wheat Prices Decline

Wheat prices continued to drop during the first week of March, on account of the weakness in foreign markets. The demand for soft red winter showed considerable improvement because of the light supply and the lighter offerings of western white wheat. Light receipts of corn, together with a fairly active demand held the cash market relatively firm, altho future prices declined slightly. Conditions in the oats market were much the same as corn. Future prices were lower but the demand for cash grain was active. The rye market did not follow the full decline of wheat and displayed independent strength.

Prices of top grades of hay averaged higher during the week, but the bulk offerings consisted of ordinary and poor hay which was barely steady. Moderate receipts strengthened the hay market at interior points but the northeastern and Pacific Coast markets were dull. Timothy was steady with top grades firm. Receipts at Boston were liberal but prices on the best grades were unchanged. The New York market was dull with liberal arrivals but the demand improved toward the close of the week and prices were mostly unchanged. Light offerings forced prices higher in Pittsburgh but the market at Cincinnati was dull.

Wool Market Quiet

The Boston wool market was quiet during the week ending March 9 and prices on domestic stock, including eastern fleece wools, were largely nominal. Some sales have been made at a little lower figure of late. Ohio Delaines have sold about on the basis of 49c to 50c in the grease.

The eastern potato markets were fairly steady during the week ending March 10th. Prices have shown little change. The shipping point markets have shown a firmer feeling and quotations have advanced. During the first week of March shipments from Maine increased fifty per cent to 1230 cars. The total shipments from the late potato states amounted to 3850 cars during the week, or about one-fourth less than last season's corresponding movement. The total shipments of old potatoes up to March 9 were 179,540 cars compared with 203,805 to the same date last year. Only six of new potatoes have been moved as against 53 cars in 1925.—W. R. W.

"Has your brother been bothered long with acute indigestion?"

"Oh, no—not until th' other day when he forgot an' ate English mutton and Irish potatoes!"—Medical Pickwick.

HILLPOT Quality
BABY CHICKS
Their Quality Means Your Profit!
When I specify quality as the first thing my chicks must have, it is because I know only a quality chick can pay the real profits you should get from every chick investment.
You can see that quality in every sturdy, vigorous Hillpot Chick.
It means Ease of Raising, Early Maturity, Heavy Laying, Winter Eggs—PROFITS.
You are not taking my word for this. These results have been secured by hundreds of my customers who re-order from me year after year, because my Hillpot Quality Chicks are paying—have always paid—them profits.
Send for my '26 Chick Book. Tells all about my profit strains of
Leghorns, Reds, Rocks, Wyandottes
Since old customers take so much of my production it will pay you to ACT PROMPTLY.

How much does a crop of stumps bring you?

PLOWING or mowing around stumps is "going around Robin Hood's barn"—it's the longest, hardest and costliest way.

Fields free from stumps and boulders give you better yields—first because you use *all* your land—and second because dynamiting these obstacles removes the breeding places of weeds, briers and crop-destroying vermin. *Clean* land gives you the chance to get the most out of your investment.

Du Pont dynamite blows out your stumps and boulders *right* — the job is done cheaply, quickly and easily. When you're ready to shoot stumps ask your dealer for du Pont dynamite and don't forget to look for the du Pont oval trademark on cartridge and case.

And send today for *new* "Farmers' Handbook of Explosives," a book that gives complete information about the use of explosives on the farm. It's free.

E. I. DU PONT DE NEMOURS & CO., Inc.

Equitable Bldg., New York, N. Y. Fulton Bldg., Pittsburgh, Pa., Harvey Bldg., Boston, Mass.

Better, Healthier Poultry and Stock

Fresh, ground Menhaden Fish, mixed with regular hog, poultry and cattle feed, supplies the proteins and minerals lacking in other than green feeds.

Struven's Fish Meal builds bone. It stimulates laying. Prevents leg weakness and rickets. 58 to 60% Protein. 6 to 10% Fats. 20% mineral. Less than 1% fiber.

Write for prices and free feeding instructions.
